THE INFLUENCE OF PRIMED GOALS ON ORGANIZATIONAL BEHAVIOR

Gary P. Latham, University of Toronto, Toronto – Canada

There is a "replicability crisis" in social psychology regarding the effect of primed goals on behavior. In addition, the charge has been made that the effect, where it does exist, is so fragile as to be arguably irrelevant. This is not the case in organizational psychology. I will review field experiments as well as those conducted in laboratory settings showing that primed goals have an additive effect with consciously set specific, challenging goals on the performance of employees in call centers. Moreover, the effect lasted for a 4-day work week rather than seconds/minutes. The effect was also found for a primed learning goal where the participants initially lacked the knowledge to perform the task. Finally, data will be reviewed suggesting that goal setting theory explains the primed goal-performance relationship. These experiments include exact as well as conceptual replications.
KEY002
VALUES AND PRO-ENVIRONMENTAL ACTIONS

Linda Steg, University of Groningen, Groningen – Netherlands

Why would people act pro-environmentally, even if this is associated with somewhat higher behavioural costs (e.g., money, time, or effort)? In this presentation, I will argue that various factors may motivate individuals to engage in such pro-environmental actions, and that values play a key role in this respect. I will elaborate on how values, and in particular biospheric values, encourage pro-environmental actions. Also, I will discuss factors that may activate or deactivate biospheric values, thereby increasing the likelihood of pro-environmental behaviour.
KEY003
ACTION AND INTENTION UNDERSTANDING: THE NEURAL MECHANISMS

Giacomo Rizzolatti, University of Parma, Parma – Italy
KEY004
ACTUAL VALUES AND ATTITUDES OF CZECH CHILDREN

Lenka Šulová, Charles University in Prague, Prague - Czech Republic

The paper introduces several interesting findings of a study conducted on 2,238 Czech children and adolescents in collaboration with the National Institute of Children and Youth Czech republic. The research project focused on identifying value orientations of 6-15 years old children. The central role played a family - the one in which a child lives, as well as the family the child itself is going to establish. What kind of partner and what kind of parent do children want to be? And do they want to become partners or parents at all? The survey was divided into five themes: 1. Family, 2. School, 3. Leisure, which was further divided into other sub-areas: Leisure time spent individually with parents, friends and Leisure time spent in an institution organized for leisure or informal education (institutions providing leisure activities), 4. Media, and these phenomena are essential socialization factors in children's life. The 5th part of the research is dedicated to life values and attitudes of children and adolescents. The paper will present selected results, explaining more general trends of contemporary children and adolescents.
KEY005
PAYING TAXES IN A CLIMATE OF MUTUAL COOPERATION

Erich Kirchler, University of Vienna, Vienna - Austria

Tax evasion and aggressive tax planning by globally operating firms have brought taxation to the top of the international policy agenda. How to combat non-compliance? Besides the application of deterrence measures and the necessity of building an international consensus on developing instruments to control and influence the strategic behavior of multinationals, it is necessary to establish a sense in society that tax avoidance and tax evasion are wrong. Mutual cooperation between authorities and taxpayers must become the binding social norm. Identification of citizens and residents with the norm needs to be strengthened by establishing a synergistic interaction climate. Successful establishment of mutual cooperation depends on power of authorities and citizens’ trust in authorities. It is argued that manifestation of legitimate power corroborates trust in authorities. Also manifestation of coercive power can strengthen trust and a synergistic interaction climate. However, the use of coercive power is a double-edged sword bearing the risk of an antagonistic interaction climate of “cops and robbers”.

KEY006
RESISTANCE TO CHANGE IN A WORLD OF CHANGE: UNRAVELLING OUR SECRET TRAUMATIC ATTACHMENTS

Felicity de Zulueta. King’s College London, London - United Kingdom

Dr Felicity de Zulueta is an expert on attachment and the crucial role it plays in the traumatic origins of violence as well as in its prevention. She will begin by presenting the evidence that shows the huge importance of the first 2-3 years of life in child development. By linking these results with the high rates of domestic violence in our society, she will outline how damage to the vital processes of attunement and mentalisation in infancy leads to violence in the home and its transmission down the generations. Her ending however is one of hope as she presents us with a new empowering, effective and relatively low cost approach to healing the wounds of these traumatized families which is now used across the UK and is being promoted in Northern Europe, Mexico, Ecuador, Greece and Italy. This particular approach, which uses our current video devices, illustrates so well how modern technology married to the latest neuroscientific research can promote powerful change in the field of psychotherapy across the social divide.
KEY007
HOW FAR CAN WE GET? A FUTURE PERSPECTIVE ON DIVERSITY AND COLLABORATION IN PSYCHOLOGY

Robert A. Roe, Maastricht University, Maastricht – Netherlands
KEY008
THE ORGANIZATION OF OBJECT KNOWLEDGE IN THE BRAIN:
DOMAINS AND ATTRIBUTES

Alfonso Caramazza, University of Trento, Rovereto – Italy; Harvard University, Cambridge - United States
KEY009
RISK PSYCHOLOGY

Christine Roland-Lévy, University of Reims Champagne-Ardenne, Reims – France

The presentation will deal with risk psychology, essentially from the perspective of social psychology. Besides a general introduction around the concept of risk and risk-taking a series of studies will be presented. Based on the Social Representation Theory, risk in general will be presented. The presentation will then develop around risk in the context of the financial and economic crisis. Examples of studies will also present risk-taking, with financial incentives around gambling. Finally, examples of the effects of risk-taking in sports will be presented.
THE VANISHING EFFECT OF RELIGIOUS IDENTITY ON PERSONAL VALUES: A STUDY OF PROTESTANTISM, CATHOLICISM, EASTERN ORTHODOXY, ISLAM, JUDAISM, AND NON-AFFILIATION

Shalom H. Schwartz, Hebrew University of Jerusalem, Jerusalem - Israel

Does people’s religion have an effect on what they consider to be the most important guiding principles in their lives? Does belonging to one religion or another lead to emphasizing different values? This talk will address these questions for the major Western religions. Most people, including many cross-cultural and cultural psychologists, think that religion has a profound effect on the value priorities of individuals. Some view religion as a critical source of value differences between nations and sub-national groups too. Are they right? I will tackle these questions with data from representative samples in over 30 countries, examining the value priorities of Roman Catholics, Protestants, Eastern Orthodox, Muslims, and Jews, and of those who profess no religion.
KEY011
EMPOWERING COACHING: THE DEVELOPMENT, DELIVERY AND IMPACT OF A THEORY-BASED INTERVENTION TO PROMOTE ADAPTIVE MOTIVATIONAL CLIMATES

Joan Duda, University of Birmingham, Birmingham - United Kingdom
Self-regulation has usually been studied in Euro-American samples. This is a shortcoming which is even more disturbing when conceiving of the self as culturally bound. Therefore, I will present culture-psychological approach conceiving of self-regulation as organizing personality development in cultural contexts. The main focus is on the developmental conditions and the function of self-regulation for culturally appropriate developmental outcomes. The culture-psychological and developmental relevance of self-regulation will be underlined by selected studies. First, I will discuss different aspects of self-regulation (e.g., behavior and emotion regulation) and its functions for different domains of developmental outcomes (e.g., social competence and academic achievement). Second, I will focus on socialization conditions, including parenting and the cultural context, for the development of self-regulation. Further, I will relate the relevance of cultural values and modes of the self, e.g., the independent and interdependent self-construal, for specific goals of self-regulation and the cultural meaning of self-regulation. Based on empirical studies, associations of children’s self-regulation with socialization conditions are discussed suggesting a theoretical framework for the development and function of self-regulation in cultural context. I will conclude with questions on universal and culture-specific processes underlying self-regulation as organizing individual development. The general discussion combines the lens of culture with the lens of development.
KEY014
MULTI-CULTURAL EXPERIENCES AND IDENTITIES:
PSYCHOLOGICAL DYNAMICS AND CONSEQUENCES

Verónica Benet Martínez, Pompeu Fabra University, Barcelona - Spain

This talk will review the psychological processes and consequences of being a multi-cultural individual and/or having multicultural experiences, while integrating relevant findings and theories stemming from cultural, personality, and social psychology.
KEY016
REVEALING VOICE: THE CASE OF SEXUAL ORIENTATION

Anne Maas, University of Padova, Padua – Italy

It is often argued that discrimination of minority groups on the job market can be reduced through appropriate recruitment procedures, including the reliance on audio-only interviews. But does audio technology really prevent discrimination? I will argue here that voice contains a host of social information that affects impressions and inferences in a pervasive and largely automatic fashion. Using auditory gaydar as an example, I will show that people are greatly inaccurate in identifying sexual orientation on the basis of voice alone. Yet, they draw strong inferences from masculine vs. feminine and straight vs. gay sounding voice about the speaker’s traits, preferences, likely diseases, and leadership abilities. Voice may even change the very meaning of what is being said.
In recent years, family has gained a prominent place in social sciences due to the rapid or even dramatic socio-demographic changes all over the world. In this scenario, what are the risk factors that may affect family well-being and the resources that the family can count on to fulfill its fundamental task, which is "to make human beings human"? The contribution involves two parts. The main findings regarding the link between family (i.e., couple and parent-child relationship) and well-being (i.e., physical and mental well-being) are presented in the first part, focusing on relationship quality, as well as on the constructs developed to examine it. The recent effort made by some scholars to pay attention to positive constructs (such as forgiveness and commitment) rather than negative constructs (such as conflict) allows a better understanding of the components of relationships in terms of relationship health. The second part of the contribution focuses on a perspective aimed not only at reaching a balance between the negative and the positive aspects of the relationships, but also at understanding the relationship “in itself” and promoting the good of the relationship. Fincham and Beach (2010) has proposed the idea of a true “positive relationship science” whose core construct is represented by “relationship flourishing”. In this regard, the “relational symbolic model” (Scabini & Cigoli, 2000) has provided new insights to the idea of “relationship flourishing” by identifying the specificities of “family relationship flourishing”. According to the “relational symbolic model”—whose core construct is “generativity”—the family is conceived as a multigenerational system. Generativity is an outcome of family relationships if these relationships realize their best potential; in the opposite case they produce degenerative outcomes. In this regard, generative well-being can be considered as a form of well-being produced by flourishing family relationships. Generative well-being occurs when family generativity (i.e., care and commitment towards the children) and social generativity (i.e., care and commitment towards the new generations) are connected to each other. Some research findings highlighting the two-fold role of family and social generativity are reported in the final part of the contribution.
Health-compromising behaviors are difficult to change. Theories assume that an individual’s intention to change is the best direct predictor of actual change. But people often do not behave in accordance with their intentions. This discrepancy between intention and behavior is due to several reasons. For example, unforeseen barriers could emerge, or people might give in to temptations. Therefore, intention needs to be supplemented by other, more proximal factors that might compromise or facilitate the translation of intentions into action. Some of these post-intentional factors have been identified, such as perceived self-efficacy and strategic planning. They help to bridge the intention-behavior gap. The Health Action Process Approach (HAPA) suggests a distinction between (a) pre-intentional motivation processes that lead to a behavioral intention, and (b) post-intentional volition processes that lead to the actual health behavior. In this presentation, studies are reported that examine the role of constructs, mechanisms, and interventions in the initiation and adherence to health behaviors (e.g., physical exercise, dietary behaviors, dental flossing). The general aim is to examine the effects of psychological constructs on health behavior change, based on various behaviors, time spans, and study participants from different countries.
KEY019
TOWARDS STRESS-MANAGEMENT TECHNOLOGY: PERSPECTIVES ON MEASURING AND ENHANCING THE HUMAN LIFE POTENTIAL

Anna B. Leonova, Lomonosov Moscow State University, Moscow - Russian Federation

The proposed hierarchical approach to construction of stress assessment and prevention programs integrates findings from three domains of contemporary stress research: ecological, transactional and regulatory paradigms (Leonova, 2003). Within this integrative framework, two complex psychological technologies – “Managerial Stress Survey” (MSS,) and “Individual Stress Resistance Promotion” (STRESIS) – have been developed and empirically validated (Leonova, 2007, 2012). We demonstrate how a rigorous implementation of this approach opens new perspectives on increasing human adaptation potential and wellbeing in different job/life situations. In particular, these technologies significantly enhance the motivational, self-regulatory and cognitive resources of the person.

ABSTRACT BOOK

STATE

OF THE ART
COMMUNITY PSYCHOLOGY AND SOCIAL WELL-BEING. ECPA (EUROPEAN COMMUNITY PSYCHOLOGY ASSOCIATION) EFPA ASSOCIATE MEMBER COMMUNITY PSYCHOLOGY STATE OF ART

Caterina Arcidiacono, Past President of ECPA (European Community Psychology Association), University of Naples Federico II, Naples – Italy

Community Psychology as well as the professional role of Community psychologists is a topic of increasing interest in our scientific domain. Community Psychology analyses the interaction among individual and social factors while proposing tools for social change as well as promoting justice, peace, democracy and social solidarity; it is a new discipline that pursues social transformative goals. Our question is why should psychology be interested in these objectives, given its natural inclination to study either individual well-being or psychic diseases. Our concern is to embed peoples’ individual, biological and psychological features in social context. Moreover, the aims and goals of Community psychology are to meet the changes of contemporary society. Being aware of the relationship between individuals and contexts, Community psychologists propose visions for the future of individuals, relationship and contexts by working as catalysts of social change and well-being. In that regard, Community psychologists propose visions, strategies and methods for working in health, social and educational contexts. The state of art proposed by ECPA (European Association of Community Psychology) will define goals and instruments of Community psychology to explore the need of specific training and development of peculiar competences. This state of art will also deepen what characterizes and makes the psychological competence peculiar for social well-being. How to act as experts on the interaction between individuals and contexts, and which contribution can psychology gain from the community psychology approach? Which professional training for the development of plans of action for Community psychologists in social setting as well as the dissemination of community psychology knowledge in the wider social field? An open debate on these subjects will be opened with all the audience.
SA002
PSYCHOLOGICAL RESEARCH ON SUBSTANTIAL ORGANIZATIONAL DEMOCRACY: INDIVIDUAL, SOCIAL AND SOCIETAL OUTCOMES

Wolfgang G. Weber, University of Innsbruck, Innsbruck – Austria

While several well-known research reviews focused upon moderate forms employees’ participation on the level of the workplace autonomy/control/decision latitude or the (self-managed/semi-autonomous) work group (see Theorell 2004 for a review), only little research exists on substantive democratic structures, where employees exercise influence over tactical or strategic decision-making in contemporary firms (for the latest, only limited, reviews see Freeman, 2007; Kruse, 2002). Concerning crucial predictors, the big majority of extant studies of organizational participation effects is based on restricted levels both of structurally anchored participation and employees’ individual participation in democratic decision making. In consequence, little is actually known about whether substantial organizational democracy, also compared to restricted levels of participation, is associated with potential outcomes like work motivation, value orientations, and organizational behaviour of employees, positively, and whether this may foster engaged citizenship orientations within and beyond the workplace (see Pircher-Verdorfer et al., 2013).

This state of the art contribution intends to reduce this serious organizational psychological knowledge gap. Design/Methodology - Based on an empirically tested typology of high participative and democratic enterprises (Weber et al., 2008; e.g. representative democracies like workers’ cooperatives, democratic reform enterprises, and basis-democratic employee-owned self-governed firms), an extensive free category literature recherché using PsycINFO and related sources (PsycArticles, Psyndex etc.) provided several hundreds of publications (1975 – Sept 2014), out of which only 52 publications proved congruent with our strict criteria of in-/exclusion (democratic organizational features beyond workplace or work group participation, psychological correlates and outcomes, quantitative data analysis incl. significance testing). Results - The results indicate that structurally anchored organizational democracy and perceived individual participation in democratic decision making is linked differentially with nine areas of outcomes. For example, reviewing the respective studies revealed that mere employee ownership does not guarantee that corresponding workers perceive a high level of individual influence and participation in tactical or strategic decisions. Whether this is the case or not depends also on the concrete system of representative or direct organizational democracy and further factors (like the following). Both representative and direct participation are positively associated with ethical organizational climate which also seems to represent a mediator concerning outcomes like commitment and prosocial work behaviours. Further, perceived direct participation is much more frequently related to several indicators of satisfaction, job involvement, and organizational commitment (instrumental model sensu Klein, 1987) than pure employee ownership status (intrinsic model) as the majority of findings shows. Mixed results support Pateman’s (1970) spillover hypotheses, partially, which lets assume that several third variables may influence the positive interrelation between organizational democracy, prosocial work behaviours and civic orientations toward societal or cosmopolitan issues. Further, only a few existing findings concerning health factors in democratic enterprises do not provide a clear picture whether structurally anchored democracy on the level of the organization is related to indicators of stress and health or not. While the spillover hypothesis framework (Pateman, 1970; cf. Weber et al., 2009), Klein’s (1987) three motivation models of employee ownership, the three-component model of organizational commitment (Meyer et al., 1993), or the concept of (individual!) psychological ownership (Pierce et al, 1991; 2001) each were addressed by five publications or more, surprisingly, the literature recherché indicates that several
prominent psychological theories or models that might prove highly relevant for the explanation of studied phenomena are nearly not considered within the reviewed studies (e.g., self-determination theory, theory of agency, activity/action theory, shared/distributed leadership and a lot of social-psychological concepts dealing with group and inter-group behaviour; for a discussion of possible theoretical advance in organizational participation theory see Weber & Jeppesen, 2014). Additionally, several methodological weaknesses were identified, e.g., complex constructs are often operationalised only superficially or questionably by means of a few or very heterogeneous items. Only a few longitudinal studies (which are not in accordance with present methodological standards) or multi-level studies were identified and nearly no quantifying process studies investigated the development of in-/dependent variables including their backlashes on democratic practices and structures. Further, we found a few hints on several mediators or moderators that need further investigation, like economic situation of the firm, ethically-oriented organizational climate, psychological ownership, attitudes toward participation, or work stress.

Limitations - Because nearly all existing studies use cross-sectional design, findings of this review allow no causal inferences, on the one hand. However, because democratic structure or individually perceived participation were significantly associated with hypothesized outcomes in several of the subject areas considered, the possibility of causal effects of organizational democracy could not be falsified, on the other hand. Research/Practical Implications - Notwithstanding that, several findings provide hints how organizational structures and cultures can be improved to foster employees’ satisfaction with their organization, work motivation, affective and normative commitment, job involvement, or prosocial and civic orientations. Further, a lot of possible differences between democratically structured and conventional enterprises seem to be nearly not researched, e.g. concerning organizational resilience, moral competences, collective psychological ownership, innovativeness, collective artefacts and knowledge exchange, emotional work, burnout, mobbing. Several propositions will be presented for future research.
Borderline Personality Disorder (BPD) is characterized by severe functional impairments, a high risk of suicide, extensive use of treatment, harm to others, and high costs to society. Current theories view dysfunctions in emotion processing and social interaction as core mechanisms of BPD. This often leads to prototypical behavioral patterns such as non-suicidal self-injury, high-risk behavior, and impulsive aggression. Research on psychological and neural mechanisms of BPD points towards an interplay between dysfunctional information processing, impairments of fronto-limbic circuits, and learned maladaptive behaviors. This presentation will give an overview of the latest research on mechanisms of emotion dysregulation and disturbed social interaction in BPD. Further, it will delineate new avenues of treatment approaches for BPD which combine the understanding of neurobiological and psychotherapy mechanisms. Examples of this, which will be depicted in the presentation, are fMRI-based neurofeedback, effects of DBT on neural mechanisms of emotion regulation, and computer-based training of social interaction.
Cognitive psychotherapy has been recently witness to the development of many new techniques and interventions, which make uncertain the existence of a unified theoretical model. In order to clarify the state of art, we will distinguish between strategic goals and techniques and tactics in psychotherapy which help to pursue these goals. Traditionally, Standard Cognitive Therapy had two main strategic goals: patient’s awareness of his/her way of functioning, and cognitive changes. More recently the focus on the self-maintaining processes of many disorders has led to add further strategic goals: acceptancy and the development of functional skills. Therefore, the overall picture of the procedure and techniques can be currently attributed to four strategic goals: awareness of the process underlying different disorders, cognitive changes, acceptancy, development of functional skills. The possibility of the development of a unified approach will be discussed on this light.
SA005
STIMULATING THE BRAIN, STIMULATING THE MIND

Giuseppe Vallar, University of Milan-Bicocca, Milan – Italy

In the last two decades, there has been an explosion of studies in healthy participants and neurological patients with focal lesions and neural dysfunctions, using non-invasive brain stimulation (NIBS: transcranial Magnetic/ Electrical Stimulation, TMS, tES) techniques, in order to temporarily interfere with behavior, with the aim of elucidating the neurofunctional basis of cognition. More recently, NIBS have been used as adjuvant treatments for improving and rehabilitating neuropsychological deficits such as aphasia, apraxia, and unilateral spatial neglect. NIBS are currently also used for attempting to increase level of performance, and for modulating higher aspects of behavior in healthy participants. These diverse sources of evidence, firstly, further elucidate the multi-componential architecture of the mind, and its neural basis, as experimental psychology and neuropsychology have done since their inception in the second half of the 1800. Secondly, the increasing amount of evidence that NIBS may selectively modulate and improve aspects of behavior of patients with a variety of neuropsychological and neurological deficits, both alone, and as adjuvant to behavioral treatments, opens novel perspectives to neurorehabilitation. These issues shall be illustrated and discussed through the results of experimental studies concerning the effects of NIBS on motor planning and execution in healthy participants, on ideomotor apraxia in brain-damaged patients, and on deficits of visuo-motor adaptation to a displaced visual scene. The emerging pattern in adult humans is that behavior and its neural bases may be modulated by NIBS, both increasing and decreasing level of performance, through effects on the stimulated cortical areas, and a set of connected regions, showing a remarkable amount of behavioral and neural plasticity, while basically preserving the functional architecture of cognitive and sensorimotor processes.
SA006
PSYCHO-ONCOLOGY: PRESENT AND FUTURE DIRECTIONS

Luigi Grassi, University of Ferrara; S. Anna Hospital, Ferrara - Italy

Over the last 30 years, a number of studies in psycho-oncology literature have indicated the need for a multidimensional approach to cancer, by taking into account the physical, psychological, interpersonal and spiritual implications determined by the disease and its treatment. At least 30-40% cancer patients and their families present in fact, emotional disorders that are associated to maladjustment, reduction of quality of life, longer rehabilitation time, poor adherence to treatment and abnormal illness behavior. Various types of psychosocial interventions have also been shown to be effective in reducing psychological symptoms and improving quality of life among cancer patients and their families. Psychosocial oncology, as the specialty aiming at studying the psychological, social and spiritual factors in cancer, has today a specific and unquestionable role, with psychosocial domains, including screening for distress, assessment and proper treatment, to be mandatorily integrated into routine care across the trajectory of cancer. Psycho-oncology has rapidly developed throughout the world and psycho-oncology services, programs and/or departments are available in most countries with the mission of providing specific activities in terms of clinical care, education and research. Guidelines and recommendations on psychosocial care in cancer have been also developed and endorsed by the national scientific societies of psycho-oncology (e.g. Canadian Association of Psychosocial Oncology; Italian Society of Psycho-Oncology) as well as national and international institutions (e.g. USA National Comprehensive Cancer Network Distress Management Panel; Council of the European Union Commission).
Borderline Personality Disorder (BPD) presents great challenges for clinicians. Patients with this diagnosis are known for being impulsive, reactive and highly sensitive. They often present with high risk behaviors, impulsivity, self-harming behaviors and a history of or risk of suicide attempts. PTSD and complex trauma issues need to be considered in the understanding and management of this population. Sometimes it can be difficult for clinicians to establish the connecting thread between the patient's symptoms (including the frequent difficulties they present in the therapeutic relationship) and the early environments in which they grew up, characterized by a high rate of attachment disruptions and severe traumatic events. People with BPD and a history of complex trauma have many difficulties with self-regulation and relating to others. The management of these self-regulation and relational difficulties are central aspects in the specific treatment of trauma and in general treatment of BPD. BPD symptoms can be treated effectively by reprocessing core targets with EMDR. The treatment of some of the most problematic symptoms such as impulsivity, self-harm, chronic emptiness, pathological idealization and dependence will be illustrated throughout clinical video examples.
EMDR Therapy has come a long way since the publication of the first EMDR related article 26 years ago, to being integrated in to the WHO guidelines for the treatment of PTSD in 2013. While pointing to several mile stones in its development, the lecture will focus on recent developments in the EMDR world: 1) the current support for the Adaptive Information Processing Model (the theoretical basis of EMDR Therapy), including the ACE study; 2) recent publications on EMDR Therapy focused research, including findings regarding major mental illnesses; 3) major developments in EMDR Therapy practice, including acute and group protocols; and 4) the spread of EMDR Therapy in the world. The lecture will end with a vision of possible future developments in the EMDR world and their potential impact on different areas including mental health, health, education and world peace.

HOW TO PROMOTE THE RESEARCH-PRACTICE TRANSFER: PANEL DISCUSSION WITH THE EFPA-EAWOP STANDING COMMITTEE ON WORK AND ORGANIZATIONAL PSYCHOLOGY

With the move towards evidence-based management, there has also been a push for improving the research-practice link in work and organizational psychology. One response to this push has been the establishment of the EFPA-EAWOP Standing Committee on Work and Organizational Psychology. Through this Standing Committee we hope to bridge the gap between science and policy (practice) by disseminating scientific findings in a comprehensible way to policy makers and regulators of the EU. The committee will provide a statement on how they see their role in supporting policy-making on issues related to individual and organizational factors impacting on worker's well-being and performance. This will be followed by a moderated discussion among the panel members on questions such as prioritizing topics, the speed-quality trade-off for providing information to policy-makers on short-term notice, the difficulty of providing general, simple, and exact evidence, and the implications on research, for instance focusing more on "wise interventions" (Walton, 2014). Finally there will be ample opportunity for the audience to interact with the panel.
Evidence-based practice is a systematic approach to clinical problem solving which allows the integration of the best available research evidence with clinical expertise and patient values. The Board of Scientific Affairs has undertaken to explore the current state of affairs with regard to Evidence-based Practice in Psychology in all EFPA member states. As part of this work, the Board has adopted the following definition, an extension of the American Psychological Association’s (APA) definition for all areas of psychology: “Evidence-based practice in psychology (EBPP) is the integration of the best available research with shared professional expertise in the context of client characteristics, culture, and preferences”. The aim of this Roundtable Discussion is to stimulate debate and seek information and feedback around the following four broad areas: (1) Education / training at graduate / postgrad level: (a) Is EBPP part of graduate/postgraduate/professional training? If it is, how is this training conducted? (2) Promotion of EBPP: (a) What does the organization do? (b) In what ways is EBPP promoted in your country? (c) Do you anticipate or have encountered problems implementing EBP? (d) Are there working groups in your association to promote EBPP? (e) Does your organization have an agreed definition of EBPP? (f) Does our definition encapsulate yours? Where do you see deviations? (3) Regulation of EBPP: (a) Is the delivery of psychological services regulated? By whom and how? (4) Monitoring EBPP: (a) Does continued professional training (CPD), allowing clinicians to keep up with research in their field, exist in your country? (b) To what extent is CPD monitored? (c) Who monitors? (d) Does member association support members in their CPD?
RT003
FINAL DRAFT OF THE INTERNATIONAL DECLARATION ON CORE COMPETENCES IN PROFESSIONAL PSYCHOLOGY

The International Project on Competences in Psychology (IPCP) has worked for two years to achieve an international agreement on which core competences shall be included in what is now being called the “International Declaration on Core Competences in Professional Psychology”. The project started with a working conference in July 2013, with representation from major international and regional psychology associations, and from some national associations. The project has since then been discussed at several open meetings held in various sites globally, and been reviewed in two rounds of consultations in a Reference Group consisting of 275 colleagues from all over the world. A “Final Draft” of the Declaration will be presented and discussed. The process will then enter internal phases of consultations in the International Association of Applied Psychology (IAAP) and the International Union of Psychological Science (IUPsyS). Hopefully the Declaration can be accepted by IAAP and IUPsyS in Yokohama 2016 in conjunction with the IPC2016 there.

SUPPORTING PARENTS WITH EVIDENCE-BASED INTERVENTIONS

E09. Health and clinical intervention - Positivity and well-being

Convenor  Lavinia Barone, University of Pavia, Pavia - Italy
Presenters  Femmie Juffer, Leiden University, Leiden - Netherlands
            Francesca Lionetti, University of Pavia, Pavia - Italy
            George Downing, University of Paris 8, Paris - France
            Maria Jose Rodrigo, University of La Laguna, Tenerife - Spain
Discussant  Maria Jose Rodrigo, University of La Laguna, Tenerife - Spain

Nowadays Europe is facing with major social challenges, as promoting inclusive, innovative and secure societies. For children’s well-being, promoting a secure society is related to the promotion of the quality of family relationships. In this context there has been recently a change of perspective in program promoting the quality of the parent-child relationship from vulnerability to resources, with the aim of preventing potentially at risk contexts to became harmful conditions for the family and the child (Downing, 2007; Juffer et al., 2008; Rodrigo et al., 2012; Barone & Lionetti, 2013). Meta-analytic inquiries report that preventive interventions on parenting are effective in enhancing parental sensitivity (Bakermans-Kranenburg et al., 2003) and in reducing children’s social-emotional and behavioural problems. They thus act on one of the major children's social capital, i.e. the family, in order to promote social inclusion and adequate social relationships (Pettit & Collins, 2011), with major economic returns for the society and welfare (Heckman & Masterov, 2007). As a witness of the increasing interest of Europe in prevention programs and practices, aiming at bridging the gap between science and practice, the main aim of the current symposium is to bring together the contribution in parenting program from four of the major European Countries, i.e. The Netherlands, France, Spain and Italy. Parenting program interventions for improving the parent-child relationship will be presented, and results sustaining their efficacy and/or effectiveness discussed.

ATTACHMENT-BASED-INTERVENTIONS: EVIDENCE FROM RESEARCH AND PRACTICE
Femmie Juffer, Marian J. Bakermans-Kranenburg, Marinus H. van IJzendoorn

Central to early-attachment based interventions is the assumption that a secure attachment relationship is an important basis for future development, especially in domains closely related to attachment, such as social behaviour. Thanks to attachment-based interventions, introduced in the current presentation, parents are supported to interact with their children in a sensitive way and to cope with emerging difficult behaviour.

VIDEO-INTERVENTION THERAPY FOR PARENT-INFANT, PARENT-CHILD AND COUPLE RELATIONSHIPS
George Downing

Video Intervention Therapy is one of the most widely practiced of today’s video-based methods. It is used in psychiatric services, substance abuse centers, home visiting programs, special programs for adolescent mothers, centers for autism and other disabilities, adoption and foster care, among other settings. This talk will give an overview with video illustrations.
AN EVIDENCE BASED GROUP INTERVENTION PROGRAM FOR AT RISK FAMILIES WITH YOUNG CHILDREN
Maria Jose Rodrigo, Miriam Alvarez, Sonia Byrne
We present the evaluation of “Growing up Happily in the Family” program for at-risk parents and their children aged 0–6 implemented in several Spanish Autonomic Communities. We also report the moderating effects of individual, family, neighborhood, group and facilitator characteristics on program results.

PROMOTING POSITIVE PARENTING: AN ATTACHMENT-BASED INTERVENTION WITH ADOPTIVE FAMILIES
Francesca Lionetti, Cinzia Alagna, Antonia Dellagiulia, Laura Rigobello, Lavinia Barone
An attachment-based intervention for adoptive families will be presented. The intervention is adapted from the Video-feedback Intervention to Promote Positive Parenting and Sensitive Discipline (Juffer et al., 2008) and currently extended to the adoption context, involving families of children who experienced multiple attachment ruptures.
IS002

BASIC DIMENSIONS OF SOCIAL JUDGMENT

A18. General issues and basic processes - Social judgment, impression formation, impression management

Convenor: Patrizia Catellani, Catholic University of Milan, Milan - Italy
Presenters: Andrea Abele, University of Erlangen-Nürnberg, Erlangen - Germany
Bogdan Wojciszke, University of Social Sciences and Humanities, Sopot - Poland
Marco Brambilla, University of Milan-Bicocca, Milan - Italy
Mauro Bertolotti, Catholic University of Milan, Milan - Italy
Nicole Hauke, University of Erlangen-Nürnberg, Erlangen - Germany
Patrizia Catellani, Catholic University of Milan, Milan - Italy

Research on the basic dimensions of social judgment greatly contributes to the advancement of our knowledge of self- and social perception, impression formation, stereotyping, information processing, and impression management through communication. This symposium presents recent developments in research on the basic dimensions of social judgment, connecting different areas of social cognition where these dimensions play a relevant role. In the first contribution the focus is on the definition and distinction of the basic dimensions and their components. Recent findings indicate that, within the broader domains of agency and communion, competence, assertiveness, sociability, and morality have distinctive importance in social judgments of others and of ourselves. The role of the basic dimensions in social interactions is then discussed, highlighting how the perspective taken by social actors influences their perception of others. The distinctive role of the morality sub-dimension in impression formation as well as in reputation monitoring is then focused on. Finally, the role of the basic dimensions and their components in communication and impression management are discussed, focusing on how each dimension can be affected by attacks and defences.

COMMUNION, AGENCY, AND SELF-ESTEEM. A LOOK FROM THE SUBCOMPONENTS
Andrea Abele & Nicole Hauke

Agency and communion are the fundamental dimensions of social judgment and agency dominates self-perception and self-esteem. We argue and show that agency (assertiveness and competence) and communion (morality and warmth) may be subdivided in two components with morality and assertiveness being more strongly related to self-esteem than warmth and competence.

THE DISTINCTIVE ROLE OF MORALITY IN SOCIAL JUDGMENT
Marco Brambilla

We investigated the distinct roles played by morality, sociability, and competence in forming impressions. Results show that morality and sociability make unique contributions to social judgment and that morality has a primary role over sociability and competence in the impressions that we form and the evaluations that we make of people.

HOW MUCH ARE WE CONCERNED IF OTHERS THINK WE ARE IMMORAL, COLD, INCOMPETENT OR UNASSERTIVE?
Nicole Hauke & Andrea Abele
We investigate if negative impressions that others form of the self lead to different concerns in dependence on the content of this negative impression. Since people are primarily interested in the communal traits of others, particularly in their morality, people should be especially concerned when others form a negative moral impression of them.

COMMUNION AND AGENCY AS BASIC DIMENSIONS OF SOCIAL COGNITION  
_Bogdan Wojciszke_

The emergence of agency and communion as basic content dimensions of social cognition is explained as a consequence of two perspectives universally present in social interaction – the agent perspective (of a person who performs an action) and the recipient perspective (of a person at whom the action is directed and who experiences it outcomes).

THE EFFECTS OF ATTACKS AND DEFENCES ON AGENCY AND COMMUNION DIMENSIONS  
_Patrizia Catellani & Mauro Bertolotti_

We investigated how communication affects the perception of agency and communion, and their sub-dimensions. Results show that attacks and defences focusing on a person’s morality, sociability, competence, and assertiveness have different effects on social judgments, depending on the importance attributed to each dimension and the professional category the target belongs to.
IS003
INTERGROUP CONFLICTS: CLASSIC THEORIES AND CURRENT PROBLEMS

C05. Culture and society - Group processes and intergroup relations

Convenor Francesco Paolo Colucci, University of Milan-Bicocca, Milan - Italy
Presenters Keren Sharvit, University of Haifa, Haifa - Israel
Loris Vezzali, University of Modena and Reggio Emilia, Reggio Emilia - Italy
Michael Skey, University of East Anglia, Norwich - United Kingdom
Monica Colombo, University of Milan-Bicocca, Milan - Italy
Simona Sacchi, University of Milan-Bicocca, Milan - Italy
Discussant Monica Colombo, University of Milan-Bicocca, Milan - Italy

Intergroup conflicts have the same importance today that Lewin attributed to them in 1946, but the current situation is profoundly different from what it was seventy years ago, and it is aggravated by a persistent phase of recession, not of development as in the post-war period. Intergroup conflict here does not denote the more general in-group/out-group bias, but rather real conflicts and the problem should be situated.

From the psychosocial point of view, this raises important issues that should be considered in order to understand intergroup conflicts: the problems of social identity and its relation to national identity, the perceived threat to security, the coping with distress from open conflict, the social perception in intergroup relations, the different methodological approach to this topic, and not least the intervention to implement contact between group. The symposium will discuss about these topics, building on the classic theories of Lewin, Allport, and Tajfel, and considering the contribution of recent theoretical and methodological developments.

A SENSE OF WHERE YOU BELONG IN THE WORLD: EXPLORING THE LINKS BETWEEN NATIONAL BELONGING AND ONTOLOGICAL SECURITY IN AN ERA OF MASS MOBILITY. Michael Skey
Recent debates around globalisation often overlook what 'thick' attachments to the nation offer. Using the concept of ontological security and data from a series of group interviews with members of the ethnic majority in England, I show how the take-for-granted idea of the nation continues to inform a wider sense of self, community and place.

THE ETHOS OF CONFLICT AND ITS ROLE IN COPING WITH DISTRESS IN INTRACTABLE CONFLICT
Keren Sharvit
The presentation will introduce the concept of Ethos of Conflict (EOC), which refers to a system of shared societal beliefs characterizing groups involved in intractable conflicts. The findings of the research program show that the EOC can serve as a barrier to collective guilt and shame in the face of harmful actions by one's ingroup.

INTERGROUP RELATIONS, NEW RACISM AND THE ETHNICIZATION OF SOCIAL CONFLICTS: A CRITICAL DISCOURSE ACCOUNT.
Monica Colombo
Critical discourse analysis has focused on the role exerted by the political elites and the media in the legitimization of xenophobia and ethnic dominance. Evidence of overt and covert forms of racist discourse will be presented. The implications of a critical discourse approach to the study of interethnic relations will be discussed.

HOW PHILOSOPHY CAN INFORM PSYCHOLOGY: SUPEREROGATION AND SOCIAL PERCEPTION
Simona Sacchi, Andrea Manfrinati, Marco Brambilla, Francesco Paolo Colucci
We investigated the effect of an individual’s hypermoral behaviour on group perception. Study 1 showed that participants perceived a moral agent as positive as the hypermoral one but they perceived the moral agent’s group better than the hypermoral agent’s group. Study 2 and 3 showed the consistency of the results across different intergroup situations.

AN INNOVATIVE INTERVENTION TO IMPLEMENT EXTENDED CONTACT AND FOSTER THE DEVELOPMENT OF CROSS-GROUP FRIENDSHIPS AMONG YOUNG CHILDREN
Loris Vezzali, Sofia Stathi, Dino Giovannini
We conducted an extended contact longitudinal intervention aimed at increasing cross-group friendships among young children. The intervention fostered the intention to meet outgroup members. Ingroup/outgroup norms and behavioural intentions mediated the effects of the intervention on the formation of cross-group friendships.
IS004
RESOURCE PROMOTION IN CHRONIC DISEASE ACROSS THE LIFE SPAN: INDIVIDUAL AND RELATIONAL DIMENSIONS

E09. Health and clinical intervention - Positivity and well-being
E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic disease

Convenor   Antonella Delle Fave, University of Milan, Milan - Italy
Presenters  Ernst Bohlmeijer, University of Twente, Enschede - Netherlands
           Evangelos C. Karademas, University of Crete, Rethymnon - Greece
           Lotta Uusitalo-Malmivaara, University of Helsinki, Helsinki - Finland
           Marta Bassi, University of Milan, Milan - Italy
           Ulrich Wiesmann, Greifswald University, Greifswald – Germany
Discussant  Giuseppe Masera, University of Milan-Bicocca, Milan - Italy

In spite of World Health Organization’s recommendations, the biomedical approach to health is still prevailing in most countries and health services. Physical and mental health are prominently evaluated as absence of disease, rather than conditions of well-being. Patients are treated for their pathology, disregarding how their social and family contexts, as well as their psychological features and subjective experience can influence disease course and outcomes. At the same time, and somehow paradoxically, the increasing prevalence of chronic and degenerative diseases poses new challenges to health professionals and institutions. The increasing percentage of citizens of all ages living with chronic diseases, matched with welfare systems’ resource limitations demand the attention of policymakers and practitioners. In the last two decades, increasing efforts were devoted to the identification of environmental and psychological mechanisms underlying health-related behaviours, in order to promote the agency and responsibility of individuals in maximizing their own health, and detect personal and social resources that can support well-being in chronic disease. This symposium aims at providing an overview of the most recent advancements in this domain. Presenters come from different research and professional backgrounds. The multiplicity of their perspectives will shed light on the complex and multifaceted needs and assets of the four main characters involved in the healthcare system: patients, physicians, caregivers, and educators. Moreover, the issue of resource promotion in chronic conditions will be analysed in the life-span perspective, through empirical evidence collected among children, adults and elderly people.

CHRONIC PATIENTS’ WELL-BEING AND PHYSICIANS’ INFORMATION SHARING
Evangelos C. Karademas
The Common Sense Self-regulation Model (CS-SRM) posits that chronic patients adapt better to illness if they develop adequate illness representations. The information provided by health professionals plays a crucial role in this process. Research findings clearly support the usefulness of CS-SRM based training among patients and practitioners.

MENTAL HEALTH IN CHRONIC DISEASE
Ernst Bohlmeijer
Positive psychology offers an evidence-based (public) mental health model that is complementary to the medical model. The primary focus is on enabling people with chronic diseases to live a pleasant, engaged and meaningful life. Evidence will be presented that mental health and mental illness are related but different continua, and related applications will be illustrated.
HAPPINESS IN CHILDREN WITH SPECIAL NEEDS

_Lotta Uusitalo-Malmivaara_

A summary of studies and correlates of happiness in special education (SEN) children compared with normally achieving children will be provided. The role of inclusive educational settings and social affiliation in improving SEN children’s subjective well-being will be highlighted, and implications for educational policy will be discussed.

A SALUTOGENIC ANALYSIS OF WELL-BEING IN OLD AGE

_Ulrich Wiesmann_

Resilience in the aging population is a growing concern for researchers and practitioners. Studies conducted from a salutogenic perspective among cognitively intact nursing home residents suffering from multiple chronic conditions showed that the sense of coherence mediates the resources-well-being relationship.

THE ILLNESS EXPERIENCE OF PATIENTS AND CAREGIVERS

_Marta Bassi_

Home-based health care in chronic conditions is increasingly encouraged in European countries. Findings from studies investigating illness perceptions and daily experience among patients and caregivers will be summarized. Their implications to design interventions promoting individual and family resources and well-being will be discussed.
IS005
MANAGING AND ASSESSING WORK RELATED STRESS IN EUROPE: STATE OF ART OF NATIONAL STRATEGIES

D4. Work and organization - Wellbeing at work

Convenor Sergio Iavicoli, Department of Occupational and Environmental Medicine, Hygiene and Health Psychology (EAOHP) - Italy
Presenters Cristina Di Tecco, Department of Occupational and Environmental Medicine, INAIL, Rome - Italy
José M. Peiró, University of Valencia, Valencia - Spain
Veronique Crutzen, Service Public Fédéral Emploi, Travail et Concertation sociale, Brussels – Belgium
Discussant Malgorzata Milczarek, European Agency for Safety and Health at Work, Bilbao - Spain

The last decades have seen significant developments in the economic, political, technological and social landscape, that have had an impact on the nature of work and the way people perform job leading to the emergence of new risks for health and safety in the workplace, including work-related stress and its consequences for workers’ health (ILO, 2010; Kompier, 2006). Stress represents the second most frequently work-related health problem after musculoskeletal diseases. In Europe the overall costs due to mental health disorders, including those that are not directly linked to work, are estimated to be 240 billion Euros per year, less than the half of which are linked to direct costs, such as medical treatment, while the loss of productivity for companies accounts for nearly 136 billion euros, including sick day absences (EU-OSHA, 2014). Following the EU Framework Directive 89/391/EEC, the European Framework Agreement of 8 October 2004 prompted to the inclusion of work-related stress and psychosocial risks in the agenda of the main international research institutes and OSH bodies. Thus, several initiatives and approaches were over time developed to provide policy makers, employers, trade unions, experts and employees with theoretical frameworks and practical tools for assessing and managing work-related stress risk. As a clear signal of the growing interest in Europe on work-related stress, the current EU-OSHA campaign focuses on managing stress and psychosocial risks at work, running under the title “Healthy workplaces manage stress”. This symposium aims to offer a portrait of the state of art on the management of work related stress risk in Europe in order to identify needs and challenges to move towards the development of integrated monitoring systems for health and safety at Europe level.

THE ASSESSMENT AND MANAGEMENT OF WORK-RELATED STRESS RISK IN ITALY: THE INAIL’S METHODOLOGY
Sergio Iavicoli & Stavroula Leka
The international debate on work-related stress risk has been rapidly expanding over the last decades. This presentation offers an overview of experiences and research activities on psychosocial factors and work-related stress risk in Europe.

TOWARDS EFFECTIVE AND SUSTAINABLE PREVENTION OF PSYCHOSOCIAL RISKS IN BELGIAN ENTERPRISES
Veronique Crutzen & Alain Piette
The missions of the DG Humanization of Work of the Belgian FPS Employment and Labour consist, amongst others, in setting a legal framework to ensure the safety and the health of the workers and in promoting well-being at work. This presentation will show how the FPS Employment tries to fulfil its missions regarding the complex issue of psychosocial risks (PSR).

CHALLENGES IN THE PSYCHOSOCIAL RISK ANALYSIS: SOME CONTRIBUTIONS FROM SPANISH PREVENLAB PSYCHOSOCIAL METHODOLOGY.
Josè Maria Petró
Psychosocial risk analysis confronts a number of challenges. Issues such as objectivity, accuracy, determination of the severity of the risks the comprehensive coverage of the different facet of the organizations and the triangulation of methods and informants require consideration when developing instruments. In this presentation the Prevenlab-Psychsocial methodology will be presented and the way it has dealt with some of these important issues.

THE ITALIAN RESEARCH EXPERIENCES ON THE ASSESSMENT AND MANAGEMENT OF WORK-RELATED STRESS RISK: THE INAIL’S METHODOLOGY
Di Tecco Cristina
This presentation will show the Inail’s methodology for assessing and managing work-related stress developed according to the Italian framework for health and safety at work and tailored to the Italian context.

“HEALTHY WORKPLACES MANAGE STRESS” – EU-OSHA CAMPAIGN
Małgorzata Mileczarek
In April 2014, EU-OSHA launched a 2-year campaign ‘Healthy Workplaces Manage Stress’ to raise awareness of the growing problem of work-related stress. In 2015, brand-new data of the EU-OSHA survey ESENER-2 focusing on managing psychosocial risks across Europe is to be published. Main publications, activities and the first results will be presented.
**IS006**

DEVELOPMENTAL AND BEHAVIOURAL IMPLICATIONS OF THE CIRCULAR MODEL OF VALUES

C.6 Culture and society - Attitudes and Values

Convenors  
Eldad Davidov, University of Zurich, Zurich - Switzerland  
Jan Cieciuch, University of Zurich, Zurich - Switzerland

Presenters  
Daniel Seddig, University of Zurich, Zurich - Switzerland  
Henrik Dobewall, Pompeu Fabra University, Barcelona - Spain  
Jan Cieciuch, University of Zurich, Zurich - Switzerland  
Michele Vecchione, Sapienza University of Rome, Rome - Italy  
Sonia Roccas, The Open University of Israel, Raanana – Israel

Discussant  
Shalom H. Schwartz, Hebrew University of Jerusalem, Jerusalem - Israel

In previous decades, research on values within social, personality, developmental and cross-cultural psychology has been greatly influenced by Schwartz’s (1992) value theory. Schwartz (1992; Schwartz et al., 2012) defined values as transsituational goals of varying importance, which serve as guiding principles in the life of a person or a group. Values differ from one another in terms of their motivational meaning and form a circular structure. Values are considered as one of the most important factors that influence our behavior. A fresh impetus for the value research has been provided by the refined theory of values proposed by Schwartz and colleagues (2012).

In our symposium we will discuss the behavioral and developmental implications of the value theory. Michele Vecchione with co-authors will present an 8-year longitudinal study on values and discuss various aspects of value stability and change over time in early adulthood. Jan Cieciuch with co-authors will present a longitudinal study on values in childhood and propose a preliminary outline of the model of value development, based on the Schwartz’s theory of values. Henrik Dobewall and Toivo Aavik will present the 3-year longitudinal stability in self- and other-rated values and argue that other-reports of values are not less stable across time than self-rated values or than other-ratings of traits. Daniel Seddig will present a longitudinal study on hedonism and leisure activities as predictors of perceived school problems among adolescents. The last presentation addresses the problem of value-behavior relations. Sonia Roccas and Lilach Sagiv will present direct and indirect mechanisms through which values affect behavior in various life-domains, and discuss personal attributes, situational factors and cultural contexts as moderators of value-behavior links.

**STABILITY AND CHANGE OF BASIC PERSONAL VALUES IN EARLY ADULTHOOD: A 8-YEAR LONGITUDINAL STUDY**

*Michele Vecchione, Guido Alessandri, Anna Doring, Shalom H. Schwartz*

The present study focuses on stability and change of basic personal values through young adulthood, from age 20 to 28 years. A sample of 270 young adults (54% females) with a mean age of 20.46 years (SD = .50) completed the Portrait Values Questionnaire at three time points, each separated by an interval of 4 years. We analyzed patterns of change within and between persons. Results: A medium-to-high rank-order stability was observed for all ten values, comparable to that reported in the literature for personality traits. The mean-level importance of conservation values (security, tradition, conformity) and self-transcendence values (benevolence, universalism) increased over time and remained stable for openness to change values (self-direction, stimulation, hedonism). Among self-enhancement values, the importance of power values decreased while the importance of achievement showed a slight decrease. No gender differences were found in the rate of change of the ten values. A
large percentage of respondents had a stable value hierarchy, indicating a considerable degree of ipsative stability. When considered from different analytic perspectives, stability and change of values appear to coexist with a prevailing pattern of substantial stability, particularly at increasing ages.

**TOWARD A MODEL OF VALUE DEVELOPMENT IN CHILDHOOD**

*Jan Cieciuch, Eldad Davidov, Rene Algesheimer*

The cross-cultural confirmation of the circular model of values (Schwartz, 1992, Schwartz et al., 2012) raises the question how the structure of values develops in early age. We address this question both empirically and theoretically. We conducted a longitudinal study with three measurement points on a group of 801 children aged from 7 to 11 in Poland. Values were measured by using the Picture Based Values Survey developed by Döring, Blauensteiner, Aryus, Drögekamp, and Bilsky (2010) to measure values differentiated based on Schwartz’s model. It turned out that the circular structure of values was present even at the first measurement occasion and did not change over time. The value priorities changed in concordance with the circle of values of Schwartz: An increase in a particular higher-order value was connected with a decrease in the opposing higher-order value. Especially, conservation decreased in importance while openness to change increased in importance in childhood. Regarding self-enhancement and self-transcendence, inverse curvilinear trends were observed.

By summarizing the empirical results and some theoretical considerations presented in the literature, we propose a preliminary outline for the model of value development based on the Schwartz’s theory of values. Development of values was in principle not discussed by Schwartz, however his theory provides a convenient framework for such a model. We discuss developmental implications of main claims of the theory: (1) the motivational meaning of values; (2) the differentiation between the structure of values and value priorities; (3) the circular continuum of values, and (4) the interpretation values as a core element of the latent culture. Based on the developmental interpretation of these theoretical elements we propose a description of the value development as a trade-off between basic motivations and the latent culture.

**RANK-ORDER CONSISTENCY AND PROFILE STABILITY OF SELF- AND INFORMANT-REPORTS OF PERSONAL VALUES IN COMPARISON TO PERSONALITY TRAITS**

*Henrik Dobewall, Toivo Aavik*

This study compares the 3-year rank-order consistency of informant-reports (i.e., judgments of other people – peers, spouses, siblings, parents, etc.) of values with stability estimates of self-rated values as meta-analytically reviewed and within the same sample. Whether the hierarchy of values attributed to an individual is as stable as in target's self-reports was assessed with profile correlations. Self- and informant-reports of personality traits were available for direct comparison. Results indicated that informant-reports of values were not less stable across time than self-rated values or than other-ratings of traits. This was true for the relative position of a person within a sample as well as the relative ordering of these measures within the same individuals. The observed longitudinal stability of informant-reports of values implies that they can serve as a reliable source of information. Moreover, the temporal stability of value/trait profiles (self- and other rated) was found to predict subjective well-being.

**HEDONISM, LEISURE ACTIVITIES AND PERCEIVED SCHOOL PROBLEMS**

*Daniel Seddig*

This study analyses the influence of hedonism on the perception of problems in school. As a value orientation hedonism is conceptualized to be a latent dimension directed on self-centered satisfaction, excitement and pleasant arousal. Accordingly, hedonism is considered to be a source of distraction from conventional goals regarding educational attainment and demands. The hedonists extrinsic motivation is expected to be related with an enhanced involvement in leisure activities, such as hanging out with peers and going to parties, that are consistent with the goals of hedonism. Such distractions from school requirements are assumed to be related with an increase in the perception of problems at school. The study uses panel data for a sample of German adolescents aged 14-17 to
analyse longitudinal structural equation models. First, a basic model is fitted to test the proposed (causal) mechanisms. Results indicate, that hedonism is a moderate antecedent of perceived school problems. A part of the influence is indirect, mediated by the involvement in extrinsic leisure activities. Leisure activities moderately affect the perception of school problems. Second, a multivariate latent growth curve model reveals that the developmental processes of hedonism, leisure activities and perceived school problems are interrelated during adolescence.

VALUES AS PREDICTORS OF EVERYDAY BEHAVIOURS
Ewa Skimina, Tomasz Rowiński, Włodzimierz Strus, Jan Cieciuch

The Schwartz’s (Schwartz at al., 2012) refined theory of values was recently used to study the relationship between values and behavior. In order to test this relation, researchers developed measures for behavioural tendencies that correspond to values distinguished on the circle and they presented the evidences that value preferences explain both self- and other-reported behaviour (Schwartz, Butenko, 2014; Torres, Cieciuch, Schwartz, 2014). In our study we applied another approach and verified whether values explain daily behaviours, that do not directly correspond to the values differentiated in the model of values (Schwartz at al., 2012). These behaviours were selected based on exploratory analysis of daily behaviour rather than theoretically recognized as motivated by specific values from the model. Furthermore, we checked what explains daily behaviours better - values or personality traits. The sample consists of 801 participants (56.7% female). They completed Portrait Value Questionnaire to measure values, Big Five Questionnaire-2 to measure personality traits and a pool of behavioural items from Goldberg’s Oregon Avocational Interest Scales. In regression analyses, behaviours were predicted by demographic variables in the first block and values (or personality traits) in the second block. Adding variables from the second block to the model, for each behavioural factor, it caused a significant increase of the explained variance of behaviour. Results were similar for both values and personality traits. Such findings indicate that values predict common, everyday behaviour at the significant level that is comparable to the personality traits.

HOW DO VALUES AFFECT BEHAVIOUR? DIRECT AND INDIRECT PATHWAYS
Sonia Roccas, Lilach Sagiv

The relationships between values and behaviour evoked much interest in the last decade. There is a growing body of research on the content of these relationships in a variety of life domains. Relatively little is known about the mechanisms that link values to behavior. The current research aims to shed light on the substantial, yet complicated, relationships between values and behaviour. We present some of the paths through which values affect behaviour, discussing both direct and indirect mechanisms. We point to personal attributes, situational factors and cultural contexts as moderators of the relationships between value and behaviour.
IS007
THE INHERENT PARADOX IN CASES OF CHILD ABUSE AND NEGLECT: THE VICTIM, THE PERPETRATOR, AND THE SOCIETY

B13. Development and Education - Child Abuse and Neglect

Convenor Rafael Art. Javier, St. John’s University, New York - United States
Presenters Amal O. Madani, Psychologist, New York - United States
Rafael Art. Javier, St. John’s University, New York - United States
Thomas A. Caffrey, Psychologist, New York - United States
Discussant Caroline "CC" Clauss-Ehlers, The State University of New Jersey, New Brunswick - United States

This symposium seeks to discuss the factors involved in child abuse and neglect that make the phenomenon difficult to understand, accept, and explain. A review of current statistics reveals that the phenomenon is pervasive nationally and internationally. These alarming statistics continue to challenge social and behavioral professionals to offer more comprehensive explanatory models and to provide more effective ways to address the immediate and long term psychological impact on those affected. In this symposium we will explore the social and legal factors, as well as individual and family dynamics that have made the phenomenon so pervasive. It is our contention that child abuse can only be understood in the context of the domestic violence syndrome and of the weakening of elements of our society that are expected to serve as the moral compass for the community. Thus, abuses to children by those in a position of authority (such as parents, family members, teachers, priests, law enforcers, etc.) constitute the most egregious violation. They poison the very atmosphere that is supposed to provide a sense of comfort, confidence, and trust. We will discuss in this context the manifestation of child abuse in child custody cases where the more acrimonious the conflict between the couples is, the more likely that children will be used as pawn in the family conflict. It leaves the child psychologically stunned and struggling with personal confusion, issue of trust, anxiety, and depression. We will discuss the long term consequences of this phenomenon in the lives of those affected even into adulthood.

UNDERSTANDING CHILD ABUSE AND NEGLECT WITHIN A CULTURAL AND SOCIOECONOMIC CONTEXT.
Rafael Art. Javier

There is a ‘cultural, social, and economic context’ in which child abuse and neglect takes place. This context influences and is influenced by ‘laws and procedures’ enacted by the specific society to dictate and guide the relationships of its members with one another, including the ‘view of male privilege’ and the ‘role of patriarchal society principles’ that guide one’s behavior toward one another in that society. It is in this context that we hear how perpetrators of child abuse in some cultures feel justified to engage in behaviors which result in great physical and psychological harm to children in the name of discipline, etc. This paper will examine relevant factors involved in the phenomenon, with particular emphasis on an analysis of the basic psychological characteristics in the perpetrator and the social context in which it takes place. Bullying and cyberbullying will be discussed in this context as component of the general syndrome inherent in child abuse. Finally, the paper will offer some intervention recommendations derived directly from the contextual framework guiding the paper.
CHILD ABUSE IN CHILD CUSTODY EVALUATIONS
Amal O. Madani
The area of child custody evaluations is an important arena where child abuse often comes to light. The presenter will discuss the multiple ways in which this issue could surface, and the necessary considerations and challenges involved in protecting children while retaining neutrality to serve the child’s best interest in an adversarial arena.

IMPACT OF CHILD ABUSE IN CRIMINAL BEHAVIOR
Thomas A. Caffrey
Just as society as a whole facilitates child abuse, child abuse in turn facilitates attacks on society as a whole. Like a soft-nosed bullet, abuse’s effects spread to impact multiple parts of society far beyond the victims themselves. One such impact is victims’ eventual criminal behavior. In this segment of the presentation, specific child abuse victims will be described in such a way that their abuse illuminates their eventual criminal behavior.
IS008
SOCIAL PSYCHOLOGICAL DYNAMICS OF HISTORICAL REPRESENTATIONS

C5. Culture and society - Group processes and intergroup relations

Convenor  Laurent Licata, Université libre de Bruxelles, Brussels - Belgium
Presenters  Laurent Licata, Université libre de Bruxelles, Brussels - Belgium
           Michal Bilewicz, University of Warsaw, Warsaw - Poland
           Silvia Mari, University of Milan-Bicocca, Milan - Italy
           Tibor Pólya, Institute for Psychology of the Hungarian Academy of Sciences, Budapest - Hungary
           Yechiel Klar, Tel Aviv University, Tel Aviv – Israel
Discussant  Federica Durante, University of Milan-Bicocca, Milan - Italy

Social representations of history are vital to form a group’s identity. They have a wide social and
political impact as they provide some of the cultural contents that accompany identity changes
following societal transformations. They are transmitted across generations through narratives that
contribute to define ethnic, religious, and national identities. These representations are often
fragmented between nations or ethnic groups. They elicit group-based emotions that influence
behaviours and may lead to intergroup conflicts or to reconciliation.

This symposium will gather five renowned social psychologists from Western and Eastern European
countries and Israel, all members of COST Action IS1205. It will address how historical
representations are related to present social psychological processes from different standpoints, and in
different settings. Silvia Mari will show how fascism is represented in contemporary Italy, and how
these representations serve social identity protection motives. Tibor Pólya will show how contents of
national history narratives vary as a function of the narrator’s level of national identification in
Hungary. Yechiel Klar will show that being exposed to the out-group’s historical narrative in the
Israeli-Palestinian conflict is cognitively costly, which partly accounts for people’s reluctance to take
the other’s perspective on history. Then Laurent Licata will present studies conducted among African
immigrants in Belgium, showing that minorities striving for recognition of their past victimization
may develop prejudice towards other minority groups uninvolved in their past victimization. Finally,
Michal Bilewicz will present Moral Exemplars Theory: being exposed to exceptional moral exemplars
– i.e. out-group members who acted in a moral way during a past conflict – improves intergroup
attitudes both among members of victim and perpetrator groups. Studies conducted in Turkey,
Armenia, Bosnia and Herzegovina, and Poland will be presented.

ITALIANS AND FASCISM: HOW CAN WE EXPLAIN THE LACK OF RESPONSIBILITY
AND GUILT FOR INGROUP MISDEEDS?
Silvia Mari, Federica Durante, Luca Andrighetto, Alessandro Gabbiadini & Chiara Volpato

We explored the failure of taking charge of the fascist misdeeds by the Italian ingroup. Study 1
investigated which groups/individuals are considered victims, perpetrators and bystanders of such
crimes. Study 2 tested the hypothesis that some mechanisms of moral disengagement may inhibit the
assumption of ingroup responsibility and prevent guilt.

NARRATIVE CONSTRUCTION OF GROUP HISTORY NARRATIVES AND THE
NARRATORS’ SOCIAL IDENTIFICATION
Tibor Pólya and Pál Kővágó
Recent research substantiates the view that the construction of group history narratives contributes to the definition of group identity. Our studies show that the construction of these narratives is also related to the narrators’ identification with the group. Results will be interpreted in terms of self-categorization theory.

ON THE DIFFICULTY TO CONTAIN THE HISTORICAL NARRATIVE OF THE OTHER SIDE IN INTRACTABLE INTERGROUP CONFLICTS
Yechiel Klar and Hadas Baram
We explore the consequences of uninvited exposure to the outgroup’s historical narrative (OHN). For example, participants exposed to the OHN consumed more glucose and made more spelling mistakes. Both behaviors were predicted by the perceived difficulty with the OHN. A new motivation for narrative closure measure was devised and tested.

LACK OF RECOGNITION FOR PAST VICTIMIZATION FOSTERS COMPETITIVE VICTIMHOOD AND SECONDARY ANTI-SEMITISM: THE CASE OF SUB-SAHARAN AFRICANS LIVING IN BELGIUM
Laurent Licata and Laura De Guissmé
We study how a sense of collective victimhood can drive minority group members (i.e. African migrants) prejudice toward groups uninvolved in past victimization (i.e. Jews). Survey results show that competitive victimhood is exacerbated by a perceived lack of ingroup victimhood recognition by host society, leading to more secondary anti-Semitism.

HISTORICAL MORAL EXEMPLARS AS A WAY OF IMPROVING CURRENT INTERGROUP RELATIONS
Michal Bilewicz, Sabina Cehajic-Clancy, and Marta Witkowska
Moral exemplars theory proposes that mere knowledge about non-stereotypical historical characters who acted in a moral way could repair current relations between conflicted groups because it leads to acknowledgement of historical moral variability. Convergent evidence from Turkey, Armenia, Bosnia and Herzegovina, and Poland is presented.
The contraposition between virtual spaces and face to face situations is definitively surpassed. Researchers interested in the use of technology have definitively understood that online and offline mutually influenced each other with the result that the space of interaction is expanded and enlarged and new conceptual environments emerged, where specific and complex phenomena may occur.

This symposium aims at analyzing these phenomena using original and complex theoretical lenses. In particular, both the social and educational perspectives are adopted. The social point of view is used to understand how people interact online, offline and into the edges spaces; how the sense of community is structured and how it evolves along the life span, distinguishing positive and problematic ways of using technology. The educational point of view is applied considering specific contexts, such as school and university. The intention is to answer to questions such as: What exactly means for students to replace books with new technology? What does it mean to learn online by performing collaborative activities? The double social and educational lens is indeed a crucial feature of this symposium. Each contribution uses both lens: Social phenomena are analyzed by looking also at the learning dynamics and educational situations are studied by considering the social dimension.

This symposium is a valuable occasion to analyze the interconnection between cyberspaces and offline situations by taking in account complexity and, at the same time, preserving the ecological dimension. Indeed, methodological issues concerning data collection and data analysis will be also discussed during the symposium.

A great collection of researches composes the symposium. Original data and results will be presented. Furthermore, interesting discussion is expected, able to provide new insights and to indicate possible innovative paths for understanding the role technology is playing in our society.

STUDYING INTERACTIONS IN EDGE ENVIRONMENTS FROM A PSYCHOSOCIAL POINT OF VIEW: EPISTEMOLOGICAL AND METHODOLOGICAL REFLECTIONS

Carlo Galimberti, Eleonora Brivio, Fabiana Gatti

Interactions nowadays take place simultaneously in face to face and in virtual environments. These two contexts create an edge environment, a mix between a real and a virtual environment. This contribution expounds on the epistemological and methodological changes needed in social research to study interactions when dealing with edge environments.

ON-LINE AND OFF-LINE LIFE: FROM INVERSE INSTRUMENTALITY TO FUNCTIONAL ORGANS

Martina Benvenuti, Elvis Mazzoni, Lucia Baiocco, Davide Cannata, Luca Zanazzi
Starting from the concepts of functional organs (Kaptelinin, 1996) and inverse instrumentality (Ekbia & Nardi, 2011), we present a study analyzing the use of social web during lifetime. In particular, the study explores processes underlying problematic uses of the social web compared to those developing and improving human abilities.

THE SCALE OF SENSE OF COMMUNITY IN UNIVERSITY ONLINE COURSES: FACTOR STRUCTURE
Stefano Cacciamani, Giulia Balboni, Vittore Perrucci
Aim of the study is to present the factor structure of the Scale of Sense of Community in University online Courses, developed according to the model of McMillan and Chavis (1986). Participants were 785 students. Exploratory and confirmatory factor analysis allowed to extract three factors: Membership, Fulfillment of needs, and Influence.

SCHOOL WITHOUT TEXT BOOKS: DIGITAL NATIVES VERSUS DIGITAL IMMIGRANTS
Michelle Pieri, Paolo Ferri
This contribution presents the Cobipad project ongoing in an Italian high school. Started in the 2012, the project will last three years. It involves high school where students use an Apple IPad instead of text books. Several focus groups were carried out with teachers, digital immigrants, and students considered digital natives. The main results will be presented.

POLYPHONIC COLLABORATIVE LEARNING: WEB-FORUMS AS DIALOGICAL SPACE
M. Beatrice Ligorio, F. Feldia Loperfido, Nadia Sansone, Giuseppe Ritella
The dialogical approach, in particular the concepts of “voices” and “polyphony”, has been extensively used in education (Ligorio & Cesar, 2013). These concepts can uncover some fine dynamics of collaborative learning. Qualitative analysis of web-forums, used by university students while performing online collaborative tasks, will be presented.
In recent years there has been a growing international interest for translational studies, for a richer information of public policy and health management on the basis of the results of relevant and reliable research. Specific attention has been devoted to rigorous experiments evaluating replicable programs and practices. To this purpose, various scientific efforts have been made to define standards of evidence that could be clearly structured and easily comprehensible for researchers and non-researchers. Those standards, involving efficacy, effectiveness and dissemination, can assist practitioners, policy makers, and administrators in deciding which interventions show better evidence and can be more convenient to adopt.

The symposium tries to provide an answer to this need focusing on high-quality evaluations of theoretically based interventions to prevent bullying and cyberbullying and presenting the most important models in four European countries.

Recent literature has shown that aggressive behaviours acted by peers may be experienced in both face-to-face and online interactions; for this reason adopting a specific focus both on bullying and cyberbullying appears to be the most promising direction for intervention with young students.

The five presentations will provide an overview of different models focusing on bullying and cyberbullying, based on face to face and virtual interventions. Specific attention will be devoted to an evaluation of the level of efficacy in the case of Italian and Belgian models and to an evaluation of effectiveness and dissemination for the Finnish and English models, the final presentation will present a systematic review of a new generation of computer simulator games used to prevent bullying and cyberbullying.

EVIDENCE-BASED INTERVENTION AGAINST BULLYING AND CYBERBULLYING: EVALUATION OF EFFICACY AND MEDIATION PROCESSES IN THE “NONCADIAMOINTRAPPOLA!” PROGRAM
Benedetta E. Palladino and Annalaura Nocentini
The presentation tries to provide an answer to the need of high-quality evaluations of theoretically grounded antibullying-cyberbullying interventions. We evaluated Noncadiamointrappola! program 3rd Ed. by adopting an evidence-based approach in analysing aspects related to the intervention’s efficacy and the mediational mechanisms involved.

FRIENDLY ATTACK: THE DEVELOPMENT OF AN EVIDENCE-BASED GAME AGAINST CYBER-BULLYING
Heidi Vandebosch
This presentation focuses on the Friendly ATTAC project, which aims at the development of a serious game against cyberbullying. Starting from the Intervention Mapping Protocol, we will discuss and illustrate the following steps: problem analysis, formulation of behavioral and change objectives, material development, and first evaluations.

KIVA ANTIBULLYING PROGRAM: SUSTAINABILITY AND LONG-TERM EFFECTS
Christina Salmivalli
Since the national roll-out of the KiVa antibullying program in Finland, data has been collected annually from students as well as school staff in schools implementing the program.
In the presentation, findings regarding the implementation quality and effectiveness of the KiVa antibullying program during the five years of implementation (2009-2014) will be presented and discussed.

AN EVALUATION OF BEATBULLYING’S MENTORING SCHEME IN SIX EU COUNTRIES
Fran Thompson, Peter K. Smith and John Jessel
As part of a DAPHNE III project, the UK charity BeatBullying is piloting an online mentoring scheme in Italy, Spain, Portugal, Romania, Poland and the Czech Republic. We are evaluating the delivery of the training and the impact of the mentoring scheme using online, self report questionnaires completed by mentors, adult mentors, counsellors and schools.

REDUCING BULLYING AND CYBERBULLYING THROUGH ARTIFICIAL INTELLIGENCE EDUCATIONAL GAMES: THE FUTURE OR A FAD?
Maria Sapouna
This paper will review a new generation of computer simulator games used to prevent bullying and cyberbullying such as FearNot! and SimBully. The paper will discuss the innovative ways in which these simulator games can be used with children and adults to provide them an insight into why bullying is happening and how it can be prevented.
IS011
COGNITION, EMOTION AND PROSOCIAL BEHAVIOR:
PERSPECTIVE OF GENDER

B05. Development and education - Moral development and prosocial behavior

Convenor: Vicenta Mestre, University of Valencia, Valencia - Spain
Presenters: Ana Tur-Porcar, University of Valencia, Valencia - Spain
Concetta Pastorelli, Sapienza University of Rome, Rome - Italy
Gustavo Carlo, University of Missouri, Columbia - United States
Maria Cristina Richaud, CIIPME – CONICET, Buenos Aires - Argentina
María Victoria del Barrio, National University of Distance Education (UNED), Madrid - Spain
Paula Samper, University of Valencia, Valencia – Spain
Discussant: Vicenta Mestre, University of Valencia, Valencia - Spain

There is a debate regarding the roles of sociomoral cognitions and emotions in understanding moral development. The relation among perspective taking, sympathy, prosocial moral reasoning, self-efficacy, prosocial behaviors and aggression were examined to show that cognitive processes and emotional processes are interrelated and predict both prosocial behaviors and aggression. Positive emotions act as protective factors or psychological resources (Fredrickson & Joiner, 2002) increasing the confidence in others and reducing impulsive and uncontrolled behaviors, and often they have been hypothesized to increase the likelihood of prosocial behavior.

The gender differences and attitudes toward individuals according to gender (sexism) are the important variables in adolescence. Sexism legitimizes and maintains the gender hierarchy through two complementary attitudes, defined by Glick and Fiske (1996) in hostile and benevolent dimensions. Discussion focuses on the relevance of both social cognitions and emotions in moral development in different countries, and the symposium will analyze the association between prosocial behaviors and family dynamics (parental support, autonomy, warmth) and gender differences.

To review some cognitive and emotional processes that regulate prosocial and aggressive behavior in adolescence and young adulthood.

To study the development of morality in different cultures. Cultural values and socialization practices might promote or emphasize moral motives deemed to be of particular significance in specific cultures.

To compare gender differences profile in cognitive, emotions and behaviors. The symposium approach the gender impact in positive and negative emotions, prosocial reasoning and prosocial behavior and aggression, with special attention hostile sexism and benevolent sexism.

To analyze the family dynamics that may be important for promoting positive development in youths.

RELATIONSHIP BETWEEN POSITIVE EMOTIONS, PROSOCIAL AND AGGRESSIVE BEHAVIOR AND SOCIAL SELF-EFFICACY IN ADOLESCENTS.

Maria Cristina Richaud

The aim is to examine how positive emotions are related to prosocial and aggressive behavior and these in turn to social self-efficacy. Specifically, to test a theoretical model that proposes that positive emotions promote prosocial behavior and diminish the aggressive one, and these in turn enhance or diminish social self-efficacy.
TRAJECTORIES OF PROSOCIAL BEHAVIORS FROM ADOLESCENCE TO YOUNG ADULTHOOD: THE PREDICTIVE ROLE OF FILIAL SELF-EFFICACY AND PARENTAL SUPPORT

Bernadette P. Luengo Kanacri
The current study explored diverse trajectories of prosocial behaviors (i.e., voluntary behaviors such as sharing, helping, consoling) and their association with family dynamics across four times of assessment (from age 16–17 to age 22–23) during the transition from adolescence to young adulthood.

PROSOCIAL TENDENCIES: PROSOCIAL REASONING AND EMPATHY

Paula Samper
We present the results of an empirical study with the aim of establishing the differential profile between male and female adolescents in prosocial behavior and its relationship to empathy and prosocial reasoning. Participants belonging to public and private schools of the Valencian Community. The results support the connections between prosocial behavior, empathy, and prosocial moral reasoning.

SEXISM AND PROSOCIALITY IN ADOLESCENCE

Ana Tur-Porcar
Scientific studies of contemporary society have consistently highlighted the prevalence of problems caused by sexist attitudes, both hostile and benevolent. We run a survey on 728 early adolescents. Results show that sexist attitudes are indicative of adolescents’ levels of empathy and prosociality.

EMPATHY AND AGGRESSION, DEPRESSION AND PROSOCIAL BEHAVIOR IN CHILDREN AND ADOLESCENTS

Victoria Del Barrio
The emotions are one of the most important problems in the social adaptation of children and adolescents. The aim of this paper is to study the relationship between empathy, aggression, depression and adapt social behaviour in children and adolescents.

THE DIFFERENTIAL STRUCTURE AND FUNCTION OF A MULTIDIMENSIONAL MEASURE OF PROSOCIAL TENDENCIES

Gustavo Carlo
The present study was designed to examine the structure and functions of a multidimensional measure of prosocial behaviors. Results showed that the hypothesized six-factor structure of the PTM-R had good fit, the best fit model as compared to alternative models, and that there were several unique patterns of relations between specific forms of prosocial behaviors and empathic concern, perspective taking, and the global measure of prosocial behavior.
IS012
ENTERPRISING PERSONALITY IN YOUTH: MAIN DIMENSIONS AND ASSESSMENT

A03. General issues and basic processes - Psychometrics

Convenor
José Muñiz, University of Oviedo, Oviedo - Spain
Eduardo García-Cueto, University of Oviedo, Oviedo - Spain
Ignacio Pedrosa, University of Oviedo, Oviedo - Spain
Javier Suárez-Álvarez, University of Oviedo, Oviedo - Spain
José Muñiz, University of Oviedo, Oviedo – Spain

Discussant
Luis Manuel Lozano, University of Granada, Granada - Spain

As pointed out by the Organization for Economic Cooperation and Development (OECD), fostering entrepreneurial spirit is fundamental to the development of market economies. The failure of an entrepreneur involves a cost to society in terms of lost opportunities and resources, and is detrimental to the individual, both economically and psychologically. Entrepreneurial behavior and attitudes of individuals are determined by different variables, some of them related to the cognitive and personality characteristics of the person, and others focused on contextual aspects. The aim of this symposium is to present the state of the art of enterprising personality assessment in youth, and propose a new measurement instrument for the assessment of eight enterprising personality dimensions: Achievement Motivation, Risk-taking, Innovativeness, Autonomy, Locus of Control, Self-Efficacy, Optimism, and Stress Tolerance. The symposium is articulated into four presentations. In the first presentation the theoretic framework and the state of the art of the enterprising personality field is established, and a new battery for the assessment of eight enterprising personality dimensions is presented. In the second presentation the relationships between the eight dimensions of enterprising personality and the Big Five personality traits are analyzed, using canonical correlation analysis and other multivariate techniques. In the third presentation the relationships between the enterprising personality dimensions and three Emotional Intelligence traits are studied in detail. Finally, a computerized Adaptive Test for the assessment of enterprising personality is developed. For the empirical studies mentioned above a sample of 2,693 students (51% males) from different regions in northern Spain was used. Mean age was 16.52 years (SD=1.38), with an age range of 16 to 23.

DIMENSIONS AND ASSESSMENT OF ENTERPRISING PERSONALITY IN YOUTH
José Muñiz
The aim is to present the state of the art of enterprising personality assessment in youth, and propose a new measurement instrument for the assessment of eight enterprising personality dimensions: Achievement Motivation, Risk-taking, Innovativeness, Autonomy, Locus of Control, Self-Efficacy, Optimism, and Stress Tolerance.

RELATIONSHIPS BETWEEN ENTERPRISING PERSONALITY DIMENSIONS AND PERSONALITY TRAITS
Javier Suárez-Álvarez
The main goal of this presentation is to analyze the relationship between the eight enterprising personality dimensions and the Big Five personality traits. The percentage of associated variance between enterprising personality dimensions and personality traits was 24%, with Emotional Stability being the most correlated trait.
OVERLAP BETWEEN ENTERPRISING PERSONALITY DIMENSIONS AND EMOTIONAL INTELLIGENCE

Eduardo García-Cueto

In this presentation the relationships between the eight enterprising personality traits and three dimensions of perceived emotional intelligence (attention, clarity and repair) are analyzed. The results show that common variance between both set of variables was 16%, and the way persons handle their emotions plays an important in enterprising personality.

COMPUTERIZED ADAPTIVE TEST FOR ASSESSING ENTERPRISING PERSONALITY

Ignacio Pedrosa

Using a Computerized Adaptive Testing approach (CAT), based on Item Response Theory models, offers important advantages in relation to classical psychometric models. In this presentation a Computerized Adaptive Test to assess enterprising personality was developed. The CAT developed requires an average of 10 items for assessing the construct.
**IS013**

**THE MEANING AND MEASUREMENT OF HUMAN CAPITAL**

The concept of Human Capital can be traced back as far as Adam Smith’s (1776) Wealth of Nations. This concept has been variously defined as: (a) the abilities and skills of any individual, especially those acquired through investment in education and training, that enhance potential income earning, (b) the collective skills, knowledge, or other intangible assets of individuals that can be used to create economic value for the individuals, their employers, or their community, (c) a measure of the economic value of an employee's skill set, the collective value of the organization's intellectual capital (competencies, knowledge, and skills, any stock of knowledge or characteristics the worker has (either innate or acquired) that contributes to his or her productivity, (d) intangible collective resources possessed by individuals and groups within a given population, (e) the capacity to work in organizations, obey orders, in short, adapt to life in a hierarchical/capitalist society, (f) the capacity to adapt, (g) all the knowledge, talents, skills, abilities, experience, intelligence, training, judgment, and wisdom possessed individually and collectively, the cumulative total of which represents a form of wealth available to nations and organizations to accomplish their goals, and (h) a treasure that a company or institution has available with respect to the qualifications of the personnel that works there.

Human capital is broadly regarded as being a critically important determinant of the success or failure of organizations. Yet, as the varying definitions laid out above suggest, there is considerable ambiguity in the definition and meaning of human capital. In this symposium, the authors and discussant argue that there is an urgent need to develop a clearer understanding of what human capital is, how it is measured and assessed and how it can be developed and put into action in organizations. The topic of human capital is one that has strong roots in psychology, but that spans multiple disciplines. This symposium will discuss the meaning and measurement of human capital from the perspectives of a multinational panel of psychologists (Grieff, Murphy), economists (Ederer), business administration (DeNisi) and talent management scholars (Kriek).

Explorations of the meaning and measurement of human capital are important for a number of reasons. First, it is widely thought that human capital is critical to the success or failure of organizations, but without a clear and concrete definition of human capital, it is not clear what this statement really means. There are good reasons to believe that at least some of that the characteristics of the workforce that are usually included under the label “human capital” are not important to the success or failure of organizations, particularly organizations in which work is structured in ways that fails to take advantage of human capital (e.g., traditional assembly organizations). If you consider the relatively modest resources organizations are often willing to devote to hiring, paying, retaining, and developing their workforce, it is clear that organizations often act as if human capital is not very important. The empirical question how important human capital really is, and how to best take
advantage of human capital is very difficult to settle with any precision, given the lack of consensus about what actually counts as human capital.

Second, one widely cited rationale for investments in education (outside of the workforce) and training (inside the workforce) is that it develops human capital, and therefore yields eventual payoffs to both organizations and national economies. Again, this argument may mean less than it seems. Without a clear understanding of what human capital comprises, the proposition that investments in education and training yield payoffs that justify their costs is a very difficult one to evaluate. It is also difficult to make evidence-based decisions about which training or education interventions are or are not worth pursuing, given the sometimes vague definitions of this construct.

Finally, different conceptions of human capital rely to a greater or lesser extent on “innate characteristics” of workers. For example, general cognitive ability is likely to be included in any well-defined version of “human capital”. Some attributes of individuals that are likely to be regarded as human capital are more difficult to develop or change over relatively short time periods, and definitions of human capital that place more emphasis on characteristics that are developed over long time periods and are relatively resistant to change (e.g., mental abilities, broad personality traits) will suggest different strategies for enhancing human capital than definitions that stress specific knowledge, skills that can be acquired and developed over relatively short time periods.

This symposium presents both empirical research on core skills that are becoming increasingly important in defining human capital (e.g., complex and collaborative decision making) and perspectives from four different perspectives (psychology, economics, business administration and talent management) on the meaning and the development of human capital. Panelists include: (1) Angelo DeNisi, Albert Harry Cohen Chair of Business Administration, Tulane University, New Orleans, LA, USA, (2) Peer Ederer, Honorarprofessor for Human Capital, Growth and Innovation at Zeppelin University, Friedrichshafen, Germany, (3) Samuel Grieff, Institute of Cognitive Science and Assessment (COSA), University of Luxembourg, Luxembourg, and (4) Hennie Kriek, CEO, Top Talent Solutions and Professor Extraordinarius at the Department of Industrial and Organisational Psychology at the University of South Africa, Pretoria, Republic of South Africa. The Chair of this panel (Kevin R. Murphy, Department of Psychology, Colorado State University, Fort Collins, CO USA) will also serve as discussant. In this role he will present an integrated model of human capital that reflects input from all four presenters.

HUMAN CAPITAL, PERFORMANCE MANAGEMENT AND FIRM PERFORMANCE: WHAT DO WE KNOW ABOUT THESE LINKS

Angelo DeNisi

According to the Random House Dictionary, the term “human capital” is defined as the “collective skills, knowledge, or other tangible assets of individuals that can be used to create economic value for individuals, their employers, or their community” (Dictionary.com, June 2014). The major focus of research and practice in the areas of performance appraisal and performance management has been to implement programs through which employees can improve their individual performance (and thus rewards), as well as improve the performance of the work group or (ultimately) the firm. Thus, these efforts can be seen as means of taking potential human capital and translating it into actual human capital. That is, the collective skills and knowledge of the individual employees must be managed in such a way that they produce improvements in individual and firm-level performance.

When viewed in this way, research on performance management can be seen quite differently. The variables that deserve the most attention, the relative importance of interventions designed to produce better measures, and the actual dependent variables in research all need to be re-considered and re-evaluated. My presentation will begin with a brief review of the literature from this alternative perspective. This review will conclude with a discussion of what we know about improving individual performance and what we know about leveraging such improvements to produce improvements in firm performance. The presentation will then move to a discussion of suggestions for research and
practice that might better enable us to use performance management interventions as a means of developing human capital potential, drawing upon some recent work in this area (DeNisi & Smith, 2014).

References

THE TRANSVERSAL SKILLS THAT UNDERLIE MODERN HUMAN CAPITAL
Samuel Grieff
Transversal skills such as complex and collaborative problem solving bear strong implications for human capital in the 21st century. We present theoretical background, assessment instruments, and empirical results on both skills as important marker of human capital of increasing importance in a rapidly changing world full of complexity. Complex and collaborative problem solving capture the potential of individuals to successfully interact and master new problem situations - either alone or in a team. We discuss implications and propose an agenda for contemporary research on human capital.

WHY THE COMPONENTS OF HUMAN CAPITAL ARE CHANGING
Peer Ederer
Changes in the nature of work are changing the definition and value of human capital. At least two trends in developed economies ensure us that problem solving skills as one component of human capital will be playing an increasingly important role in future production. First, digital technologies are complementary to tasks that require pattern-recognition, judgment, interpretation and decision. Second, countries increase their economic complexity by innovation and imitation, both of which processes demand problem solving skills. The consequence of these trends - a growing demand for problem solving skills - may be contributing to shortages of such skills if their human capital supply is inelastic. Such shortages would be reflected either in unusually high returns to problem solving skills, or else be alleviated by adulthood learning, in other words by being elastic. Our contribution illuminates empirical and conceptual evidence for the relevance and value of these skills.

HOW THE SEARCH FOR TALENT I IF CHANGING IN MODERN ECONOMIES
Hennie Kriek
Psychologists have made substantial contributions to organizations by helping them identify, recruit and retain top talent. This contribution is especially important because the value of human capital is not constant from one employee to another, but rather varies both as a function of the demands of the job and the contribution of that job to the organization’s success of failure (i.e., the ability to translate potentially valued characteristics of individuals into organizationally-valued outcomes) and because the characteristics that contribute to human capital differ across various parts of the organization. The general finding that jobs that contribute substantial value to organizations (or that entail the possibility of substantial losses) tend to attract and require individuals with high levels of intelligence, social skills, problem-solving ability and relevant knowledge has enabled psychologists to develop systems for talent acquisition and management that generalize across organizations. However, changes that are occurring in the landscape of human capital pose fresh challenges to psychologists involved in identifying and managing top talent.
This symposium will provide an overview of the current knowledge regarding the neurobiological bases by which information from the different senses is combined to enhance perception, attention, and actions in humans. In parallel, the symposium will provide a discussion of current directions in the application of multisensory research in clinical settings ranging from neuro-developmental disorders to aging and sensory loss. These advances have in many respects been fostered by multisensory research being at the forefront of innovations in signal analyses of brain mapping and brain imaging techniques. The presentations in this symposium will highlight this aspect. Micah Murray will provide a synopsis of evidence in favour of multisensory interactions occurring within primary cortices during the initial stages of stimulus processing and affecting functions from simple detection to memory encoding and retrieval. Durk Talsma will discuss the contributions of stimulus driven (bottom-up) vs. cognitive (top-down) influences on multisensory processing and how these factors can contribute to individual differences in multisensory processing capabilities. Nienke van Atteveldt will present an overview of neuroimaging studies that demonstrate the adaptive nature of multisensory interactions during reading acquisition. Amir Amedi will demonstrate using behavioural and imaging studies the multisensory task-based function of regions in the visual cortex of individuals with various degrees of visual experience using sensory substitution (encoding visual information in sound spectrograms) for tasks such as reading, object recognition and body-posture recognition. Finally, Mark Wallace will discuss how multisensory processes are affected in both normal aging and in autism, and how multisensory-based remediation methods may hold promise as tools to improve cognitive and perceptual function.

THE BEHAVIORAL RELEVANCE OF AND SINGLE-TRIAL LEARNING FROM MULTISENSORY PROCESSES

Micah M. Murray

Behaviourally-relevant multisensory processes occur in (near)primary cortices, as revealed by EEG, fMRI, and TMS. Multisensory processes based on single-trial learning predict and enhance later object recognition. Together, these data underscore how multisensory research is changing long-held models of functional brain organization and perception.
INDIVIDUAL DIFFERENCES IN TOP-DOWN CONTROL OF MULTISENSORY PROCESSING

*Durk Talsma*

Previously, we have shown that audiovisual processing can depend on several cognitive processes, including attention and memory. Moreover, individual persons differ considerably with respect to their multisensory processing capabilities. Here we discuss to whether these individual differences depend on variations in perceptual vs. cognitive ability.

INTEGRATION OF SPEECH AND SCRIPT IS ADAPTIVE TO CULTURAL AND INDIVIDUAL VARIATION

*Nienke van Atteveldt*

Neuroimaging research suggests that literacy acquisition interacts with evolutionary older brain systems for audiovisual and speech processing. These interactions are highly adaptive, as they differ across scripts and correlate with individual reading fluency. This underlines the flexible and experience-dependent nature of multisensory interactions.

HOW ENCODING COLOR VISION AND SHAPES IN SOUND SPECTROGRAMS CAN HELP US UNDERSTAND BRAIN ORGANIZATION AND RESTORE VISION IN BLIND

*Amir Amedi*

Recent behavioural and imaging studies suggest that brain regions usually considered "visual" are actually task-based. This task-based organization is revealed by teaching blind participants to use visual-to-auditory Sensory Substitution Devices for tasks such as reading & body-posture recognition and exploring the neural correlates using fMRI.

CHANGES IN MULTISENSORY FUNCTION ACROSS LIFESPAN AND IN THE CLINIC

*Mark T. Wallace*

This talk describes how multisensory function changes from early development through old age, and how multisensory dysfunctions play an underappreciated role in clinical conditions like autism. The talk further highlights how multisensory-based training can be a powerful interventional tool to improve sensory, perceptual and cognitive abilities.
In the present symposium we aim to understand how socialization processes, individual characteristics, social contexts and culture may prompt, cultivate, or discourage children adjustment. There is a wealth of evidence indicating that socialization processes are related to children adjustment (Gershoff, 2002). However in the last twenty years longitudinal and cross-sectional research has revealed more complex relations. In particular, the role of individual child and parents’ characteristics as well socio-cultural factors have been considered. For example, on the one hand, parents’ characteristics (e.g., depression and irritability) may interfere with their ability to respond adequately to the needs of their children and affect their psychological well-being. On the other, hand, living in violent communities may influence the way parents exercise their parental behavior and, consequently, how well they are able to contrast their children’s maladjustment. Furthermore, as revealed by Lansford et al. (2005; 2010), culture-specific normativeness of a parental behavior may moderate the association between parenting and child adjustment.

Finally, a recent promising line of research is investigating the degree to which children’s adjustment might vary as a function of family type. Empirical evidence supports not significant differences in parenting skills among groups of gay, lesbian, and heterosexual parents, nor in key child developmental outcomes (Goldberg et al.,2011; Tasker, 2010).

The invited speakers of this symposium will cover a wide range of the aforementioned topics to promote better integrated knowledge among professionals on the most consolidated and up-to-date empirical studies in this field.

---

**SWEDISH CHILDREN’S AGENCY: PARENTAL WARMTH, SCHOOL ACHIEVEMENT, AND ADJUSTMENT**

*Sevtap Gurdal, Jennifer E. Lansford, Emma Sorbring*

Using three waves of data collected when children were ages 8, 9, and 10, this study found that Swedish mothers’ and fathers’ warmth was related to their children’s agency, which was related to internalizing, externalizing, and school achievement.

---

**PARENTAL IRRITABILITY, HARSH PARENTING, AND CHILD MALADJUSTMENT**

*Concetta Pastorelli, Eriona Thartori, Valeria Castellani, Laura Di Giunta, Carolina Lunetti, Jennifer E. Lansford*

Using multiple waves of data collected with Italian family triads (Rome sample), this study examined the relations between maternal/ paternal irritability, harsh parenting (physical discipline and psychological aggression) and children’s externalizing and internalizing symptoms.
A BI-CULTURAL EXAMINATION OF POTENTIAL EARLY CUES OF DEPRESSION IN INFANTS OF INADEQUATELY RESPONSIVE MOTHER
Authors: Emma Baumgartner, Stefania Sette, Fiorenzo Laghi, Carol Lee, Summet Farwaha, & Yvonne Boh.
The present study examined, in a sample of mother-child dyads from two different countries (Italy and Canada), the relation between maternal response to infant’s distress and infant’s cues during a teaching task. Relations between maternal sensitivity and stress, social support, and infant’s age and country of origins are also discussed.

EXPOSURE TO COMMUNITY VIOLENCE, PARENTAL MONITORING AND ANTISOCIAL BEHAVIOR: A LONGITUDINAL STUDY
Maria Concetta Miranda, Dario Bacchini, Gaetana Affuso
The present study examined, with cross-lagged analyses based on three waves over a 3-years period, the reciprocal influence of exposure to community violence, parental monitoring and antisocial behavior in adolescence.

FAMILY AND CULTURE LEVEL CONTRIBUTIONS TO CHILD ABUSE AND NEGLECT: A LONGITUDINAL STUDY IN NINE COUNTRIES
Using data reported by mothers, fathers, and children in nine countries (China, Colombia, Italy, Jordan, Kenya, Philippines, Sweden, Thailand, and United States), we examined multiple levels of influence in the prediction of child abuse and neglect.

FAMILIES OF LESBIAN AND GAY PARENTS AND FAMILIES OF HETEROSEXUAL PARENTS: PERCEIVED PARENTING COMPETENCIES, COUPLE COMMITMENT, AND CHILD WELL-BEING
Roberto Baiocco, Federica Santamaria, Fiorenzo Laghi, Emma Baumgartner
This study examined the attitudes toward LG parenting in a sample of lesbians and gay men with children; in addition the group of homosexual parents were compared with a similar group of heterosexual parents.

San          Angel – Mexico
Discussant  Marco Depolo, Alma Mater Studiorum - University of Bologna, Bologna - Italy

Psychology has made a major contribution to the development of human resource management (HRM) and in particular to the burgeoning body of research linking HRM and organizational performance. Notable contributions include research findings relating to best practice concerning selection, training and learning, performance appraisal and motivation and rewards. However developments have generally given priority to practices that enhance performance, using workers as a means to this end. It is important to pay more attention to the needs and perspectives of the employees. In the European Union, the number of young adults is decreasing significantly and in contrast, the number of people aged 55 and over is growing rapidly (Schalk et al. 2010). In this context, companies had to reconsider the human capital, increasing the knowledge, the skills and experience of older workers on the hand, and the flexibility and the desire to learn of younger workers. The human resource practices need to be more sensitive to the needs, expectations and demands of the different age groups.

The contributors to this symposium will present result of recent research about the influence of Human Resources Practices on employees’ performance and wellbeing, taking into account the moderating role of age in those relations and their actions to improve them. Special attention will be paid to the analysis of impact of the different HR practices on employees of different age groups. This issue is of great relevance nowadays in Europe given the increase rate of aged people in the composition of the labor force.

HUMAN RESOURCE MANAGEMENT AND THE HAPPY PRODUCTIVE WORKER
David Guest
This paper argues the need of rebalancing the contribution of psychologists to give greater weight to the extensive research on HR practices that positively affect worker outcomes, including worker well-being. To this end, research is reviewed and new research presented that explores the extent to which it is possible to put in place policies and practices to ensure that workers are both happy and productive.

THE RELATIONSHIP BETWEEN HUMAN RESOURCES PRACTICES AND WELLBEING.
A LIFE-SPAN APPROACH
José M. Peiró, Nuria Tordera & Laura Lorente.
Age is an important variable to understand the employees’ motives, attitudes and behaviors at work and their work valued outcomes. Human resources practices in organizations are important means through which companies manage the relationships, expectations and promises of employer and
employees. In this study we examine the relationship between human resources practices, age and wellbeing in 3 different cohorts of Spanish workers. Results show significant differences in how human resources practices are appraised and valued by workers of the age groups.

**JOB CRAFTING AND CREATIVE PERFORMANCE: THE MODERATING ROLE OF AGE**  
*Emanuela Ingusci, Isabel Rodríguez, Alessandro Gennaro, Amparo Caballer, Esther García*

When employees perform creatively, they suggest new procedures that enhance an organization’s ability to respond to the opportunities coming from labor market. In job crafting, employees modify aspects of their jobs to improve the fit between the characteristics of the job and their needs, abilities, and preferences. We aim to explore this relationship in a sample of workers, in the different age groups. Results and implications are discussed.

**SO JUSTLY TREATED SO HAPPY AND SATISFIED”, OR NOT? MODERATING EFFECTS OF AGE AND JOB CATEGORY**  
*Maria Felisa Latorre Navarro*

The present study analyses the relations between perception of justice in work organizations and happiness and job satisfaction in a sample of Mexican employees. Literature suggests that these relations are moderated by age and job category. However, the moderating role may be different for different types of justice. The results show that the moderating role of age and job category is just significant for the relation between distributive justice and happiness and satisfaction. These results question previous research and highlight the differential importance of justice for wellbeing.
IS017
THE QUALITY OF LIFE AND WELL-BEING AMONG CHILDREN AND YOUTH IN EUROPE: WHAT DO WE KNOW AND HOW SHOULD WE APPLY THIS KNOWLEDGE?

F01. EXPO 2015 Hot Topics - Capacities building and human development

Convenor Lea Pulkkinen, University of Jyväskylä, Jyväskylä - Finland
Presenters Frosso Motti-Stefanidi, University of Athens, Athens - Greece
Lea Pulkkinen, University of Jyväskylä, Jyväskylä - Finland
Michiel Matthes, Alliance for Childhood European Network Group, Brussels - Belgium
Sabine Walper, University of Munich, Munich; German Youth Institute Munich, Munich - Germany
Discussant Tuomo Tikkanen, Finnish Psychological Association, Helsinki - Finland

In the global and economic perspective, most European children have secure and prosperous lives. However, there remain a number of children who face multiple adversities. The analysis of factors affecting a person’s well-being involves a consideration of both proximal factors with a direct impact on children and youth and more distal factors that affect children and youth indirectly. There are a wide range of studies on child well-being and health and factors affecting them, but most studies are cross-sectional. There is a need for a longitudinal research of the qualities of living conditions and their associations with individuals’ life styles and physical and psychological well-being, because problems in them tend to accumulate in certain individuals and sub-groups. They affect individuals’ work careers and parenthood, through which they are transformed into the life conditions of the next generation. The objectives of the symposium are, first, to analyze children’s adaptive success and resilience and their association with the type and level of risks and stressors that they experience in their life course and the continuity of adaptive functioning over time. Second, the way developmental tasks of an earlier stage are solved, sets the stage for the way developmental tasks of later stages will be adapted to. Therefore, we analyze the cascading consequences of success or failure in dealing with these tasks across multiple domains such as education, various capacities, and psychological well-being. Third, it is vital that policies are aimed at helping children to do well, as this lays the foundation for their success later in life. In EU member states, policy making and policy implementation by governmental and other agencies tend to take place in silos and in a compartmentalized way where children are concerned. We analyze a need to develop an approach that encompasses the whole child and the whole living environment of the child in which he/she grows up.

ADAPTATION AND WELL-BEING OF IMMIGRANT AND NONIMMIGRANT ADOLESCENTS DURING THE GREEK ECONOMIC CRISIS
Frosso Motti-Stefanidi & Jens B. Asendorpf

We examined how immigrant and nonimmigrant adolescents’ adaptation and well-being changed during the Greek economic crisis. The comparison of two cohorts (N=2000, 12 yrs, nested in 60 classrooms), one examined before and the other during the crisis, showed significant changes both in context and students’ adaptation, some in a positive direction.

ECONOMIC PRESSURE AND COPARENTING IN SEPARATED FAMILIES
Sabine Walper & Alexandra Langmeyer
Parental separation and subsequent family transitions put children’s wellbeing at risk, but effects are not homogenous. This paper focuses on the mediating role of economic deprivation and coparenting in children’s coping with parental separation. In two German studies cooperative coparenting was a resource for children but a challenge for parents.

Polarization of Individual Differences in Well-Being
Lea Pulkkinen & Katja Kokko
Polarized individual differences in physical and psychological well-being were found in midlife in the Jyväskylä Longitudinal Study of Personality and Social Development. Adversities had accumulated in about 10 percent of the sample. Critical indicators of this process were investigated. Knowledge can be applied to promoting positive development.

Improving the Quality of Childhood in Europe
Michiel Matthes (Alliance for Childhood European Network Group, Brussels, Belgium)
There are many institutions that provide services for children in each state, but most of them work on their own without connecting philosophy. There are also many NGOs working on the theme of children, and each organisation has its own perception of the child. Horizontal and vertical connections are needed to lobby for the quality of childhood.
According to Bandura, self-efficacy is "the belief in one’s capabilities to organize and execute the courses of action required to manage prospective situations." In other words, self-efficacy is a person’s belief in his or her ability to succeed in a particular situation. Bandura described these beliefs as determinants of how people think, behave, and feel (1994). Performing a task successfully strengthens our sense of self-efficacy. However, failing to adequately deal with a task or challenge can undermine and weaken self-efficacy. Witnessing other people successfully completing a task is another important source of self-efficacy. Self-efficacy has been shown as one of the essentials determinants of child and adolescent adjustment. It is related to self-esteem, autonomy, and security when facing with a problem. The objective of this Symposium is to study the role of self-efficacy in the development of different processes in the adolescence. It will be analyzed how self-efficacy promotes prosocial behavior and defends from negative emotions. At the same time it will be presented results about males and females adolescents trajectories of prosocial behaviors and their association with regulatory and assertive self-efficacy believe. Moreover it will be studied the relationship of self-efficacy with maladjustment: anger, depression and suicide risk. Finally it will be analyzed the role of self-efficacy, eustress, and flow in academic achievement.

NEGATIVE EMOTIONS AND BEHAVIOR: THE ROLE OF SELF-EFFICACY

Vicenta Mestre, Paula Samper, Anna Llorca

This study aims to test that self-efficacy promote prosocial behavior and diminish the aggressive one, and analyze the relationships between emotional self-efficacy, negative emotions (anxiety, depression, irritability) and behavior. The sample included Spanish adolescents students (age: 16-18 years).

MALES AND FEMALES TRAJECTORIES OF PROSOCIAL BEHAVIORS FROM ADOLESCENCE TO YOUNG ADULTHOOD: ASSOCIATIONS WITH REGULATORY AND ASSERTIVE SELF-EFFICACY BELIEVES

Concetta Pastorelli, Bernadette P. Luengo Kanacri, Nancy Eisenberg, Rosalba Cervaolo, Eriona Tarthori, Gian Vittorio Caprara

The study explored diverse males and females trajectories of prosocial behaviors and their association with regulatory and assertive self-efficacy believes across eight times of assessment from adolescence to young adulthood. The results highlighted the role of perceived efficacy believes on adolescence.
SELF-EFFICACY AND ITS RELATIONSHIP WITH ADJUSTMENT IN SPANISH CHILDREN
Maria Victoria Del Barrio, Miguel Angel Carrasco
It will be considered the specific relationship between self-efficacy and two common child and youth emotional disorders: depression and anger. The results indicated that self-efficacy appears as a shield for depression and this becomes more apparent with age. Regarding anger it appears to inhibit self-efficacy in all fields except the sports efficiency.

ROLE OF SELF-EFFICACY WITH TEEN SUICIDE RISK
Silvia Viviana Pugliese
The objective was to compare the characteristics of personality and expectations of adolescents admitted in the hospital for "suicide attempts” and adolescents non-patients. Results indicated that adolescents with suicide attempts have labile personality structure, weakening of inhibitory mechanisms which interfere both motivation and self-efficacy.

THE MEDIATED ROLE OF FLOW IN THE RELATIONSHIP BETWEEN SELF-EFFICACY, EUSTRESS AND ACADEMIC ENGAGEMENT
Belén mesurado, Maria Cristina Richaud
This study aims to test a theoretical model about self-efficacy and eustress promote both flow and engagement in school, and that in turn the flow state could promote the engagement in undergraduate students. Results show that self-efficacy has a positive effect on flow and engagement and that eustress has a differential role in academic setting.
IS019
SYMPOSIUM FISS ITALIAN FEDERATION SCIENTIFIC SEXOLOGY - DISCUSSING SEXUAL HEALTH AND WELLBEING

E21- Health and clinical intervention - Sexual Health

Convenor Roberta Rossi, FISS, Italian Federation of Scientific Sexology, Rome - Italy
Presenters Adele Fabrizi, ISC, Institute of Clinical Sexology, Rome - Italy
Antonio Prunas, University of Milan-Bicocca, Milan - Italy
Davide Dettore, University of Florence, Florence - Italy
Maria Teresa Molo, Carlo Molo Foundation Onlus, Turin – Italy
Discussant Chiara Simonelli, Sapienza University of Rome, Rome; EFS, European Federation of Sexology, Rome - Italy

Improving sexual health and wellbeing requires a holistic approach that takes into account the physical, mental, social and economic factors that all influence sexual behaviour. It is important that individuals have the information, knowledge, skills and accessible services that allow them to make healthy choices about the sexual lives. The Italian Federation of Scientific Sexology (FISS) promote this symposium to discuss the role of the Sexology in Italy and in Europe, after the recent first qualification exam for psycho-sexologists was held in Istanbul on January 28, 2014. The exam was arranged under the auspices of the European Federation of Sexology and the European Society of Sexual Medicine, addressed to psychologists of all nationalities, including countries outside the EU. After this update on the “state of the art” of the Sexology in Europe, the Symposium will take into account the relationships between personality organization, sexual dysfunctions and quality of sexual life. They will also discuss some of the issues of the couple sexuality through the comparison between heterosexual and homosexual couples in intimate relationship and the sexual life of the couple who live with an acquired brain disability. Participation of the President of the European Federation of Sexology as discussant will further analyze the various issues presented.

CLINICAL SEXOLOGY: “WHERE ARE WE GOING?”

Adele Fabrizi

During last years the promotion of education and training for sexologists became one of the most important topic in this scientific field. Concerning clinical aspects will be discussed the DSM-5 and its controversial issues about FSD and MSD. Finally we will discuss about what's new in sex therapy particularly regarding the Integrated Approach.

PERSONALITY ORGANIZATION, SEXUAL DYSFUNCTIONS AND QUALITY OF SEXUAL LIFE

Antonio Prunas

According to Otto Kernberg (2012), a specific relationship exists between the continuum of personality organization and the spectrum of sexual pathology.
Aim of the present study is to assess the relationship between the basic features of borderline personality organization, sexual dysfunctions and the quality of sexual life in a sample of adults from the community.

GAY AND LESBIAN COUPLES IN ITALY: COMPARISONS WITH HETEROSEXUAL COUPLES

Davide Dètore, Paolo Antonelli

The current study examined the psychometric properties of an Italian translation of the Marital Satisfaction Inventory – Revised (MSI-R), to assess the intimate relationships of gay and lesbian couples in Italy. The results were compared to data from heterosexual couples and to previously published data for gay, lesbian, and unmarried heterosexual couples from the United States.

A COUPLE AND AN ACQUIRED BRAIN DISABILITY

Maria Teresa Molo, Chiara Crespi

Whoever suffers from an acquired brain disability will never be the same as before. He/she needs the help of his/her spouse, whose autonomy becomes limited. The couple is trapped in the attachment/taking care system, instead of living an erotic sexualized relationship. They should find new meanings in the intimacy of the care, a deep emotional intimacy full of love.
In the field of psychology, there is a renewed interest for the concept of political ideology. Ideology can be studied as a network of acquired attitudes, values and beliefs depending on political discourse and history (top down processes) and as underlying psychological motives and needs that will affect how individuals take on ideological positions (bottom up processes). The aim of the symposium is to present how psychological aspects of political ideology may be universal or culture-specific. Political ideology has by default been operationalized as a unidimensional construct (liberal/leftist versus conservative/rightist) but can only to a certain extent illuminate the structure of political attitudes. Individuals may navigate along the left-right continuum to comprehend politics but be governed by psychological motives and needs which are more or less related to the right-left continuum. The most consistent differences in political attitudes concern, on the one hand, core beliefs concerning resistance to change or obversely acceptance of change and, on the other hand, attitudes toward equality versus inequality. The underlying psychological aspects regard epistemic motives to reduce uncertainty as well as existential motives to manage threatening circumstances. Situational factors such as threats (for example a financial crisis) may increase support for conservative opinions among individuals.

From a cross-cultural perspective, there is a heterogenity in self-identification of political ideology as individuals combine aspects of cultural (also labelled as social) and economic issues across the unidimensional construct. In the present European political debate, a generalized ideology of inequality has re-emerged where certain outgroups are considered to be unequal in value. Relying on personality, values and motivational approaches, this symposium investigates basic processes underlying political ideologies in European and US contexts.

**THE LEFT-RIGHT DIMENSION IN THE MINDS OF ICELANDIC VOTERS**

*Hulda Thorisdottir*

The talk reports a study of the left-right scale from 1987-2013 in a Western small-state democracy. Results show usage of the scale being remarkably stable over time, with no sign of sorting or polarization of the electorate having taken place. The contextual nature of the left-right in relation to specific political attitudes is examined.
PERSONALITY TRAITS, VALUES, ATTITUDES, AND MOTIVATIONS UNDERLYING POLITICAL IDEOLOGY IN SWEDEN AND ITALY: A COMPARISON OF THREE CONTEMPORARY MODELS
Gian Vittorio Caprara & Artur Nilsson
We tested three models of the underpinnings of political ideology, in Sweden and Italy, addressing: (1) political values, with underlying core values and traits, (2) right-wing authoritarianism and social dominance orientation, with underlying traits and worldviews, and (3) attitudes to change, equality, and the system, with underlying motivations.

VALUE PRIORITIES AND GROUP-FOCUSED ENMITY
Constanze Beierlein, Anabel Kuntz, & Eldad Davidov
Prejudice against outgroups (e.g., foreigners, Muslims, Jews or gays/lesbians) are often considered as an expression of group-focused enmity (GFE). Drawing on value research, we explore the motivational underpinnings of GFE in a German sample. We find that prejudice against different outgroups partly shares a similar motivational basis.

RIGHT-WING IDEOLOGY: THREAT AS A PSYCHOLOGICAL BASIS OF SOCIAL-CULTURAL AND ECONOMIC-HIERARCHICAL BELIEFS
Alain Van Hiel, Emma Onreat & Jasper Van Assche
Classic views suggest that threat underlies right-wing attitudes. In the present study a distinction is made between internal and external threat. We also present cross-national findings with respect to threat and right-wing attitudes.

GENERAL AND SPECIFIC DETERMINANTS OF POLITICAL IDEOLOGY IN AN OLD (SWEDEN) AND A NEW DEMOCRACY (LATVIA)
Maria Sandgren, Girts Dimdins, & Henry Montgomery
Our findings support a two dimensional (acceptance vs. avoidance of uncertainty, high vs. low toughmindedness) model of political ideology in Sweden and Latvia. A closer examination reveals that cultural differences concern party structure, ethnic identification, social, and economic attitudes.
IS021
PROVIDING PSYCHOLOGY SUPPORT IN AN ELITE SPORT ENVIRONMENT

E10 - Health and clinical intervention - Sport and exercise

Convenor Paul Wylleman, Vrije Universiteit Brussel, Brussels - Belgium
Presenters Alberto Cei, Tor Vergata University, Rome - Italy
Anne-Marie Elbe, University of Copenhagen, Copenhagen - Denmark
Nadine Debois , Institut National du Sport, de l’Expertise et de la Performance, Paris - France
Paul Wylleman, Vrije Universiteit Brussel, Brussels - Belgium
Ralf Brand, University of Potsdam, Potsdam – Germany
Discussant Anne-Marie Elbe, University of Copenhagen, Copenhagen - Denmark

As the field of sport psychology is witnessing a growth in interest in professional practice in Europe, it is also faced with the challenge of developing its professional status. This symposium aims therefore at presenting not only research but also experiential knowledge regarding the development and provision of professional applied sport psychology services at the elite and Olympic level. In particular, attention will be focussed on the actual process of consulting with and support provision of elite athletes as well as on aspects related to being an elite and Olympic athlete including coping with anti-doping procedures and the dual career of elite athletes. This symposium, organised by the European Federation of Sport Psychology (FEPSAC), brings in this way experts together from five European countries.

CAN YOU HELP ME WITH THAT? AN INTEGRATED VIEW ON ELITE ATHLETES’ CONSULTATION ISSUES
Ralf Brand, Ole Benthien & Mascha Grote
Since 2011 the University of Potsdam’s Center of Practical Sport Psychology delivered psychological support to around 350 adolescent and adult national team athletes. We will describe this center’s service structure and paint an empirical picture about the most frequent consultation issues by content-analyzing more than 1700 consultation protocols.

SHOOTING ATTENTIONAL TRAINING
Alberto Cei
Shooting is a sport very challenging the mind power, requesting to stay confident and focused also during the more stressful moments of the competition. This presentation will describe the development of an efficient attentional training to cope with performing at their best in all shots.

DUAL CAREER IN FRENCH ELITE SPORT
Nadine Debois & Aurélie Ledon
Dual career support in elite sport may be based on each athlete’s desired vocational future rather than on a default choice for an educative program easily reconcilable with the sport career. We will present results from recent studies on that topic as well as the French career assistance organization system designed in that perspective.
REDUCING THE NEGATIVE IMPACT OF ANTI-DOPING REGULATIONS ON ATHLETES’ PSYCHOLOGICAL WELL-BEING: THE ROLE OF THE SPORT PSYCHOLOGIST
Anne-Marie Elbe & Marie Overbye
Anti-doping regulations like urine doping testing and the obligation to report whereabouts can negatively impact elite athletes’ psychological well-being. We will present the results of recent studies investigating this impact and discuss how sport psychologists can support elite athletes to better deal with these anti-doping measures.

THE ORGANISATION AND PROVISION OF PERFORMANCE BEHAVIOUR SUPPORT TO DUTCH OLYMPIC ATHLETES
Paul Wylleman & Maurits Hendriks
This presentation will focus on specific aspects of the provision by the Dutch Olympic Committee NOC*NSF of performance behaviour support to its elite and Olympic athletes and coaches including support providers’ competency profiles, integration in interdisciplinary teams, continued professional development, and quality of service delivery.
IS022
ATTACHMENT AND EMOTION REGULATION ACROSS THE LIFE-SPAN: NEUROBIOLOGICAL, DEVELOPMENTAL AND CLINICAL PERSPECTIVES

B04. Development and Education - Attachment and intimate relationships

Convenor: Marinus H. Van IJzendoorn, Leiden University, Leiden - Netherlands
Presenters: Lieselotte Ahnert, University of Vienna, Vienna - Austria
Marjan J. Bakermans-Kranenburg, Leiden University, Leiden - Netherlands
Marinus H. van IJzendoorn, Leiden University, Leiden - Netherlands
Morten L. Kringelbach, Universities of Oxford, Oxford; Aarhus University, Aarhus - United Kingdom
Pier Francesco Ferrari, University of Parma, Parma - Italy
Discussant: Lavinia Barone, University of Pavia, Pavia - Italy

Attachment is a concept used in a variety of disciplines such as biology, psychiatry, child and family studies, social and clinical psychology. Attachment has been studied in various species and at all levels of development, from the prenatal period to old age. In this invited symposium we want to address some recent advances in neurobiological research on attachment and emotion regulation to see how attachment supports human adaptation to various niches and social challenges. The role of two hormones central to the study of attachment across the life-span will be discussed, namely oxytocin and cortisol. Oxytocin would prepare for parenting and bonding, whereas cortisol has been related to stress and emotion regulation. On the neural level new insights into the role of the orbitofrontal cortex in parenting will be presented, as the OFC seems engaged in several phases of parent–infant interactions, from early, privileged orienting to infant cues, to ongoing monitoring of interactions and subsequent learning. Furthermore, evidence on the critical role of the mirror neuron system in developing attachments will be discussed. Electroencephalografic findings in newborn macaques showed that a mirror mechanism operates in the early stages of postnatal development and that early adverse social experiences affect its developmental trajectory. The presentations aim to offer new insights into the interactions between hormones, brain neural activity, and attachment.

IS OXYTOCIN AN ATTACHMENT HORMONE?
Marinus H. van IJzendoorn & Marian J. Bakermans-Kranenburg
Oxytocin is widely advertised as the ‘love hormone’ promoting attachment relationships between adults and between parents and their children. The effects of oxytocin, however, seem dependent on childhood attachment experiences, and may not always be positive. Its potential use in (therapeutic) interventions will be discussed.

EXPLORING THE HUMAN PARENTAL BRAIN
Morten L. Kringelbach
The parent-infant relationship is fundamental to infant survival and development, and the bond appears to form effortlessly and intuitively. I will examine emerging evidence that the orbitofrontal cortex is engaged in several phases of parent–infant interactions, from early, privileged orienting to infant cues, to ongoing monitoring of interactions and subsequent learning.
FATHER-CHILD ATTACHMENT AS RELATED TO FRUSTRATION TOLERANCE AND STRESS REACTIVITY IN PRETERM AND FULL TERM BABIES
Lieselotte Ahnert, Bernard Piskernik, Barbara Supper, Andrea Witting & Nina Hammer
Because fathers challenge children from early on, they might also influence child stress reactivity. Thus, we collected data on saliva cortisol, frustration tolerance and attachments in pre and full term babies. In preterms, stress reactivity and frustration tolerance appeared constricted, for which father-child attachment was the only predictor.

EARLY SOCIAL EXPERIENCES AND THE DEVELOPMENT OF MIRROR NEURONS IN MONKEYS
Pier Francesco Ferrari
Mirror neurons have been proposed to play a central role in social relations. In a series of studies in monkeys and humans we have investigated the issue of how mirror neurons (MN) emerge during development and which social experiences could be critical for their formation. These studies provide an original account of basic aspects of social cognition, and offer new insights on the interactions between brain plasticity and early experience.
IS023
USING TECHNOLOGY TO ENCOURAGE ENVIRONMENTAL BEHAVIOR

F11. EXPO 2015 Hot Topics - Environment and sustainability

Convenor Wesley Schultz, California State University, San Marcos - United States
Presenters Andreas Nilsson, University of Gothenburg, Gothenburg - Sweden
Cees Midden, Eindhoven University of Technology, Eindhoven - Netherlands
Ruth Rettie, Kingston Business School, Kingston Hill - United Kingdom
Stefano De Dominicis, Sapienza University of Rome, Rome – Italy

This invited symposium focuses on the ways in which technology can be used to promote proenvironmental behavior. Especially in the area of electricity consumption, technology serves a critical role in encouraging individuals to use less, and to use energy more efficiently. Recent advances in hardware and software have provided new platforms with which to present persuasive communications. This symposium brings together experts from four countries, with each presenting new empirical research findings in which they use technology to change behavior. All four of the presentations focus on electricity consumption, and leverage insights from psychological science to promote reductions in consumption.

USING AMBIENT PERSUASIVE LIGHTING TO ENCOURAGE ENERGY SAVING
Cees Midden

ENERGY FEEDBACK IN THE HOME: DISSONANCE AND DENIAL
Ruth Rettie, Tim Harries and Kevin Burchell
This paper describes three experiments that used digital technology platforms to promote proenvironmental behavior. The studies suggest that people are reluctant to apply a cognitive frame of material economy to a space that, for many, is essentially social and emotional: the home.

MINDING THE GAP: NORMATIVE INFLUENCE ON ENERGY CONSERVATION INTENTIONS
Magnus Bergquist and Andreas Nilsson
The study examine the gap between an induced norm and behavior (norm distance), applied to energy behaviors. Results show that congruent descriptive and injunctive norms produce more conformity and stronger motivation compared to incongruent descriptive and injunctive norms. In the congruent norm condition more distal norms yield greater influence. The ambiguous unity (kWh) produce higher motivation compared to the dis-ambiguous unity (SEK).

USING NORMATIVE FEEDBACK TO REDUCE ENERGY CONSUMPTION
Stefano De Dominicis
In a field study involving 431 households in San Diego County and aimed at reducing electricity consumption, we provided residents with different real time feedbacks via ad-hoc designed in-home displays. Results show that the impact of a motivational element such as social-norm is the most effective to reduce households’ electricity consumption.
IS024
ADVANCES IN SOCIO-ECOLOGICAL PSYCHOLOGY: HOW DO PSYCHOLOGICAL VARIABLES INTERACT WITH OBJECTIVE FEATURES OF PLACES, CITIES, AND REGIONS IN THE PROCESS OF PSYCHOLOGICAL ADAPTATION?

A19. General issues and basic processes - Other

Convenors  Martin Obschonka, Saarland University, Saarbruecken - Germany
Rainer K. Silbereisen, Friedrich Schiller University of Jena, Jena - Germany

Presenters  Clemens Lechner, Friedrich Schiller University of Jena, Jena - Germany
Ingrid Schoon, University of London, London - United Kingdom
Peter Jason Rentfrow, University of Cambridge, Cambridge - United Kingdom
Ulrich Trautwein, University of Tübingen, Tübingen – Germany

Recent advances in socio-ecological psychology have spurred a debate whether psychological science should retain its deeply intrapsychic and subjectivist focus. Socio-ecological psychology (Oishi, 2014), a relatively young field of investigation that however is based on classical theories that view psychology as intimately intertwined with the context (e.g., Bronfenbrenner, 1979; Lewin, 1939), attempts to bring the objective perspective to psychological science by investigating how objective social and physical features of the broader environment (e.g., city or region) affect psychological mechanisms at the individual and group level, and vice versa. Inspired by this objectivist-contextual perspective, the proposed Invited Symposium deals with the question whether objective features of the broader environment moderate psychological mechanisms at the individual level. The aim is to present cutting-edge research from different sub-disciplines of psychology (e.g., personality psychology, developmental psychology, social psychology, clinical psychology) that apply a socio-ecological perspective in these fields. The presentations will investigate an individual-level psychological independent variable referring to a general or concrete concern of the individual (e.g., perceptions of social change, economic recessions or natural disasters; salient developmental tasks etc.), an individual-level psychological dependent variable referring to psychosocial adaptation (e.g., psychological well-being), and objective features of the broader environment (e.g., neighborhoods, cities, and regions) as a moderator variable. The symposium will contribute to the growing body of evidence illustrating how psychological variables interact with the objective social ecology in the process of psychological adaptation.

GEOGRAPHICALLY VARYING ASSOCIATIONS BETWEEN PERSONALITY AND LIFE SATISFACTION IN THE LONDON METROPOLITAN AREA

Markus Jokela, Peter J. Rentfrow, Wiebke Bleidorn, Michael E. Lamb, Samuel D. Gosling

We examined how life satisfaction and personality traits are geographically distributed within the U.K. London metropolitan area (n=56,019), and how the strength of associations between personality traits and life satisfaction vary by residential location (i.e., personality–neighborhood interactions). Residential area was recorded at the level of postal districts. The strength of associations between personality traits and life satisfaction were dependent on neighborhood characteristics. Higher openness to experience was more positively associated with life satisfaction in postal districts with higher average openness to experience, population density and ethnic diversity. Higher agreeableness and conscientiousness were more strongly associated with life satisfaction in postal districts with lower overall levels of life satisfaction. The associations of extraversion and emotional stability were
not modified by neighborhood characteristics. These findings suggest that people’s life satisfaction depends, at least in part, on the interaction between individual personality and particular features of the places they live.

THE CLASSROOM CONTEXT: DIRECT AND MODERATION EFFECTS ON EMOTIONAL WELL-BEING FOR VULNERABLE STUDENTS
Ulrich Trautwein & Richard Göllner, University of Tübingen
For the past 30 years, research has shown that emotional stability has a strong association to psychosocial well-being and plays a key role in accounting for the severity and maintenance of emotional problems. This applies to adults, children, and adolescents. Youths low in emotional stability tend to encounter peer rejection and exhibit negative emotions, such as fear, sadness, anxiety, or depression. In the present study, we tested the classroom context of students as a differential risk factor for peer adversity among emotionally unstable students. Participants included 2,895 5th graders from 130 classrooms in a large-scale longitudinal study (TRAIN, Tradition and Innovation) in Germany as well as their parents and teachers. The results of multilevel-regression analysis supported a Person × Environment model in which emotionally unstable students experienced more peer adversity and reported a lower level of emotional well-being when their classrooms are high in disruption and disorganization. The findings provide further insights about the influence of extrafamilial environments on the social and emotional adjustment of students in general and, in particular, of emotionally unstable students.

FAMILY SOCIO-ECONOMIC ADVERSITY AND YOUNG PEOPLE’S TRANSITION INTO THE LABOUR MARKET. THE ROLE OF AREA DEPRIVATION AS POTENTIAL MODERATOR
Ingrid Schoon and Nicola Pensiero, Institute of Education, University of London, UK
The existing literature suggests that growing up in a family experiencing socio-economic adversity and financial hardship can have adverse long-term effects regarding educational and occupational attainment. Moreover, previous research suggests that where one lives matters in terms of life opportunities. Living in a disadvantaged neighbourhood, especially in urban areas, has been associated with lower levels of educational performance and problems in making the transition to paid employment. In this paper we assess the role of area deprivation as a potential moderator, taking into account multiple dimensions of parental socio-economic adversity, the level of educational achievement orientation and associated experiences in the labour market transition. Our analytic sample comprises 9,874 young people participating in the Longitudinal Study of Young People in England (LSYPE), a cohort of young people born in 1989/90. Area deprivation is indicated by the Index of Multiple Deprivation (IMD); parental socio-economic adversity comprises measures of parental education, employment, financial hardship, family structure and housing conditions; education achievement orientation comprises indicators of educational aspirations and expectations; and problems in employment transitions is measured through information in young people's activity status between ages 16 to 20 years, in particular the total number of months not being in education, employment or training (NEET). We also control for variation by gender and ethnic minority status. The findings suggest that area characteristics affect the association between parental hardship and labour market transitions of their offspring, pointing to a moderating role of local opportunities in shaping employment transitions among disadvantaged young people.

WHO REAPS THE BENEFITS OF SOCIAL CHANGE? AGENTIC PERSONALITY AND ITS SOCIO-ECOLOGICAL BOUNDARIES
Clemens Lechner, Martin Obschonka & Rainer K. Silbereisen, University of Jena, Germany
Modernity offers a host of new opportunities for personal growth and flourishing. Among the most widely discussed trends are (1) individualization, entailing broadening lifestyle choice on the side of the individual; and (2) the trend towards lifelong learning, offering new opportunities the acquisition
of knowledge and competencies, often through new technologies. Not all individuals benefit from this “positive side” of social change to the same extent, however. In the present study, we investigated the role of agentic personality as a source of individual differences in the exposure to the benefits of individualization and lifelong learning. We hypothesized, first, that people with a more agentic personality actively seek out and embrace the new opportunities, resulting in a higher subjective experience of broadening lifestyle choice and new learning opportunities. Second, we assumed that the effect of agentic personality is bounded by the social ecology, with stronger associations between agentic personality emerging in social ecologies that are facilitative of agentic exploration. Specifically, we predicted that the agentic personality predicts experiences of broadening lifestyle choice especially in regions with a higher divorce rate, and experiences of new learning opportunities especially in regions with a high internet adoption rate. Analyses in two parallel samples from Germany (N = 2,442) and Poland (N = 2,571) largely confirmed these predictions. Combining subjective indicators changes in personal life circumstances with objective socio-ecological data, our study thus demonstrates that agentic personality plays an important role in “reaping” the potential benefits that social change holds – but that the effect of agentic personality is bounded by the opportunities and constraints in the social ecology.
IS025
EUROPEAN CITIZENSHIP TODAY: WHAT DOES IT MEAN?

C6 – Culture and society - Attitudes and values

Convenor: Bruna Zani, Alma Mater Studiorum - University of Bologna, Bologna - Italy
Presenters: Bruna Zani, Alma Mater Studiorum - University of Bologna, Bologna - Italy
Dimitra Pachi, BPP University, London - United Kingdom
Elena Marta, Catholic University of Milan, Milan - Italy
Zuzana Scott, Masaryk University, Brno - Czech Republic

Discussant: Serdar M. Değirmencioğlu, Dogus University, Istanbul - Turkey

The aim of the symposium is to discuss the meaning of European citizenship today, focusing on a series of questions around this theme, like the nexus between EU citizenship and identity, the relationship between national and European citizenship, national and European identity, right and duties of European citizens, the minorities non-citizens. Four papers will be presented by authors coming from three different EU states (UK, Italy and Czech Republic), discussing some psychological and psychosocial variables in influencing the construction and development of EU citizenship among young people, and in particular the role of ethnicity (Dimitra Pachi), the new forms of engagement adopted by young people to have their voice heard (Bruna Zani, Cinzia Albanesi, Elvira Cicognani); identification (sense of importance and pride) with Europe and country of origin, and the trust in European and national institutions (Zuzana Scott, Jan Serek, & Petr Macek); the components of European identity and representations (Elena Marta, Daniela Marzana, Sara Alfieri). The implications of all these problems at the policy level will also be discussed.

PERCEPTIONS OF CITIZENSHIP AMONGST YOUTH IN LONDON; DOES ETHNICITY MATTER?
Dimitra Pachi

This talk is going to be on: a. the meaning of citizenship for ethnic majority and minority young people and b. young people’s perceptions of and attitudes towards, in particular, EU citizenship (how much they know about it, whether they hold on to it and what role it plays for them). The results of the PIDOP (Processes Influencing Democratic Ownership and Participation) project showed that ethnicity plays an important role as it differentiates both perception of citizenship and levels of European identification, with challenging implications at a policy level.

BECOMING EUROPEAN ACTIVE CITIZENS
Bruna Zani, Cinzia Albanesi & Elvira Cicognani,

The paper will discuss some preliminary data on the concept of active citizenships, in a sample of Italian young people, with particular attention to the new forms of participation and engagement youngsters adopt to have their voice heard at national and European levels. Findings from focus groups will be presented, illustrating their perspective on Europe, their role in constructing a “new” European vision, their requests to the policy makers.

PROUD TO BE EUROPEAN?
Zuzana Scott, Jan Serek, & Petr Macek
For many young people, being European is more of an abstract category rather than expression of strong sense of common identity. However, this does not mean that young people are unaware of their belonging to Europe and their Europeanism. In this presentation we examine young people's identification (sense of importance and pride) with Europe (EU) and country of origin, their trust in European Union/national institutions, and participatory roles of young people, national government, and European Union as perceived by youth from Czech Republic.

YOUNG ITALIANS AND THE EUROPEAN CITIZENSHIP: PERCEPTIONS, REPRESENTATIONS, AND IDENTITY
Elena Marta, Daniela Marzana & Sara Alfieri
Within the Youth Report promoted by the Milan Toniolo Institute, attention is also brought onto the subject of Europe and the European citizenship. A national sample of 1750 young people completed a questionnaire aimed at investigating perceptions about Italian citizenship and European citizenship; the components of the European identity; the representations of Europe; meaningful figures in the definition of citizenship and of European identity.
IS026
PRIMARY CARE PSYCHOLOGY - LATEST DEVELOPMENTS IN INTEGRATED CARE: AN INTERNATIONAL PERSPECTIVE

E08. Health and clinical intervention - Community Psychological Care

Convenor Robyn Vines, University of Western Sydney, Bathurst - Australia
Presenters Bente Storm Mowatt Haugland, Uni Research, Bergen - Norway
Diana L. Prescott, Hampden Psychological Consultation, PLLC, Hampden - United States
James Bray, Baylor College of Medicine, Houston - United States
Jean Grenier, University of Ottawa, Ottawa - Canada
Marie Helene Chomienne, University of Ottawa, Ottawa - Canada
Robyn Vines, University of Western Sydney, Bathurst - Australia
Discussant Robyn Vines, University of Western Sydney, Bathurst - Australia

This symposium will provide an overview of current progress in integrated psychological service delivery in the primary care setting in a number of western countries. Primary Care Psychology is a growing area of practice and service delivery, at the core of which lies a collaborative model of mental and general health care involving appropriately trained psychologists working with family physicians in the general practice setting. Its key objective is to provide early intervention for common mental health disorders (previously under-treated), chronic disease and its behavioural and mental health sequellae. The model minimizes the stigma of help-seeking, facilitates more equitable access to care, and requires different approaches to those traditionally used in the hospital, community health and private practice sectors. Research indicates that many major health problems, such as diabetes, heart disease and obesity, are due to psychosocial and lifestyle issues and are frequently sub-optimally treated by the medical profession alone. Similarly, mental health care in many places still results in high prevalence/common mental disorders such as depression and anxiety being treated by drug therapy alone and/or generic counselling delivered by a number of different service providers. In addition, low prevalence conditions such as schizophrenia are still largely referred to psychiatrists for pharmacological treatment alone. Appropriately trained psychologists have much to contribute to the optimal treatment of these disorders and are becoming increasingly involved in the earlier intervention and prevention of these problems in a new integrated health care framework.

The symposium will provide an overview and comparison of integrated models of primary care service delivery in six western countries: Norway, the USA, Canada, Australia, the United Kingdom and France. In each of these, current research & service delivery trials, funding mechanisms and training models will be explored, as well as current barriers to optimal roll-out of these psychological services. The focus will be on best practice models and evidence-based interventions for treatment and training, and will provide an up-date on current progress in different countries with a view to establishing better networks to support this work internationally.

PRIMARY CARE PSYCHOLOGY IN THE UNITED STATES: COMMON BEHAVIORAL HEALTH AND SUBSTANCE USE PROBLEMS
James Bray
This presentation will discuss the status of psychologists in the USA who work in primary care settings and its relationship to the health care reforms that are occurring; practice opportunities in primary care in private and public settings; and the use of technology and electronic health records in
primary care practice.

**WOW! WAY TO OPTIMAL WEIGHT: INTEGRATED CARE FOR CHILDREN AND ADOLESCENTS IDENTIFIED WITH UNHEALTHY WEIGHT IN THE RURAL UNITED STATES**  
*Diana L. Prescott*

*WOW!* is a pediatric obesity program offered to children and adolescents with a BMI greater than the 85th percentile. Staff involved in this integrated programme include a paediatrician, certified personal trainer, nurse, registered dietician, clinical psychologist and students from each specialty. The program allows integrated care for patients and their families and access to all team members each visit.

**PRIMARY CARE PREVENTION OF ANXIETY PROBLEMS IN NORWEGIAN JUNIOR HIGH SCHOOL ADOLESCENTS**  
*Bente Storm Mowatt Haugland*

Anxiety is a major mental health problem among adolescents, but the majority of anxious youth do not receive effective help. By training and supervising school-health nurses in delivering cognitive behavioural therapy (CBT), improved access to effective help within the primary health care system is provided. The comparative effectiveness of this intervention will be discussed.

**PRIMARY CARE PSYCHOLOGY IN AUSTRALIA**  
*Robyn Vines*

Medicare funding was made available for psychological service delivery in Australia in 2006. Since then, a number of models of care have operated. A best practice training model for psychologists to work collaboratively with GPs in the provision of primary mental and general health care services has been developed in Australia. The history and outcomes of this Integrated Care Model will be presented.

**OPENING ACCESS TO PSYCHOTHERAPY IN CANADA: AN UPDATE**  
*Marie Helene Chomienne*

In the wake of its primary care reform, Canada is now focusing on improving mental health care with strategies such as “Every door is the right door” in Ontario. In Quebec a group is working to improve access to psychotherapies. This presentation will provide an update on the status of primary mental health care in Canada.

**MANAGEMENT OF CHRONIC INSOMNIA IN THE PRIMARY CARE SETTING**  
*Jean Grenier*

Cognitive behavioral therapy (CBT) is the recommended treatment for management of chronic insomnia (CI) in guidelines from Canada, USA, UK. CBT is also effective when CI co-exists with anxiety, depression, and chronic physical diseases. This presentation will outline how to recognize and treat CI in adults, in the primary care setting.
TEMAS TEST AS ASSESSMENT AND TREATMENT TECHNIQUES FOR CULTURALLY DIVERSE CHILDREN

E03. Health and clinical intervention - Personality assessment
E05. Health and clinical intervention - Evidence-based psychotherapies

Convenor: Patrizia Bevilacqua, Catholic University of Milan, Milan - Italy
Presenters: Dionne Joseph, Psychologist, Doha - Qatar
Erminia Costantino on behalf of Giuseppe Costantino, American Multicultural Institute, New York - United States
Filippo Aschieri, Catholic University of Milan, Milan - Italy
Francesca Fantini, Catholic University of Milan, Milan - Italy
Larry McReynolds, Lutheran Medical Center/Lutheran Family Health Centers, New York - United States
Leib Litman, Touro College & University System, New York - United States

TEMAS has been used as a multicultural test and as an evidence-based Narrative therapy TEMAS (TNT). In The USA, TEMAS was standardized on 650 youngsters aged 5 to 13 and normed on four culturally diverse groups: Black, Puerto Rican, Other Hispanic, and White. There are two parallel versions: minority and nonminority and two forms: the long form has 23 cards, and the short form of 9 cards, the latter is used clinically. The test assesses cognitive, affective and personality functions and is scored objectively. As an evidence-based therapy, TEMAS was first used with Hispanic children in 1994 and showed to be effective in reducing anxiety and aggressive behavior. It was also successfully used as trauma treatment with Hispanic children in the 9/11 terrorist attacks multisite study. At the present it is being used in a large school-based trauma project. The objective of this symposium is to show that the TEMAS is a valid multicultural assessment instrument and as an evidence-based trauma therapy.

STANDARDIZATION OF THE ITALIAN TEMAS
Francesca Fantini, Filippo Aschieri and Patrizia Bevilacqua.

The Italian TEMAS Standardization was conducted on a group of 297 children (153 females and 144 males) aged between 6 and 10 years, with an average age of 8.33 years (SD = 1.35). The children were divided into three ethnic groups: Italian (Italian-born children from families of Italian origin), American-Hispanic (origin of Ecuadorian and Peruvian children born in their country or in Italy) and Arabic (Egyptian and Moroccan children born in their country or in Italy). Evaluation of the concurrent validity and interrater reliability showed that the TEMAS is a reliable and valid test to be used with such cultural groups in Italy.

THE CHINESE VERSION OF THE TEMAS: A FIRST EXPLORATION WITH CHINESE CHILDREN IN ITALY
Francesca Fantini, Filippo Aschieri and Maria Luisa Gennari

The Chinese TEMAS, whose pictures were designed to Chinese Characters and setting in China, was tested on 45 Chinese children aged 8 to 12 children while parents completed measures of acculturation strategies and they were interviewed on their parenting strategies. Analyses revealed that children’s TEMAS stories were positively related to acculturation strategies as a moderator variable, and to the parenting strategies reflected in the interviews.

CLINICAL UTILITY OF TEMAS WITH A SOUTH AFRICAN GIRL
**Dionne Joseph**

The TEMAS was used in the assessment of an 8-year-old girl of South African, Zulu origin, residing with her father and stepmother in Doha, Qatar. This child had a history of eating disorder/obesity, suspected sexual abuse and disordered family attachments in South Africa. The TEMAS successfully ‘pulled’ for these issues, some of which were corroborated by the child’s father, some of which were only revealed during the assessment. The TEMAS was particularly useful given that the child was very reluctant to engage in more direct methods of eliciting information about her history and internal psychological processes.

**TEMAS NARRATIVE THERAPY WITH HISPANIC CHILDREN AFFECTED BY TRAUMATIC STRESS**

*Giuseppe Costantino, Leib Litman and Larry McReynolds*

TEMAS Narrative Therapy is used in a large grant project to reduce traumatic stress among school-based children; 350 children received 14 sessions of TEMAS Therapy while 350 and 350 children received 14 sessions of Cuento (Storytelling) Therapy. Preliminary results indicate that the TEMAS Narrative Trauma Therapy seems to be an effective evidence based therapy with these minority children.

**THE LIFE AND WORK OF GIUSEPPE COSTANTINO/PRESENTAZIONE IN MEMORIA DI GIUSEPPE COSTANTINO**

Giuseppe Costantino, Ph.D. (1937-2015) was a trilingual child international psychologist, fluent in English, Spanish and Italian. He was a writer, researcher, clinician, professor, mentor, friend, husband and father. Throughout his career he made significant contributions to multicultural assessment; Dr. Costantino was the author of the only validated story telling assessment/narrative multicultural test, TEMAS (Tell-Me-A-Story), which has been translated into 9 languages, CuentoTherapy, and TEMAS Narrative Therapy.

At the time of his death, he was the Director of Research, at Lutheran Family Health Center Network, NYC; Professor at the Graduate School of Psychology, Touro College. His TEMAS has been the topic of dissertations, globally. He presented and trained around the world. He had extensive experience in providing clinical services, and conducting research programs with traumatized groups, especially Latino children and families, in the United States and abroad. Colleagues, friends and family will discuss his contributions to the world.
IS028
INTERPERSONAL FACTORS RELATED TO BURNOUT: NEW DEVELOPMENTS IN SERVICE PROFESSIONS

Contemporary workers are exposed to increasing and demanding interactions with other people, mainly due to the impressive growth of service-related jobs, and to the rising number of team-based organizations in which people are supposed to work interdependently and collaborate with each other to achieve common work goals. It is well-known that interpersonal stressors (such as conflicts and requests by clients and colleagues) contribute to the most relevant chronic stress syndrome, namely burnout, whereas its interpersonal repercussions are underexplored. The first aim of this symposium is to present some contributions that focus on interpersonal factors that may have a role as antecedents as well as consequences of burnout among different professions (health care providers, call centre operators, civil servants) and countries (Canada and Italy). In doing so, a particular emphasis will be given to new concepts and current phenomena (i.e., civility/incivility, interpersonal strain at work, workplace bullying), sophisticated methodologies (i.e. longitudinal and diary studies) taking into consideration self-reported and organizational data (i.e. customer satisfaction). Finally, the impact of positive or negative individual characteristics (i.e. self-efficacy and negative affectivity) in the strain process will be also examined.

PERSON AND DAILY LEVELS OF LINKS OF BURNOUT WITH WORKPLACE CIVILITY

Michael P. Leiter, Emily Peck, Vicki Magley, Jenna Shapiro, Howard Tennet
A diary study of health care providers tested a model of relationships among exhaustion, cynicism, and civility on a person level (between subjects) and a daily level (within subjects). A hierarchical model confirmed that a model with exhaustion predicting cynicism and civility (with an additional path from cynicism to civility) fits both levels.

THE PROTECTIVE ROLE OF OCCUPATIONAL SELF EFFICACY ON NURSES EXPERIENCES OF WORKPLACE INCIVILITY AND BURNOUT

Heather Laschinger, Roberta Fida
Exposure to workplace incivility results in burnout and in less job satisfaction and health and intention to leave. Our results showed that nurses who believed they had the ability to cope with occupational demands perceived lower incivility, experienced less burnout and were more satisfied with their job and in general felt better.

INTERPERSONAL STRAIN AMONG SERVICE PROFESSIONALS: A NEW BURNOUT FACET AND ITS ORGANIZATIONAL IMPACT

Chiara Consiglio, Laura Borgogni, Guido Alessandri
Interpersonal strain represents the detach and disengaged reaction toward relationships at work (clients, colleagues and supervisor) that has been recently related to burnout. This study, conducted in the call centre setting, explored the mediating role of interpersonal strain in the relationship between self-efficacy and customer satisfaction.

WORKPLACE BULLYING AND PSYCHOLOGICAL DISTRESS: A THREE-YEAR FOLLOW-UP STUDY AMONG UNIVERSITY EMPLOYEES.

Cristian Balducci, Franco Fraccaroli

We examined longitudinally the impact of workplace bullying on psychological distress among employees of an Italian University undergoing a major organizational restructuring. We also examined reversed and reciprocal causation between the two variables and controlled for negative affectivity, a potential confounder of the examined relationships.
IS029
EARLY ADVERSITIES, TRAUMA AND DEVELOPMENTAL PSYCHOPATHOLOGY: RECENT CLINICAL DEVELOPMENTS AND TREATMENT PERSPECTIVES

Recent studies have revealed the long-term consequences of early adversities and childhood traumatic events that increase vulnerability to mental health disorders in late adolescence and adulthood. There is a wealth of evidence demonstrating not only the long term persistence of PTSD and other psychological disorders following traumatic events, but also how early adversities may produce structural and functional brain imaging changes, neuroendocrine and immune alterations. In the last few years, moreover, studies highlighted the role of gene-environment (GxE) interaction in the etiology of posttraumatic disorders and PTSD.

In this symposium we want to advance our understanding on the developmental course of early adversities from childhood to adolescence and adulthood, and to examine how it is related to psychological and biological risk factors. The invited speakers will therefore offer an update on child trauma, from the standpoint of genetics, neurobiology, psychology, and psychotherapy according to a developmental psychopathology approach.

A better knowledge of long term consequences of different types of child trauma (from child abuse to natural disasters), as well as of the neurobiological and psychological basis for individual vulnerability and resilience, can help improving primary prevention and pave the way towards individually-tailored therapies.

PREVALENCE AND RISK FACTORS OF CHRONIC POST-TRAUMATIC STRESS DISORDER IN CHILDREN AND ADOLESCENTS AFTER THE 2012 EARTHQUAKE AFFECTING THE MODENA PROVINCE: PRELIMINARY RESULTS OF A CROSS-SECTIONAL STUDY

Barbara Forresi, Ernesto Caffo, Francesco Soncini, Emanuele Bottosso, Elena Righi, Omar Daolio, Ilenia Maini, Elena Di Pietro, Gabriella Aggazzotti

The aim of this study was to investigate the prevalence of chronic PTSD in children and adolescents after the 2012 Emilia Romagna Earthquake, and to identify PTSD potentially related individual and social risks and protective factors to be addressed in future effective preventive interventions.

GRIN2B PREDICTS ATTENTION PROBLEMS AMONG DISADVANTAGED CHILDREN

Marco Battaglia

The interacting effect of GRIN2B variants with 4 measures of adversities [low socioeconomic status (SES), preterm delivery, maternal smoking during pregnancy, and absence of breastfeeding] was
investigated upon blindly assessed cognitive abilities (vocabulary, block design, digit spans of Wechsler's Intelligence Scale, and Rey complex figure) and parents-rated behavioral problem.

**EVIDENCE-BASED TREATMENTS HELP TRAUMATIZED CHILDREN: OUTCOMES OF TRAUMA-FOCUSED COGNITIVE-BEHAVIORAL THERAPY FOR CHILDREN**

*Judith Cohen*

The Author will present recent studies on the outcomes of the TF-CBT for children and adolescents.

**THE DEVELOPMENT OF PERCEIVED MATERNAL AND PATERNAL HOSTILE, AGGRESSIVE CONFLICT FROM ADOLESCENCE TO EARLY ADULTHOOD AND THEIR RELATIONS WITH POST TRAUMATIC STRESS DISORDER SYMPTOMS.**

*Valeria Castellani, Concetta Pastorelli, Eriona Thartori, Ernesto Caffo, Barbara Forresi, Maria Gerbino*

Using multiple waves of data from the Genzano (Rome) Longitudinal project, this study examined the development of mother and father-adolescent hostile aggressive conflict from late adolescence to young adulthood. The role of previous child' problems and family characteristics, as well as the relation of level and change in mother and father-adolescent hostile aggressive conflict to adolescents' post traumatic stress disorder symptoms will be investigated.
The “Demise of Guys”—DoGs (Zimbardo & Duncan, 2012) describes a troubling pattern of emotional and behavioral expression by young men characterized by diminished educational, psychosocial, and career development. The first presentation focuses on two main symptoms of this demise: excessive and socially isolated video game playing and Internet porn use and concludes by offering practical suggestions for parents, teachers, and guys themselves about how they can balance their lives and environment in order to thrive. To address the lack of social skills associated with the DoGs, the second presentation reviews a 30-year program designed to promote basic social communication skills and concludes with a description of a program and manual created to help psychologists and trainers improve clients’ basic social skills. The third presentation describes the implementation of an intervention strategy using “START Everyday Heroes” wristbands to increased social engagement by young males and concludes with suggestions for incorporating these inexpensive wristbands into multiple intervention pathways by parents, clinicians, and educators to address the DoGs. To promote enhanced social connectedness, the fourth presentation describes a five-step format for helping individuals develop conversational skills based on an understanding of the basic elements within the structural anatomy of conversation and concludes with suggestions for creating opportunities to practice conversational skills in a variety of day-to-day situations.

WHERE HAVE ALL THE GUYS GONE?: SAVING THE NEXT GENERATION FROM ISOLATED EXISTENCES
Philip G. Zimbardo
To help account for the “Demise of Guys,” this presentation will focus on two main symptoms of this demise: excessive and socially isolated video game playing and Internet porn use. This presentation will also discuss some of the potential causes, including changing family dynamics, media influences, environmentally generated physiological changes that decrease testosterone and increase estrogen, the problematic stagnant economy, and the dramatic rise of gals in all domains.

A PROGRAMMATIC APPROACH TO ASSESSING AND DEVELOPING GUYS’ SOCIAL SKILLS
Ronald E. Riggio
Drawing on a model for basic social communication skills, this presentation will discuss methods to assess the possession of basic emotional/nonverbal and social/verbal competencies. Examples of the training exercises will be given, and they will be applied specifically to developing “guys” social skills.
GETTING STARTED: PROMOTING EVERYDAY HEROES TO FOSTER EMPATHY AND THE RE-RISE OF GUYS
Shari Young Kuchenbecker
This presentation describes the use of “START Everyday Heroes” wristbands in conjunction with empathy training, mindfulness, and social-cognitive framing as a novel and inexpensive program for promoting pro-social valuing and skills, specifically helping behavior, in young males.

A “TALKING-CURE” APPROACH TO PROMOTING CONVERSATIONAL INTELLIGENCE AND SOCIAL CONNECTEDNESS
Bernardo J. Carducci, Ph.D.
To address the lack of social skills as a contributing factor to the social isolation of young males, this presentation will describe a five-step format for helping individuals to develop their conversational skills and offers suggestions for creating opportunities to practice developing conversational skills in day-to-day situations for the purpose of promoting social connectedness.
The work of Dr. Giuseppe Costantino, presented posthumously

IS031 QUALITATIVE PERSPECTIVES TO OFFERING SUPPORT TO INDIVIDUALS EXPERIENCING ANXIETY ASSOCIATED WITH PTSD AND SHYNESS

F08. EXPO 2015 Hot Topics - Life skills in culture and society
E05. Health and clinical intervention - Evidence-based psychotherapies

Convenor
Bernardo J. Carducci, Indiana University Southeast, New Albany - United States

Presenters
Bernardo J. Carducci, Indiana University Southeast, New Albany - United States
Elsa B. Cardalda, Ponce Medical School and Health Sciences, Ponce - Puerto Rico
Erminia Costantino on behalf of Giuseppe Costantino, American Multicultural Institute, New York - United States
Nuria Sabate, Private practitioner, San Juan - Puerto Rico

This symposium will focus on helping individuals respond more effective to two rather different expressions of anxiety—PTSD and shyness. Although these two expressions of emotion exist on highly different points along the anxiety spectrum, they are linked together in this symposium by a qualitative approach to research and practice that focuses on “listening to the stories” told by individuals about how they experience and attempt to cope with their respective feelings. In this symposium, the presenters will discuss how they use qualitative research techniques to develop programs to help individuals deal more effectively with expressions of PTSD and shyness.

The first presentation will discuss the usage of the Tell Me A Story (TEMAS) as a qualitatively based multicultural test and as an evidence-based Narrative Traumatic Therapy (TEMAS-TNT). It will also include a discussion of the Narrative Traumatic Therapy as it is presently being used in a large school-based trauma project in Brooklyn, NY involving 325 Latino children, ages 6-10. In response to recent studies highlighting that Hispanics are at greater risk for PTSD than other groups, the second presentation will discuss a program of qualitatively based research at the Medical School of Ponce, Puerto Rico attempting to treat PTSD in Puerto Rican children, ages 6 to 10, utilizing the TEMAS Narrative Trauma Therapy and will conclude with a discussion of the post-test assessment of this treatment program. The third presentation will discuss the characteristic features of shyness and the personal, social, and professional barriers shyness can create, along with a qualitative analysis summarizing and evaluating the self-selected strategies shy individuals use to deal with their shyness. The presentation will conclude with discussion offering guidelines for mental health professional to create shyness workshops to help both shy teens and adults deal more effectively with their shyness.

TEMAS IN THE ASSESSMENT AND TREATMENT OF TRAUMA SYMPTOMS AMONG LATINO CHILDREN
Ermina Costantino, Giuseppe Costantino, Leib Litman, Richard Waxman, and Air Maman

This presentation will discuss a treatment program utilizing the TEMAS Narrative Traumatic Therapy to examined traumatic stress, anxiety, and depression among 325 Latino children, ages 6-10, from three public schools in Brooklyn, NY.

TRAUMA EXPOSURE AND PTSD IN CHILDREN AND ADOLESCENTS IN PUERTO RICO

102
Elsa B. Cardalda, Nuria Sabaté, and James Porte
This presentation will describe a program of research assessing neurological and cognitive variables associated with PTSD and the use of TEMAS Narrative Trauma Therapy with Puerto Rican children in Puerto Rico to assess treatment effectiveness.

DON’T BE SHY ABOUT HELPING SHY INDIVIDUALS DEAL WITH THEIR SHYNESS: GUIDELINES FOR CREATING A SHYNESS WORKSHOP
Bernardo J. Carducci
This presentation describes strategies shy individuals use to deal with their shyness and offer guidelines for professionals to create a shyness workshop to address the cognitive, affective, and behavioral deficiencies exhibited by shy individuals.
IS032
PSYCHOLOGICAL DYNAMICS AND TECHNOLOGICAL CAREERS: SELF-CONCEPT AND SOCIAL-COGNITIVE PROCESSES IN STEM EDUCATION AND CAREER CHOICE

B07. Development and education - Social cognition, identity and social interactions

Convenor Daniel Cervone, University of Illinois at Chicago, Chicago - United States
Presenters Daniel Cervone, University of Illinois at Chicago, Chicago - United States
Elena Makarova, University of Bern, Bern - Switzerland
Rodolfo Mendoza-Denton, University of California, Berkeley - United States
Ursula Kessels, Free University of Berlin, Berlin – Germany
Discussant Anne Maass, University of Padova, Padua - Italy

A major challenge for 21st-century psychological science is to identify factors that contribute to individuals’ decisions to pursue and persist in science, technology, engineering, and mathematical (STEM) fields. The need for psychological research is particularly acute in light of the under-representation of women and persons of color in STEM fields in many industrialized nations. The aim of this symposium is to present a range of European and U.S.-based research programs that share a focus on the role self-concept (self-image, identity) and subjective beliefs about the relation between oneself and the social world (interpersonal relationship, the fit between oneself and academic domains, perceptions of supports in the educational environment) in STEM education and career choice. Presenters will report empirical findings on gender identity, conceptions of academic domains, and students’ preference regarding STEM careers; mentoring-based processes and their implications for students’ personal identity as scientists, particularly among students of minority status; gender-based conceptions of math and science fields and the implications of these conceptions for youths’ career choices; and subjective beliefs about supports and barriers in a STEM-education environment and their implications for self-efficacy beliefs and educational progress. The presentations and discussion will seek to underscore ways in which basic research on the self, social-cognitive mechanisms, and interpersonal dynamics can illuminate psychological factors that contribute to students’ desire to participate in STEM fields and their eventual development of successful and fulfilling careers in STEM.

SUBJECTIVE BELIEFS ABOUT THE SELF AND ENGINEERING EDUCATION: A PERSON-CENTERED SOCIAL-COGNITIVE ANALYSIS

Daniel Cervone, Lara Mercurio, and Carmen Lilley (University of Illinois at Chicago)

We present research employing person-centered methods that address both inter-individual differences and intra-individual variation in social-cognitive processes (self-concept; perceptions of educational supports and barriers; perceptions of self-efficacy). Findings relate these variables to educational progress among engineering students.

DOES SCIENCE SUIT ME? HOW ACADEMIC INTERESTS RELATE TO STUDENT’S IDENTITY

Ursula Kessels

The presentation summarizes findings from both correlational and experimental studies showing the importance of the perceived fit between an individual’s (gender) identity and (gendered) social
meanings of academic domains (such as STEM subjects) for students’ liking, choosing, and aspiring a career in the realm of STEM.

THE GENDER GAP IN STEM FIELDS: THE GENDER IMAGE OF MATH AND SCIENCE AND YOUTHS’ CAREER ASPIRATIONS
Elena Makarova, Belinda Aeschlimann & Walter Herzog (Univ of Bern)
The study is part of the Swiss National Research Program on “Gender Equality” and is based on a survey of 3,045 youth. It examines the occupational aspirations of female and male youth, the gender image of three science subjects among youth, and the impact of the gender image of math and science on young women’s career choice in STEM fields.

FOSTERING POSITIVE INTEGROUP MENTORING RELATIONSHIPS: IMPLICATIONS FOR STEM FIELDS
Rodolfo Mendoza-Denton
Inclusion of Other in the Self (IOS), a process where people incorporate close others' attributes into their self-concept, is evident in close relationships. We test whether close mentoring relationships also trigger IOS processes, potentially leading mentees to adopt a scientific identity, with implications for minority student retention.
Sponsored by
ECPA (European Association of Community Psychology)

**IS033**

**HAPPINESS AND GLOBALIZATION: “THE STRANGE BEDFELLOWS “OF OUR COMPLEX WORLD**

F01. EXPO 2015 Hot Topics - Capacities building and human development
E09. Health and clinical intervention - Positivity and well-being

Convenor Donata Francescato, Sapienza University of Rome, Rome - Italy
Presenters José Ornelas, ISPA – University Institute, Lisbon - Portugal
Norma De Piccoli, University of Turin, Turin - Italy
Patrizia Meringolo, SIPCO – Italian Society of Community Psychology, Firenze – Italy
Discussant Caterina Arcidiacono, University of Naples Federico II, Naples - Italy

Happiness as a theoretical construct is mainly used by economists, while psychologists have tried to identify the major components of this construct: quality of life (Veenhoover, 2012), individual (Keyes, 2010) and social wellbeing (Prilleltensky, 2012). Community psychology underlines the positive aspects of life within an ecological model constituted by individual, relational, organizational, environmental and cultural dimensions (Prilleltensky, 2011). It differentiates itself from positive psychology because community psychology focus also on collective experiences (and not only on individual features or personality variables). Community psychology moreover, is centered principally on second order changes, (Foster-Fishman, Nowell, & Yang, 2007; Watson, & Foster-Fishman, 2013) which are relevant in approaching problems and opportunities implied in globalization processes. Therefore in this symposium we aim to illustrate how the different components of happiness identified by various branches of psychology have neglected the social and environmental components of happiness. In a globalized world is increasingly urgent to take into account how social, economic, and cultural changes impact personal and social happiness. The term globalization has consistently been utilized to describe the dramatic changes the world is undergoing, as new technology and modern economics have led to increasingly interconnected economies and cultures. Most psychologists have stressed the manifold problems globalization processes have created especially in developed countries such as Europe. Few have explored the opportunities globalization also offer. Since community psychology underlines that we have to look for “meliors” and not only for “stressors” in our environment, in this symposium we will focus primarily on the positive aspects of globalization, that can foster relational wellbeing and happiness.

**WHY A COMMUNITY PSYCHOLOGY APPROACH FOR HAPPINESS AND WELL-BEING?**

Patrizia Meringolo

Facing issues as happiness and well-being, Community Psychology focuses on collective experiences (and not on individual features or personality variables). The presentation will illustrates also how Community Psychology manages and negotiates the conflicts, avoiding “pacifying” arrangements, and how it is oriented to second order systems changes.

**SEIZING THE OPPORTUNITIES FOR INCREASING OUR HAPPINESS AND WELL-BEING IN A GLOBALIZED WORLD**
Donata Francescato
Globalization offers several opportunities in the economic, social, cultural and educational domains which may help overcome many divides that characterize our conflictual society. By rebuilding trust, and rekindling interpersonal and social ties the wealth of diversities that now foster conflicts, can promote relational wellbeing and happiness.

THE SOCIAL RELEVANCE OF RESEARCH IN COMMUNITY PSYCHOLOGY: TOOLS FOR THE PROMOTION FOR CAPABILITIES AND WELL-BEING
José Ornelas
Community Psychology employs evidence-based practices that privilege what enhances individuals, groups or communities’s capabilities, and well-being, and focuses primarily on social movements and policies. Examples are described: a) capabilities for mental health; c) community leadership; c) Housing First - innovation to end homelessness.

AN ECOLOGICAL PERSPECTIVE TO PROMOTE HEALTH AND WELLBEING
Norma De Piccoli
In the modern Western world, health promotion is a central topic. This question is often developed in terms of healthy lifestyle, focusing on the individual responsibility, safeguarding the status quo. The presentation will highlight some theoretical and methodological tools consistent with a systemic-ecological analysis.

HOW HAPPY YOU ARE? MEASURING INDIVIDUAL FEELINGS AND THOUGHTS RELATED TO PLACES AND LIFE CIRCUMSTANCES
Caterina Arcidiacono
The Author presents first results of a research using a prototype app for smartphone (created with O.Gigliotta, S. De Martino e O.Miglino) measuring individual happiness in relation to life circumstances, places, and social contexts. This tool, gives also respondents a feedback concerning their moods in relation to specific circumstances.
IS034
IN MEMORY OF PROFESSOR LAURA D’ODORICO - MUSIC AND LANGUAGE IN THE DEVELOPMENT OF INFANT COMMUNICATION

Martine Van Puyvelde, Royal Military Academy, Brussels - Belgium
Simone Falk, University of Aix-Marseille, Aix-en-Provence (France); Ludwig-Maximilian University of Munich, Munich – France

Darwin speculated “…the rhythms and cadences of oratory are derived from previously developed musical power…. Musical sounds afforded one of the bases for the development of language” (1871, p. 336). Yet, only in the last decade the study of the relationship between language and music has received considerable attention in science. Language and music are the two main communication systems in humans – both have everyday usages studied by psychologists and neuroscientists on the one hand, and musicologists and linguists on the other; both have literacy forms associated with them, begging educational considerations; both have evolved artistic forms through human history and across different cultures; and both have brought art to the core of socially organized endeavors to promote cross-domain benefits (e.g., El Sistema: Majno, 2012). Although research has been fast-growing, how language and music interact in the ontogenesis of human communication from birth has remained largely unexplored. This symposium brings together interdisciplinary cutting-edge research aiming to uncover the missing link, that is, begging the fundamental question of how the relationship between language and music evolves during the early stages of human development. By exploring initial answers to such question/s, we aim to both contribute scientific objectives for a future agenda and impact on educational programmes, health and rehabilitation intervention. The speakers and their co-authors come from one North-American and five different European countries. They have developed groundbreaking research lines exploring the boundaries between spoken and musical interactions with infants, and they will report on their findings and ongoing studies. The discussion will identify state-of-the-art themes and shared objectives, aiming to create a network able to consolidate and further develop research on the interaction between language and music in the European and international context.

INFANT-DIRECTED SPEECH AND SONG: COMPARISONS AND OPEN QUESTIONS
INFANT DIRECTED-SONG AND -SPEECH, COMPARISONS AND QUESTIONS
Simone Falk
Falk gives an overview over the main characteristics of infant-directed (ID- henceforth) speech and song considering several languages and so identifying common aspects and differences. Infant differential responses to song and speech are discussed in function of language acquisition as well as in terms of infant and parental well-being.
WHEN MUSIC AND SPEECH COLLIDE: INFANTS’ PERCEPTION OF MELODY IN THE CONTEXT OF LYRICS
Christine D. Tsang and J. Bruce Morton
Tsang examines the impact of simultaneous speech and melody presentation on infants’ recognition of melody and words. Infants' recognition of words remained unaffected but their perception of melody deteriorated. The results suggest that 8-month-olds are highly sensitive to linguistic information to the detriment of other perceptual processing.

INFANT-DIRECTED SINGING, ATTENTION AND LANGUAGE DEVELOPMENT IN INFANCY
Fabia Franco, Tatiana Sobolewska and Iryna Kozar
Franco explores the relationship between early exposure to ID-singing and language development in two infant studies using preferential listening, parental reports and eye-tracking. The case is made for ID-singing showing strong relationships with various aspects of the early stages of language development.

EARLY ROOTS OF MUSIC AND LANGUAGE IN MOTHER-INFANT INTERACTION: THE INTERPLAY BETWEEN TONAL SYNCHRONY, SOCIAL ENGAGEMENT AND PHYSIOLOGICAL CO-REGULATION
Martine Vvan Puyvelde, Gerrit Loots and Nathalie Pattyn
Vvan Puyvelde shows that mothers and infants adapt their vocalizations to one another so that their pitches become tonally related. Music that corresponds to the characteristics of tonal synchronized vocal dialogues evokes physiological mother-infant co-regulation, which is essential for psychophysiological maturation and thus supports language development.

LIVE MATERNAL SPEECH AND SONG TO PRETERM INFANTS: BENEFICIAL EFFECTS, MATERNAL VOCAL MODULATION AND EMOTIONAL PROSODY
Manuela Filippa, Maya Gratier, Emmanuel Devouche, Didier Grandjean
Filippa reports an intervention study in which premature infants exposed to maternal vocal intervention (MVI) showed significant decrease in critical events and increase in oxygen saturation, both valid indicators of a better quality of life for preterm infants in the NICU. The musical dimensions of maternal speech predicted outcomes.
IS035
COMPLIANCE, RESISTANCE AND NEOLIBERAL VIOLENCE IN THE 21ST CENTURY: INTERNATIONAL CRITICAL VOICES

F09. EXPO 2015 Hot Topics - The psychological causes of economical crisis and its related costs for individuals, families and society

Convenor David Fryer, University of South Africa, Pretoria; University of Queensland (Brisbane) Australia; Australian College of Applied Psychology, Brisbane (Australia)

Presenters
- Carl Walker, University of Brighton, Brighton - United Kingdom
- Cathy McCormack, Community activist, author and broadcaster, Glasgow - United Kingdom
- Darrin Hodgetts, Massey University, Auckland - New Zealand
- David Fryer, University of South Africa, Pretoria; University of Queensland, Brisbane (Australia); Australian College of Applied Psychology, Brisbane (Australia) - South Africa

Discussant Saths Cooper, International Union of Psychological Science (IUPsyS); International Social Science Council (ISSC); National ICSU Board at the National Research Foundation of South Africa; University of Pretoria, Pretoria; University of Limpopo, Sovenga - South Africa

This symposium will bring together international critical and community voices to uncover and critique the violent subjection and re-subjection central to neoliberal violence around the world as recommended by Foucault, who argued that: “the real political task in a society such as ours is to criticize the workings of institutions that appear to be both neutral and independent, to criticize and attack them in such a manner that the political violence that has always exercised itself obscurely through them will be unmasked, so that one can fight against them. David Fryer (Australia) will set the scene by arguing that ‘unemployment’ and ‘mental ill-health’ are not independent phenomena in a cause-effect relationship but are, rather, two facets of socially constituted violence which functions to maximize the working of the neoliberal labour market in the interests of employers and shareholders. Darrin Hodgetts (New Zealand) will then draw upon his community research engagements with members of the NZ precariat, including homeless people, to reveal structural violence as a feature of everyday life. Carl Walker (England) will then draw both upon his work as convener of the European Community Psychology Association Task Force on the consequences of fiscal austerity and also his research on debt to describe neoliberal economies of affect and the UK debt collection industry as "a kind of mental warfare". Cathy McCormack (Scotland), a community activist, will then describe three decades of effective collaborative activist work with community and critical psychologists to uncover and resist the neoliberal "war without bullets" being waged against working people and resulting in misery, morbidity and mortality on a colossal scale. Saths Cooper (South Africa) will then respond as Discussant to the panel’s presentations, take questions from, and consider statements by, members of the audience about international neoliberal social violence and facilitate discussion.

DEPRIVATION, RESTRICTION AND CONSTITUTION: THE UNEMPLOYED SUBJECT FROM A CRITICAL STANDPOINT
David Fryer
A network of social elements, including discourses of unemployment and mental health, simultaneously: ‘makes real’ ‘the unemployed’; visits diverse forms of social violence upon them; and reconstitutes their subjectivity to (re)produce compliant human means of production required within the contemporary version of the neoliberal labour market.

PSYCHOLOGY AS POLITICAL STRUGGLE: PRECARIAT CLASSES, HUMANITY, COMPASSION AND HOPE

Darrin Hodgetts

Abstract: By ‘re-educating’ the criminalized poor to be compliant subjects for capital, individualistic psychologies contribute to the harm many communities experience, due to structural inequalities and social polarisation. I focus on how members of the precariat can be supported as they resist violent subjugation by state institutions and elite interests.

A KIND OF MENTAL WARFARE’: NEOLIBERAL ECONOMIES OF AFFECT AND THE UK DEBT COLLECTION INDUSTRY

Carl Walker

Abstract: Neoliberal social, political and economic transformations have enabled the development of personal debt industries where degrading and violent affective relations are central to re-forming neoliberal economic subjects, induce very particular forms of sustainable revolving debtor and inscribe the desires of a financialised world into their psyches.

THE WAR WITHOUT BULLETS

Cathy McCormack

Abstract: Neoliberalism takes the form of a "war without bullets" waged against poor, precariously and unemployed people and untold related misery, illness and death. I will describe over thirty years of collaboration with community psychologists, health scientists, climate activists and others, devoted to revealing and resisting neoliberal social violence.
It is increasingly difficult to accumulate research findings on competition into a coherent body of knowledge. Researchers represent different disciplines from the biological sciences to social sciences, and typically concentrate on the level of explanation that their scientific field represents. Researchers of neurobiology do not have a systematic collaboration with cultural psychologists or educational psychologists with personality or social psychologists. Therefore, scientific evidence is mainly discipline-based and not integrated into a bio-psycho-social-cultural model of interpersonal competition.

The proposed symposium brings together experts of competition with their research that represents different aspects of competition from the biological to the cultural, from neurohormonal reactions to the effects of social change. They study the individual e.g. the individual’s evaluative processes, achievement goals, competitive attitudes, coping with winning and losing and personality and also connect these to e.g. biological reactions and e.g. performance. They also investigate how culture may shape these individual reactions. Some of the talks discuss the relationship of competition to cooperation as well. The discussion will make an attempt to integrate these different perspectives, levels and results into an evolving bio-psycho-social-cultural model of competition.

**IMPORTANT OF THE APPRAISAL FOR THE PSYCHOBIOLOGICAL RESPONSE TO HUMAN COMPETITION.**

*Alicia Salvador, Raqual Costa, Miguel Angel Serrano, Vanesa Hidalgo, Esperanza Gonzalez Bono*

Psychobiological effects of competition are accepted as an example of the relationship between steroid hormones and aggressive/dominant behavior in humans. An increasing number of studies point out the importance of appraisal, evaluative processes and coping processes in understanding competitive interactions in men and more recently also in women.

**COMPETITION, COOPERATION, AND ACHIEVEMENT GOALS**

*Andrew Elliot*

My talk will focus on the link between motivational dispositions toward competition and cooperation on one hand, and the adoption of achievement goals on the other hand. Systematic links between the two types of constructs will be overviewed, and their joint involvement in predicting achievement-relevant outcomes will be examined. Avenues for future research will be envisioned.
PATTERNS OF COPING WITH WINNING AND LOSING
Márta Fülöp
In different studies three main patterns of coping with winning and losing emerge: the balanced, the narcissistic-aggressive and the avoidant-giving up. However, these patterns also demonstrate cultural and age differences. It will be discussed what may be considered universal and what culturally shaped in coping patterns with winning and losing.

FROM COOPERATIVE TO COMPETITIVE BEHAVIOR: NEW TRENDS IN SOCIAL INTERACTION AMONG MEXICAN CHILDREN AFTER FOUR DECADES.
Camilo García, Natanael Rivera
A series of experimental studies comparing the original 1970’s with current performance of children of same age, with same tasks and, in same settings, showed a shift from cooperative to competitive behaviors. The social motives choice cards, marble pull, and the cooperation board, showed higher competition as predicted by Greenfield’s theory.

COMPETITIVE ATTITUDES AND PERSONALITY TRAITS OF SUCCESSFUL AND NON-SUCCESSFUL STUDENTS IN ACADEMIC CONTESTS
Mihály Berkics, Márta Fülöp
Students taking part in academic contests and being successful or unsuccessful in them were compared regarding their attitudes towards competition, winning, and losing, and a variety of personality traits ranging from resilience to perfectionism. The relationship between personality traits and competitive attitudes was also analysed.
IS037
SKILL TRAINING WITH VIRTUAL REALITY AND VIDEO-GAME PLATFORMS

A09. General issues and basic processes - Learning and memory
A06. General issues and basic processes - Cognitive neurosciences and neuroimaging
D14. Work and organization - Workplace learning and training

Convenor Daniel Gopher, Technion – Institute of Technology, Haifa - Israel
Presenters Arthur Kramer, University of Illinois at Urbana-Champaign, Urbana-Champaign - United States
Danny Dankner, ACE-Applied Cognitive Engineering, Hod Hasharon - Israel
Emauele Ruffaldi, ACE-Applied Cognitive Engineering, Hod Hasharon – Israel
Discussant Daniel Gopher, Technion – Institute of Technology, Haifa - Israel

Contemporary computer and sensor technology created new and exciting opportunities for the development of simulators and skill trainers. In particular the application of videogame technologies to the training of cognitive skills and multimodal virtual reality platforms for training of perceptual motor skills. These new prospects raise challenges and dangers to the study of skill acquisition training and transfer which are briefly summarized below. The three presentations of the symposium will describe different aspects of the topic. They will be followed by a joint discussion.

**Videogame training of cognitive skills:** Development of training platforms for cognitive and executive control skills of daily performed tasks has become a focal interest in contemporary basic science and applied domains. It is nurtured on the one hand, by the progress in cognitive and brain sciences and on the other hand, by the increased awareness for the role and importance of cognitive skills in the performance of daily tasks across the life span. One appealing approach to the development of cognitive training platforms, is by adopting and developing videogame environments. Such games enable the development a more complex, dynamic and richer laboratory situations that are closer to daily tasks and demands, and may thus serve as improved training and transfer environments. Videogames and videogame like tasks may provide complex and dynamic tasks which impose high demands and require long duration of training to master. These have not only the potential to better simulate daily tasks and provide a controlled testing environment, but also constitute an enriched and improved research paradigm to study and explicate aspects and dimensions of coping with task load, attention management and executive control capabilities. For example, they are much richer and diversified in their demands than most present laboratory tasks employed to the study cognitive decline across the life span, or cognitive skills of different sports (basketball football, ice hockey etc.

**Training platforms in multimodal virtual reality:** Multimodal, immersive, virtual reality (VR) techniques open new perspectives for perceptual-motor skill trainers. They also introduce new risks and dangers. Training simulators for complex tasks are being used in increased frequency since the end of the Second World War, which also marks the beginning of the technological age revolution. With the growing complexity of systems and their operation environments, the required duration of training and the increased costs of errors, on the job practice became difficult or impossible and alternative training and simulation environments have been developed to enable skill acquisition and learning. With the advance of computer technology simulators become more and more hybrid. System dynamics, visual field of view and audition have been increasingly driven and generated by computers. Contemporary developments in sensors and display capabilities and the exponential increase in computation speed and storage capacity led the way to the development of multimodal virtual environments. In these environments, the operator is immersed, experience multimodal sensations and interacts with virtual objects including other humans (Riva 2006). Vision and audition have been in the study and design of simulators from their inception. The new and important addition
is the inclusion of haptics: the ability to feel and exercise force, touch, texture and kinematics. Haptic technology is developing rapidly and haptic interfaces are now been incorporated in many virtual worlds. It is hence a quite conservative expectation that the multimodal, virtual reality platforms will dominate the next generation of training simulators. From the vantage points of training, motor and cognitive sciences, this development carries with it some exciting prospects and serious challenges.

A TALE OF TWO TRAINING STRATEGIES
Arthur Kramer
Over couple of decades there has been an increasing interest in cognitive training, and in particular training that engenders transfer effects beyond the trained tasks. Research has taken different forms including the use of off-the-shelf video games, and commercially designed game versions of tasks. I will discuss our approach to training, transfer and retention of new skills. It represents an integration of Neuroscience, Cognitive Science, Human Factors, and Psychometrics in both understanding and predicting learning and transfer of complex cognitive skills.

MULTIMODAL SYSTEMS FOR TRAINING IN VIRTUAL ENVIRONMENTS
Emanuele Ruffaldi
The technological advancements in computing and sensing capabilities is empowering researcher in designing training systems capable of analyzing the performance level of trainee and providing precisely timed augmented feedback. The feedback is the result of a combination of different modalities ranging from the audio-visual to haptic feedback, depending on the training strategy. In this talk we will present the design challenges for training system in virtual environment with an emphasis on sport training highlighting a case study of a rowing training system.

COGNITIVE TRAINERS FOR SPORT - BASKETBALL AND ICE HOCKEY
Jacob Greenshpan  Danny Dankner
The talk will describe the main aspects of developing a desktop cognitive trainers for basketball and ice hockey. The trainers are a computer game like training platforms which capture the major cognitive demands of the game and are practiced away from the game fields. The talk will discuss principles, challenges and actual achievements of the developed applications.
Non-suicidal self-injury (NSSI), the deliberate destruction or alteration of body tissue without conscious suicidal intent, is a transdiagnostic behaviour that is used to cope with intense emotions and psychological distress. Equally common among males and females, NSSI can include cutting, burning or carving the skin and hitting or banging the self or hard objects. NSSI differs from suicidal behaviour (including ideation and attempts) in being more prevalent, being engaged in more frequently, typically involving non-lethal methods, and being driven by emotion regulation rather than a desire to end life. As such the aetiology of NSSI is markedly distinct from suicidal behaviour, necessitating a tailored approach to understanding and treating the behaviour.

This symposium will present new research findings from projects which attempt to better understand the aetiology and treatment of NSSI from both intrapersonal and interpersonal perspectives. Data from a longitudinal study of parent-adolescent dyads will shed light on how the family is impacted when a young person self-injures and offer some insights for family therapy. NSSI is largely resistant to treatment, but common among young people with depression. Predictors of NSSI outcomes among depressed adolescents treated with either a psychosocial approach or antidepressant medication will be presented with a view to identifying young people most at risk. Although impulsivity has been implicated in the decision to self-injure, few have systematically explored the relationship between different facets of impulsivity and self-injury. We will present a series of studies that explore the role of impulsivity in NSSI, including how impulsivity might be exacerbated under stress, among young adults who self-injure. Finally, neurobiological work in the field of NSSI is in its infancy. We will conclude the symposium by presenting novel findings from fMRI studies in an effort to develop a neurobiological model of NSSI.

**INTERPERSONAL AND INTRAPERSONAL FACTORS SHAPING AND MAINTAINING NSSI**

*Imke Baetens*

NSSI is related to both child and caregiver factors which shape and maintain self-injury. In this presentation, data from the first 3 wave longitudinal study (using both adolescent and parent data) examining several interpersonal risk factors and consequences of NSSI will be presented. Helpful elements for family therapy will be presented.

**PREDICTORS OF NSSI AND SUICIDAL BEHAVIOUR FOLLOWING TREATMENT IN DEPRESSED ADOLESCENTS**

*Glenn Melvin*
Suicidal ideation and NSSI are key markers of risk in depressed adolescents. This paper will present the suicidal and NSSI outcomes of a sample of adolescents who received psychosocial and/or antidepressant medication treatment for depression. Predictors of outcome will be presented in an effort to identify those at greatest risk.

WHEN IS NSSI ASSOCIATED WITH IMPULSIVITY?
Penelope Hasking
Self-report measures implicate impulsivity in NSSI, but there is little data on how people who self-injure cope under acute stressful situations and whether they are more impulsive when stressed. This paper will present the results of a series of studies testing under which conditions impulsivity might be related to NSSI.

NSSI AND THE BRAIN: TOWARDS A NEUROBIOLOGICAL UNDERSTANDING OF NSSI
Paul Plener
Although NSSI is prevalent among today’s youth, little is known about the underlying neurobiological mechanisms. Based on our fMRI studies, we will present results about the interplay between stressors, brain activation and pain. Different lines of research on NSSI will be combined to come up with a neurobiological model of NSSI.
IS039
THE IMPACT OF THE ITC GUIDELINES ON PSYCHOLOGICAL ASSESSMENT

A03. General issues and basic processes - Psychometrics

Convenor    Dragos Iliescu, University of Bucharest, Bucharest - Romania
Presenters  Aletta Odendaal, University of Johannesburg, Johannesburg - South Africa
            Fanny Cheung, The Chinese University of Hong Kong, Hong Kong - Hong Kong
            Ian Florance, The European Test Publisher Group (ETPG), Henley-on-Thames - United Kingdom
            Jacques Grégoire, University of Louvain, Louvain - Belgium
            Kurt Geisinger, University of Nebraska-Lincoln, Lincoln - United States

This session will focus on the ITC Guidelines and their impact on various areas in the practice of psychological assessment. The session will begin with a review of the work of the ITC in developing guidelines for tests and testing. It will look back at how these were developed in the past and describe current procedures for development as well as describing those guidelines that are already developed or currently under development. A number of existing Guidelines will then be discussed in more detail: the Guidelines on Test Use, the Guidelines on Test Adaptation, and the Guidelines for Quality Control. Finally, a survey among European test publishers will shed light on how test development and publishing in Europe has been influenced by the ITC Guidelines.

THE ITC GUIDELINES ON TEST USE
Aletta Odendaal
The International Guidelines for Test Use were developed in the late 1990’s and formally launched in 2000 (Bartram, 2001). The presentation will attend to the reasons for international guidelines on test use and a general description of the knowledge, skills, abilities and other professional characteristics required by test users, specified in terms of assessable performance criteria. In addition, applications of the guidelines will be discussed as general framework for test use standards and related specifications for test user qualifications or certifications. In this regard, the ITC guidelines on test use influenced the drafting of a clause on assessment in the Employment Equity Act in South Africa (1998) and EFPA utilised the guidelines as a systematic framework to develop detailed standards (Bartram, 2011), which were approved in 2007.

PRESENT AND FUTURE OF THE ITC GUIDELINES ON TEST ADAPTATION
Jacques Grégoire
A large number of psychological and educational tests are translated and adapted across languages and cultures. Unfortunately, the quality of these adaptations is sometimes rather poor, with harmful consequences for individuals evaluated with these tests. In order to improve the quality of adapted tests, the International Test Commission developed guidelines on test adaptation. The guidelines fall into four main categories: those concerned with the cultural context, those concerned with the technicalities of instrument development and adaptation, those concerned with test administration, and those concerned with documentation and interpretation. In this presentation, the rational underlying the guidelines will be explained. Some limitations of the current guidelines and directions for the development of a new version will be discussed.
GUIDELINES FOR QUALITY CONTROL IN SCORING, TEST ANALYSIS, AND REPORTING OF TEST SCORES

Kurt Geisinger

The ITC Quality Control Guidelines were developed to address the efficiency, and accuracy of the scoring, analysis and reporting of test results. They can be used on their own or in conjunction with the ITC International Guidelines for Test Use (2000). The nature of these guidelines will be discussed throughout the presentation.

HOW THE ITC GUIDELINES AFFECT TEST DEVELOPMENT AND PUBLISHING IN EUROPE

Ian Florance

Research carried out with the 26 key test publishing companies across Europe reports on how the ITC guidelines have affected test development and delivery over the past few years and what developments might affect these issues in the future and need to be reflected in guideline revisions.
Carpendale and Lewis (2010) criticized current understanding of social cognitive development, saying that too much emphasis is given to what is cognitive at the expense of what is relational. Relational problems are a common topic of psychotherapy, and relational skills are important for maintaining supportive social networks. Among clinical assessment instruments, the most efficient for understanding the complexity of a person’s mental representations of relationships and other people is the Thematic Apperception Test and similar storytelling techniques. Similarly, autobiographical narratives such as Pennebaker’s expressive writing and stream of consciousness speech show how people understand other people, themselves, and their relationships.

However, such stories and narratives give a wealth of data. This wealth requires a systematic approach to organizing the data to find the most helpful information. The objective of this symposium is to present three quantitative content analysis scoring systems that offer insight into specific kinds of relational cognition. Presenters will discuss research data supporting the validity of their systems for understanding their participants’ relational experience and behavior. Participants include priesthood candidates, latency-age children, and college students who were instructed to write or talk freely about a stressful experience: ending a romantic relationship. Methodological issues discussed include the applicability to adults of a scoring system designed for children; a common scientific criticism of TATs, that storytellers who wish to appear “good” (healthy) can influence the test’s results; and the adaptation process for story scoring manuals applied to less coherent personal narratives. The organizer will begin the session with a paper describing the scientific status and clinical usefulness of these methods. As discussant, she will reflect on theory, clinical applications, and future research needed on these systems.

THE SCIENTIFIC STATUS AND CLINICAL USEFULNESS OF THEMATIC APPERCEPTIVE TECHNIQUES (TATS)
Sharon Rae Jenkins

Our psychometric theories are made for tests of ability and self-rating scales of symptoms, traits, or behaviors that ask patients to make simple choices. TATs are not like that; instead of a clear, limited response structure, they sample thoughts that the patient structures for clinicians to understand. How do we join scientific and clinical views?
EVALUATION OF SOCIAL AND EMOTIONAL SKILLS OF PRIESTHOOD CANDIDATES THROUGH THE TAT
Tereza Soukupová, Petr Goldmann
TAT (Teglasí’s Empathy system) and Rorschach were used to evaluate social and emotional skills of 50 men who applied to study theology in a Roman Catholic seminary. The goal was to evaluate participants’ emotional resources, measure of autonomy, and capability of empathy. The results are discussed with regard to the clinical usability of TAT.

EXPLORING CHILDREN’S DEFENSIVENESS TO THE TELL ME A STORY TEST (TEMAS)
Francesca Fantini, Erica Dell’Acqua, Aglaia Banis, Filippo Aschieri
This study examined defensiveness in 40 Italian children aged 9-10 to the TEMAS. Children were randomly assigned to fake-good and control conditions. The defensive attitude of the fake-good group reduced verbalization of negative emotions, but most cognitive indicators and personality function scores did not differentiate the two groups.

APPLYING INTERPERSONAL DECENTERING TAT SCORING TO EXPRESSIVE WRITING AND STREAM OF CONSCIOUSNESS SPEECH
Sharon Rae Jenkins
Content analysis TAT scoring systems used in research on human motivation have been applied to various other autobiographical materials. Can the same be done with clinical systems? This presentation discusses the process of adapting the Interpersonal Decentering scoring manual designed for stories to written expressive writing and stream of consciousness speech.
THE BIG PICTURE OF TAT STORY ANALYSIS: FOUR COMPREHENSIVE SYSTEMATIC APPROACHES

Storytelling about pictures has long been an important clinical assessment technique because it yields much rich information about many aspects of patients’ personalities and problems, especially aspects that are unique to that patient. Interpreting this rich information to understand a patient well requires years of training and often relies on complex theories. Systematic approaches to comprehensive analysis of stories have been developed to make training more efficient and to help clinicians organize and apply this information effectively. These approaches are based on comprehensive theories that may apply to many kinds of data, especially Rorschach and TATs.

The objective of this symposium is to present four comprehensive theory-based approaches to understanding a patient's problems by analyzing TAT stories. Each presenter will describe a different comprehensive approach to story analysis and show how it applies to a specific population. Patient populations included women with eating disorders, juvenile offenders, and women with gynecological cancers; one paper studied randomly selected nonpatient Brazilians. The organizer will begin the session by describing the challenges faced by those who create and use these methods and the benefits to be gained by using them well. As discussant, she will reflect on clinical applications and future research needed with these systems.

THE SEDUCTIVE THEORETICAL RICHNESS AND SCIENTIFIC CHALLENGES OF THEMATIC APPERCEPTIVE TECHNIQUES (TATS)
Sharon Rae Jenkins

The history of TATs began with immersion in storytellers’ life-worlds, a fertile ground for theory. Early clinical approaches were exhaustive efforts to classify everything interesting in stories. What can be lost in this seduction is a sense of purpose, like a therapist who is so drawn into a patient’s sessions that no therapeutic change occurs.

ASSESSING DEFENSIVE BEHAVIOR DIVERSITY AMONG ADOLESCENTS WITH EATING DISORDERS: A QUANTITATIVE APPROACH USING TAT
Sarah Vibert, Caroline Hurvey

Shentoub and collaborators propose quantitative and qualitative interpretation of narratives in a psychoanalytic view and theory of the “TAT process” in subjects’ manifest narratives. The discourse analysis sheet reveals subjects’ defense mechanisms and psychic behavior in the construction of narratives by 50 adolescent female inpatients.
A PSYCHODYNAMIC INVESTIGATION OF THE PERSONALITY OF JUVENILE OFFENDERS
Leila Salomão de La Plata Cury Tardivo, Maria Cecilia Vilhena, Junior Deconti
Deprivation, negligence and victimization are frequent among Brazilian juvenile offenders. In a psychodynamic view, this study compared 30 juvenile offenders and a control group on quantitative scores from Leopold Bellak’s Blank: their view of themselves and the world, self-image, object relations, defense mechanisms, superego and ego integrity.

THE USING AND THE INTEREST OF TATS IN A FRENCH STUDY ABOUT SEXUALITY OF PATIENTS AFFECTED BY GYNECOLOGIC CANCERS
Elisa Venturini, Marjorie Roques
The anatomical and physiological changes of treatment for gynecologic cancers may undermine representations of the woman’s body, and induce her to question her femininity, ideas of motherhood, and body aesthetic. Qualitative TAT test-retest during and after treatments of 15 women in France showed the impact of the treatments on their sexuality.

THE THEMATIC APPERCEPTION TEST (TAT) IN ADULTS: BRAZILIAN NORMATIVE DATA FOR THE MORVALIAN SYSTEM
A. Scaduto, V. Barbieri, M. A. Santos
This project developed norms for the TAT (Morvalian System) in adults from a non-clinical stratified sample (gender, social-economical level, schooling and age) in the Brazilian state of São Paulo with N = 96 randomly selected persons and 20 TAT cards. Results suggest indicators related to intrinsic card properties and social-demographic variables.
IS042
SELF-CONTROL SUCCESS AND FAILURE. IMPLICATIONS FOR UNDERSTANDING AND CHANGING SELF-DEFEATING BEHAVIOR

A11. General issues and basic processes - Motivation and emotion

Convenors Catalina Kopetz, Wayne State University, Detroit - United States
Reinout Wiers, University of Amsterdam, Amsterdam - Netherlands

Presenters Alexis Matusiewicz, VA Ann Arbor Healthcare System and University of Michigan Medical School, Ann Arbor - United States
Edward Orehek, University of Pittsburgh, Pittsburgh - United States
Reinout Wiers, University of Amsterdam, Amsterdam - Netherlands
Wilhelm Hofmann, University of Cologne, Cologne – Germany

Self-control failure is often invoked to understand self-defeating behaviors such as extreme risk taking, addiction, self-harm, etc. However, what may appear as a self-control failure may actually represent peoples’ strategic goal pursuit. The current symposium examines these two sides of self-control and explores the cognitive and motivational factors underlying self-control success and failure and their implications for self-defeating behavior. Specifically, we will discuss 1) how situational and social factors may result in self-control conflicts with uneven self-control success; 2) engagement in self-defeating behavior (self-harm and risk behavior) as goal-directed behavior rather than self-control failure; 3) potential strategies and mechanisms of change in self-control.

SELF-CONTROL SUCCESSES AND FAILURES IN EVERYDAY LIFE
Wilhelm Hofmann
An experience sampling study was conducted to investigate self-control success and failure. Participants furnished reports of desire episodes and completed personality measures of BIS/BAS, trait self-control, perfectionism, and psychological entitlement. Results suggest that desires are frequent, strong, and often marked by conflict which in turn elicits resistance with uneven success.

RISK TAKING AS MOTIVATED ACTION
Catalina Kopetz
Four studies tested the notion that risk taking represents a means to people’s current goals rather than a self-regulatory/self-control failure. The results show that 1) risk taking increases when it is perceived to be instrumental to individuals’ active goals; 2) the presence of cognitive resources augments this effect; 3) the presence of alternative means relevant to current goal reduces this effect.

DISTRESS AND RISK BEHAVIOR IN BORDERLINE PERSONALITY DISORDER: A SELF-REGULATORY PERSPECTIVE
Alexis Matusiewicz
Two studies investigated risk taking as strategic response to meet emotion regulation goals in Borderline personality disorder (BPD) participants. Results from both studies revealed that women with BPD showed increased risk behavior under distress as a function of 1) cognitive resources, 2) intensity of emotion regulation goals and self-efficacy for emotion regulation.
WILLINGNESS TO BECOME A MARTYR AS A GOAL DIRECTED BEHAVIOR
Edward Orehek

We explored willingness to become a martyr as a function of self-contrual. The results show that interdependent self-construals, which reflect connection to others and the ability to extend oneself through time and space, attenuate death anxiety and induce a greater willingness to become a martyr. These results support martyrdom as a behavior enacted to fulfill individual’s needs for significance.

OVERCOMING SELF-CONTROL FAILURE THROUGH COGNITIVE BIAS MODIFICATION
Reinout Wiers

Self-control dilemmas and failure can be overcome through cognitive bias modification, which has shown promising results in a clinical setting (attentional re-training Schoenmakers et al., 2010; approach-bias re-training, Wiers et al., 2011; Eberl et al., 2013). I will here present new data on internet-based cognitive bias modification for alcohol use, smoking, and overeating.
Trauma-Focused Cognitive Behavioral Therapy (TF-CBT) is an evidence-based treatment that has been evaluated and refined during the past 25 years to help children and adolescents recover after trauma. TF-CBT is a structured, short-term treatment model that effectively improves a range of trauma-related outcomes in 8-25 sessions with the child/adolescent and caregiver. Although TF-CBT is highly effective at improving youth posttraumatic stress disorder (PTSD) symptoms and diagnosis, TF-CBT also effectively addresses many other trauma impacts, including depressive and anxiety symptoms, cognitive distortions about the trauma, and behavioral problems, as well as improving the participating caregiver’s personal distress about the child’s traumatic experience, effective parenting skills, and supportive interactions with the child. While TF-CBT was originally developed to address the needs of children who experienced sexual abuse, over the past 15 years it has been used and studied for many other populations of traumatized youth, including those exposed to traumatic loss, domestic violence, and large scale disasters. Research now documents that TF-CBT is effective for diverse, multiple and complex trauma experiences, for youth of different developmental levels, and across different cultures.

The objectives of the symposium are to describe the development of TF-CBT for youth with complex trauma presentations, international studies of its efficacy, and TF-CBT dissemination projects in the U.S.A. and around the world.

**TF-CBT FOR COMPLEX TRAUMA**

*Judith A. Cohen*

This presentation describes practical strategies for implementing TF-CBT for youth with complex trauma, including dedicating more time to stabilization skills, implementing the Safety component early in treatment, titrating gradual exposure more slowly as needed by individual youth, and incorporating unifying trauma themes throughout treatment.

**WEB-BASED TF-CBT RESOURCES**

*Benjamin Saunders*

Online TF-CBT learning resources and evaluation data will be presented. TF-CBTWeb is a 10-hour course with 200,000 registered users. CTGWeb teaches how to apply TF-CBT to cases of child traumatic grief. TF-CBTConsult is an online consultation resource. How best to use these resources in training and implementation projects will be discussed.
A RANDOMIZED CONTROL TRIAL OF TF-CBT IN ZAMBIA
Laura Murray
A randomized controlled trial of TF-CBT was conducted by lay counselors in five community settings in Lusaka. There was a statistically significant decrease from baseline to post-assessment in trauma and functional impairment scores in the TF-CBT group compared to the wait-list group. TF-CBT was an effective treatment for youth in Zambia.

EFFECTIVENESS OF TRAUMA-FOCUSED COGNITIVE BEHAVIORAL THERAPY (TF-CBT) IN GERMAN CHILD AND ADOLESCENT MENTAL HEALTH CLINICS
Lutz Goldbeck
At eight German child mental health clinics, 150 patients with PTSD ages 7-16 years will be enrolled. Half of them will be randomly assigned to TF-CBT and the other half to a wait-list. Therapists receive intensive training and supervision. By May 2014, 122 patients have been recruited. Preliminary outcome data of the study will be discussed.
IS044
THE ADAPTATION OF IMMIGRANT CHILDREN AND YOUTH FROM DIFFERENT ETHNICITIES AND HOST COUNTRIES: WHO SUCCEEDS AND WHY?

C07. Culture and society - Race and ethnicity

Convenor  Frosso Motti-Stefanidi, University of Athens, Athens - Greece
Presenters  Birgit Leyendecker, Ruhr University Bochum, Bochum - Germany
            Dagmar Strohmeier, University of Applied Sciences, Linz - Austria
            Natasha Cabrera, University of Maryland, College Park - Austria
            Peter F. Titzmann, University of Zurich, Zurich – Switzerland

Immigrant children and youth comprise a sizable and integral part of contemporary societies. Their successful adaptation becomes a high-stakes issue for them and for society. However, they are faced with developmental and acculturative challenges, as well as with contextual stressors, such as poverty and discrimination, that place strain on the adaptation process (García-Coll& Marks, 2012). In spite of the challenges they face, most of them adapt well in their new countries. However, significant variability has been observed in their adaptation depending on children’s age and ethnicity, developmental domain (Marks et al., 2014), and host country (e.g., Sam et al., 2008). To help promote their positive adaptation it is crucial to understand who among immigrant children and youth do well with respect to these challenges, concurrently and over time, and why. This symposium includes presentations from 5 different countries and two continents (Europe and USA), focusing on 5 different ethnic groups, which address this issue. Their focus is on adaptation with respect to core developmental and acculturative tasks (e.g. academic achievement, peer relations, self-regulation), and/or psychological well-being (self-esteem) and mental health (psychological symptoms). The main objectives of the symposium are to examine whether and how, first, intergroup relations and acculturative processes and, second, family functioning and individual attributes contribute to and/or explain positive adaptation and psychological well-being among immigrant children and youth. Together, these presentations suggest that to understand who among them succeeds and why, one has to integrate the developmental, acculturative and social psychological perspectives to the issue, taking into account that, like all youth, they are developing organisms, but that, unlike nonimmigrants, they have to face some unique ecological circumstances, such as their immigrant status and culture.

ETHNIC FRIENDSHIP HOMOPHILY AND ITS PREDICTORS
Peter F. Titzmann
Ethnic friendship homophily means that immigrants predominantly form intra-ethnic friendships. The research presented shows that an acculturation, an intergroup, a developmental, and a context perspective have to be combined to better understand inter-individual variation in this phenomenon and to break ethnic friendship boundaries.

MULTI-ETHNIC IDENTITY AND ACCULTURATION ORIENTATIONS AS RESILIENCIES AGAINST THE ADVERSE EFFECTS OF DISCRIMINATION EXPERIENCES FOR PSYCHOLOGICAL HEALTH AMONG TURKISH IMMIGRANT YOUTH
Dagmar Strohmeier & Aysun Dogan, Ege
The link between discrimination and psychological health among immigrant youth (282 Turkish immigrants) was examined, in connection with ethnic identity and acculturation orientations. Discrimination experienced by teachers had the most adverse effects predicting a lower integration and assimilation orientation and a higher separation orientation.

FAMILY AND INDIVIDUAL FACTORS ASSOCIATED WITH TURKISH IMMIGRANT AND GERMAN CHILDREN’S AND ADOLESCENTS’ MENTAL HEALTH AND WELL-BEING
Birgit Leyendecker, Julia Jäkel, Alexandru Agache, & Uwe Wernekink
We examined family and individual factors associated with the socio-emotional well-being, strengths and difficulties of Turkish immigrant children and adolescents in comparison with their German peers (n= 480). Findings suggest that factors associated with mental health and well-being are both cross-culturally comparable and culturally specific.

LATINO IMMIGRANT MOTHERS’ AND FATHERS’ GOALS AND VALUES: SUPPORTING CHILDREN’S SELF-REGULATION AND SOCIAL COMPETENCE
Natasha Cabrera
Although Latinos are the largest immigrant ethnic group in the U.S., we know little about how they socialize their children. The key question I address is whether and how the quality of mother-child and father-child relationship mediate the association between parents’ goals and values and children’s social and regulatory behaviors?

RISKS AND RESOURCES FOR IMMIGRANT ADOLESCENTS’ ADAPTATION DURING A PERIOD OF ECONOMIC DOWNTURN
Frosso Motti-Stefanidi & Jens B. Asendorpf
The role of potential risks (social status, classroom context) and resources (parental school involvement, self-efficacy beliefs) for the adaptation of two cohorts (in middle school before and during the Greek economic crisis) of immigrant and nonimmigrant youth (N=2000) was examined. Results confirm the ordinary magic of normative human resources.
The term "prosocial behavior" has gained a strong presence in the vocabulary and also in the scientific field since the 70's. Throughout the time, the studies on prosocial behavior have gained a place not only in the psychological area, but also in other disciplines. However, as highlighted by a recent study conducted by the LIPA (i.e., Applied Prosocial Research Laboratory of the Faculty of Psychology, Autonomous University of Barcelona) we have found a great interest of the scientific community for deepening the research on prosocial behavior, whereas there is less involvement in applied research, that is, on programs entirely designed to enhance prosocial behaviors across the life span and in different contexts and cultures (Escotorin, 2013).

Indeed, as posited by Massey and Barreras (2013): “research has the potential to play a role in social and political change or is useful as a tool for advocacy or activism”. Throughout its history, LIPA has been part of eleven European transference programs for promoting applied prosociality. From our experience in intervention programs related with the promotion of prosocial behaviors, there are still very few links between the results of the research and public policies. This Symposium proposes to create a dialogue between the research on prosocial behavior and its applications in the social context, as well as on according ways to inform public policies and generate social dialogue through our outreach activities and specific proposals for public action.

“Prosocial Applied Research: Transferability and social innovation” is a symposium which has the following main objectives:
Show the uniqueness of programs aimed at the promotion of prosociality in very different cultural and social environments.
Generate a dialogue between experts on the applicability of intervention programs on prosociality (as well as social responsibility through prosociality) in different social environments.
Discuss findings about the social impact of these programs and their evaluation (i.e., impact validity).
Discuss the benefits of social transferability in areas not only exclusively related with educational formal settings but also with other organizational and social contexts.
EUROPEAN PROJECT SPRING (ALFA): PROSOCIAL INTERVENTIONS TO GENERATE EQUAL OPPORTUNITIES FOR GRADUATES IN LATIN AMERICA ACCESSING THE LABOR MARKET

Pilar Escotorin Soza, Conrad Izquierdo, Marc Brundelius

The European project SPRING (Social responsibility through PRosociality based INterventions to Generate equal opportunities) is being implemented in six universities in Latin America. The purpose of SPRING is to provide equal access to opportunities on the labor market for poor or otherwise socially excluded university graduates in Latin America. In SPRING, universities undertake a process of modifying the syllabus of specific courses by incorporating methodologies which help individuals to create empathetic, collaborative and inclusive interpersonal relations at university as well as at the future workplace. Second, SPRING promotes an inter- and intra-organizational dialogue, applying the concept of prosocial responsibility and empowering universities as territorial social agents, generating relations of trust with their stakeholders.

Prosocial relations between students coming from a socially disadvantaged background, university lecturers as well as employers can produce positive changes regarding their respective thoughts, feelings and actions, and regarding the patterns of interaction and organizational culture of universities and employers.

The SPRING project bases its proposal on a study of the state of the art (Gamboa and Avendaño, 2013) and 18 Focus Group conducted in 6 countries. These results reaffirm why it is necessary to make curricular innovation from the point of view of prosociality and why it is relevant to generate programs of prosocial applied research at the workplace.

The intervention model is based on Participatory Action Research. Starting from an inductive-dialogue oriented approach, the complex concept of prosocial responsibility is being elaborated on. In parallel, the groups are equipped with instruments to collect information during the different stages of the change process. The educational and organizational dimensions of the intervention are being analyzed both quantitatively and qualitatively.

Given its innovative design and the intrinsic interest pursued by the project, the description of the six generated models of participation is suggested. It is also discussed how each model responds to the local conditions of its implementation, contributing a cross section view of how the issues dealt with in SPRING can be tackled from a prosocial responsibility point of view.

PROSOCIAL EDUCATION PROJECT IMPLEMENTED IN THE SLOVAK EDUCATIONAL SYSTEM

Andrej Rajsky – Ivan Podomanicky– Martin Brestovansky

During the reform of state educational system in Slovakia at the beginning of 90's the mode of alternation between two compulsory optional subjects – religious education / ethical education – was decided to be undertaken. The subject Ethical education was introduced to school praxis in 1993, with content and didactics based on Roche Olivar's prosocial education concept. Five slovak universities (Trnava, Bratislava, Nitra, Banská Bystrica, Prešov) offer academic programmes for ethical education teacher trainings and focus on research in prosocial and moral education. During twenty years approx. four thousand graduates were educated who actively perform Ethical education at 90% of all slovak elementary and secondary schools. There are various investigations focused on reflection, evaluation, and actualization of the programme from the date of subject introducing till now. Our paper discuss some partial findings of the actual research at Trnava University aimed to validate and prove the Ethical education effects on positive changes in pupil's prosocial reasoning and behavior.

UNIVERSITY SOCIAL RESPONSIBILITY AND PROSOCIAL BEHAVIOR

Juan José Martí, Manuel Martí, and Gonzalo Almerich
Symposia 001 - 156

Social Responsibility at the University has been conceptually developed over the twentieth century from different perspectives and driven in this current century. The aim of this research was to identify the psychological variables that influence in prosocial behavior. Human values and empathy were associated in the self-attribution of socially responsible behaviors. The research design was a crosscutting survey, based on a non-probabilistic and accidental sampling. The sample consisted of 861 students of Latin American public and private universities in Spain, Chile, Colombia and Peru. The study is pioneer in the evaluation of the three constructs as in the procedure, which was an online platform used in order to collect the questionnaires responses. This is the first study conducted with college students from different Latin American countries where the self-attribution of social responsibility, empathy and values were evaluated. The results indicate that college students show a high frequency of socially responsible behaviors but no more prosocial intentionality thereof. Also, the results show the values and empathic variables that help to promote the development of socially responsible behaviors in university students. Domains as Tradition, Conformity and Benevolence, together with the cognitive empathy scale of "Perspective Taking", predict these high frequency social responsibility behaviors and respect for shared spaces, coexistence and civic and academic responsibility, among others. This research provides insights into the psychological variables that will affect being socially responsible, enabling to address from the University the training impact of well qualified professionals and highly regarded for his duty to society. The aim of this presentation is to contribute to the discussion about contents and methods leading to the successful transfer of prosociality into the practice at Universities.

Positive Effects of a School-based Intervention for Promoting Prosocial Behavior in Italian Adolescents: Who Benefits Most?

Maria Gerbino, Bernadette Paula Luengo Kanacri, Gian Vittorio Caprara, Concetta Pastorelli, Antonio Zuffianò

Prosocial behaviors (i.e., voluntary actions intended to benefit others by helping, caring, sharing; Eisenberg, Spinrad, & Knafo, 2014) are considered integral to intervention goals that seek to promote successful youth development. In effect, as highlighted by a good amount of empirical research, the benefits of helping others extend throughout development by bringing long-term positive outcomes into adulthood (see Carlo, Crockett, Randall, & Roesch, 2007). Within the wider framework of the Positive Youth Development (Lerner et al., 2005), the specific theoretical rationale underlying our intervention stems from the integration of various research traditions related to personality and social development, which address the personal roots of prosocial behaviors. The new school-based intervention, called Promoting Prosocial and Emotional Skills to Counteract Externalizing Problems in Adolescence (Italian acronym CEPIDEA), is unique in that it is entirely designed to promote prosocial behaviors and includes the promotion of four main components as its main determinants: (a) prosocial values; (b) emotion regulation skills; (c) perspective-taking skills; and (d) interpersonal-communication skills. Whereas recent findings have attested the positive effects of the CEPIDEA program in increasing adolescents’ prosocial behavior and academic achievement, and in countering physical aggression among early adolescents (Caprara et al., 2014), the present study aims to extend the assessment of CEPIDEA intervention, by examining whether adolescents’ personality profiles moderates the long-term (follow-up at 18 months) effects of CEPIDEA on prosocial and aggressive behaviors.

The intervention took place at two middle schools located in Genzano, near Rome. The intervention group included 151 students (72 females; M_{age}=12.4) and the control group included 140 students (78 females; M_{age}=12.6). Cluster analysis identified four adolescents’ personality profiles: resilient, vulnerable, overcontrollers and undercontrollers. The analysis of covariance revealed a moderating effect of personality profiles on interventions effects. In particular, students with undercontrolled profiles benefited more from the intervention in terms of increase in prosocial behaviors and decrease in aggressive behavior. Thus, the intervention appears to make promising contributions to promoting prosocial behaviors and in countering aggressive behaviors especially in those adolescents who are more at risk of maladjustment.
THE CREATIVE BREAK-OUT METHODOLOGY TO PROMOTE PROSOCIAL BEHAVIORS IN THE SCHOOL CONTEXT: THE MOST PROJECT EXPERIENCE (SCFF)

Mauro Cozzolino, Giovanna Celia, Margherita Baione

The Creative break out is a methodological approach and a practical tool that enhances good communication and improve relationships within different types of relational contexts, increasing self-awareness and prosocial attitudes. The tool has been developed and implemented within the EU-funded project MOST (Motivation to study) born thanks to the collaboration among different European organizations with the aim to contrast school-drop out increasing pupils’ motivation to study. In particular, an innovative training model for teachers has been developed in order to improve teachers’ competence and skills to strengthen pupils’ motivation to study, within an approach based on the promotion of prosocial behaviors and attitudes within the school context.

The Creative break out technique is one of the methods that are part of the didactical kit for teachers developed within MOST project, but it can be applied to different relational contexts with the aim to help individuals learn how to use communication strategies and relational styles to increase their sense of belonging to that contest and to promote effective communication, prosocial behaviors and good relations.

The method, whose theoretical background can be identified in the constructivism and the social cognitive psychology, is based on the assumptions that everyone perceives the reality through their personal characteristics and experiences, and that there is a mutual influence between perceptions (about ourselves, the others and the environment) and our typical relational style. Therefore, the one and only “reality” does not exist. On the contrary, there are common mechanisms that come from cognitive needs of our mind, such us functional fixedness, as well as typical relational styles that can deeply affect interpersonal relationships creating conflicts and relational difficulties.

The intervention is focused on the development of self-awareness about typical characteristics of our mind when we are in relationship with someone else, providing strategies that can enable to overcome the typical traps of our mind-functions processes and to enhance social skills and prosociality. Facilitating the awareness about how we think in regard to others, how we construct judgments and stereotypes, or how we see emotionally other people, means to promote a change in typical relational styles that will affect relationships improving prosociality and wellbeing.
IS046
SCHOOL-BASED TREATMENT WITH CULTURALLY DIVERSE CHILDREN

C02. Culture and society - Family systems and processes
C07. Culture and society - Race and ethnicity
C18. Culture and Society - School setting

Convenor  Caroline "CC" Clauss-Ehlers, Rutgers University, New Brunswick - United States
Presenters  Alina Camacho-Gingerich, St. John’s University, New York - United States
Caroline "CC" Clauss-Ehlers, Rutgers University, New Brunswick - United States
Elizabeth Jensen, The College of New Jersey, Ewing Township - United States
Rafael Art. Javier, St. John’s University, New York - United States

The purpose of this invited symposium is to present an overview of school-based treatment approaches with culturally diverse children. While the perspective presented is largely U.S.-based, international implications are also considered. Based in part on recent contributions to the Handbook of Culturally Responsive School Mental Health: Advancing Research, Training, Practice, and Policy (Clauss-Ehlers, Serpell, & Weist, 2013), and contributions to the book Community Planning to Foster Resilience in Children (Clauss-Ehlers & Weist, 2004), symposium presentations reflect key themes in the advancement of culturally responsive school mental health. Presentations aim to contribute to current knowledge about school-based intervention programs that promote positive outcomes among diverse youth. In addition, our focus on diverse youth challenges the assumption that child development is a similar process for all children. Rather, panel presentations demonstrate the wonderful variability in child development and underscore the impact of culture, race, gender, ethnicity, ability, religion, language, customs, and other variables on resilience and developmental trajectories. Participant learning is encouraged through the following objectives: 1) to better understand aspects of ethnic and racial identity development among adolescents; 2) to better understand the role of school personnel in the promotion of positive youth outcomes; 3) to better understand resilience within a cross-cultural context; and 4) to better understand implications of research, policy, and practice for the advancement of the field. Each objective includes practice considerations.

THE RACIAL/ETHNIC IDENTITY DEVELOPMENT OF DIVERSE ADOLESCENTS: IMPLICATIONS FOR SCHOOL-BASED INTERVENTIONS
Caroline S. Clauss-Ehlers
This presentation starts off the panel by providing an overview of key terms. Based on the chapter The Racial/Ethnic Identity Development of Tomorrow’s Adolescents included in the Handbook of School Mental Health, the salience of race and ethnicity for diverse adolescents is presented. Implications for working with diverse youth in school settings are discussed.

TRANSFORMATIVE ROLES FOR SCHOOL PERSONNEL
Elizabeth Jensen
This presentation focuses on the evolving role of school personnel and efforts to promote positive youth outcomes. Based on the chapter From Guidance to School Counseling: New Models in School Mental Health included in the Handbook of School Mental Health, the many ways that school personnel can effectively engage youth and their families is presented.
ASSESSING RESILIENCE IN A MULTICULTURAL CONTEXT: A LOOK AT THE IMMIGRANT EXPERIENCE
Alina Camacho-Gingerich
This presentation will address the relevant issues related to the definition and assessment of resilience and risk factors within the immigration experience of Latino immigrants. In this context we will address the problem of defining the Latino individual, issues of resilience in general and specifically with Latinos, protective factors in the Latino context, and general recommendations. The presentation will include a discussion of how cultural influences interact with normal developmental pathways within the context of the immigration experience to give rise to new self definition as an immigrant Latino.

STATUS OF RESEARCH, PRACTICE, AND POLICY: NEXT STEPS AND FUTURE PLANS
Rafael Art. Javier
This concluding presentation builds on previous discussion. It focuses on exploring the status of research and practice for school-based intervention and treatment with culturally diverse youth. The presentation provides an overview of the state of the field from both a US domestic and international perspective. Implications for research and practice moving forward are presented.

References
Prosocial behavior, voluntary behavior intended to benefit another, is of obvious importance to the quality of interactions between individuals and among groups. Cross-cultural research has indicated that prosocial behaviors in early childhood predicts positive developmental outcomes for children.

Cooperation produces mutually beneficial outcomes yet is costly for an individual. Why would an individual be willing to perform costly cooperative behavior that benefits another individual? One alternative explanation for cooperation in human large groups is systems of rewards or punishments (Oliver, 1980; Sigmund, Hauert, & Nowak, 2001).

Some of the most fundamental questions concerning prosocial behavior and altruistic punishment are still needed to be investigated. This symposium is composed of four studies conducted in Hungary, the UK and China, respectively. The common focus of these studies is on children’s prosocial behaviors and the role of altruistic punishment. This symposium focuses on children’s prosocial behavior and altruistic punishment to discuss the following issues: 1) Primary school children’s understanding of cooperation; 2) the relationship in prosocial behavior, social identity and academic competence in three countries; 3) the factors affecting children’s, adolescents’, and adults’ altruistic punishment; 4) the effect of punishment on cooperation in children with high-functioning autism.

**PRIMARY SCHOOL CHILDREN’S UNDERSTANDING OF COOPERATION**

Márta Fülöp, Nóra Sebestyén, Mónika Sándor

The present study aimed at studying 8-9 years old primary school children’s (n=58) comprehension of cooperation with two different methods (free associations and drawings). The results show that children mainly interpret cooperation as working together in a team, helping each other, being friends and they attach positive emotions as joy and love to it.

**SOCIAL IDENTITY, ADOLESCENTS ACADEMIC COMPETENCE AND PROSOCIAL BEHAVIOUR IN CHINA, FRANCE AND THE UNITED KINGDOM**

Pamela Maras, Amy Moon, Nicole Gridley, Taveeshi Gupta

Across the three countries students’ self-reported pro-social behaviour was shown to positively relate to self-reported identity with school, peers and family, in addition to greater academic competence, academic effort and academic importance. In comparison antisocial behaviour was shown to have a negative relationship with these outcomes.

**THE DEVELOPMENT OF ALTRUISTIC PUNISHMENT**

Michaela Gummerum, Belen Lopez-Perez, Lotte van Dillen, Erik van Dijk
People’s interpersonal behavior is regulated by social and moral norms, and violations of these norms are often met with punishment. This project investigated the factors affecting children’s, adolescents’, and adults’ punishment of violators who violated prosocial and fairness norms by combining research in developmental psychology and experimental economics.

**DOES PUNISHMENT PROMOTE COOPERATION IN CHILDREN WITH HIGH-FUNCTIONING AUTISM**

*Jing Li, Liqi Zhu*

This study examined whether punishment could promote cooperation in children with high-functioning autism (HFA) and matched typically developing (TD) children. It was found that punishment promoted cooperation in prisoner’s dilemma game in TD children but not HFA children, and punishment was costly for both HFA and TD children.
IS048
SELF-ENHANCEMENT/SELF-ESTEEM AND MODESTY ACROSS CULTURES

C18. Culture and society - Other

Convenor Susumu Yamaguchi, University of Tokyo, Tokyo - Japan
Presenters Ai Fukuzawa, University of Tokyo, Tokyo - Japan
Chihiro Kobayashi, Kobe College, Hyogo-ken - Japan
Huajian Cai, Chinese Academy of Sciences, Beijing - China
Jenny Kurman, University of Haifa, Haifa - Israel
Susumu Yamaguchi, University of Tokyo, Tokyo – Japan

There have been controversies over East Asians’ self-enhancement motivation. Because norm of modesty is prevalent in East Asian cultures, self-enhancement motivation among people in East Asia may well be hidden in their modest appearances. To reveal real intention among East Asians (as compared to Westerners), which is often hidden beneath their modest behaviors, the present symposium presents neurological evidence as well as that obtained by traditional methods. Taken together, as will be presented, the evidence points to the generality of self-enhancement motivation among East Asians.

A NEURO-CULTURAL PERSPECTIVE ON SELF-ENHANCEMENT
Jenny Kurman, Rotem Perlmuter, and Simone Shamay-Tsoory
The overarching goal of the presented studies is to understand the mechanisms by which culture influences self-enhancement, using both behavioral methods and techniques from neuroscience. Study 1 (N=120; Korea, Japan, Israel) compares self-enhancement level using self-evaluation in narrow and broad traits among three cultural groups and shows an interaction between culture and type of trait. Study 2 (N = 30) uses a fMRI paradigm and demonstrate greater activation of the DLPFC (a region whose activation is associated with norm compliance) and the dACC (a region associated with inhibition) during the trait rating task for South Koreans compared to Israelis, supporting the notion that cultural restrictions and inhibition are more active among Koreans than Israelis during a self-evaluation process.

PAN-CULTURAL SELF-POSITIVITY: AN ERP STUDY OF SELF-REFERENCE JUDGMENTS
Huajian Cai, Lili Wu, Yuanyuan Shi, and Ruolei Gu
Whether persons across cultures are motivated to pursue a positive self has been hotly debated. All studies, however, have only investigated behavioral indexes. In this study, we had participants from China and Western nations to judge whether a series of positive or negative traits described themselves or not and recorded the electroencephalogram (EEG) at the meantime. Behavioral data showed that regardless of from China or from Western nations, participants responded faster to positive traits describing self than those not describing self but slower to negative traits describing self than those not describing self, and endorsed more positive traits describing self than those not describing self but deny more negative traits describing self than those not describing self, suggesting pan-cultural self-positivity. The neural data showed that this self-positivity manifested on both LPP and P300 for Chinese but merely on LPP for Westerners, providing neural evidence for both
similarities and dissimilarities of the manifestation of self-positivity. Together, both behavioral and neural evidence suggest not only a pan-cultural self-positivity but also the subtlety and dynamics of self-regulation in Chinese self-enhancement.

**RELATIONSHIP OF SELF-ENHANCEMENT OF ACADEMIC AND INTERPERSONAL-RELATIONSHIP DOMAIN AND PSYCHOLOGICAL WELL-BEING IN JAPANESE HIGH SCHOOL STUDENTS.**

*Chihiro Kobayashi*

In the present research, we asked several measures of psychological well-being (DV) and (a) evaluation of past results and (b) expectation of future results, in both academic and interpersonal domain (IV), to 392 high-school students in Japan. Measures of psychological well-being included; Rosenberg Self-Esteem Scale, Satisfaction to Life Scale (Kadono, 1994), and Psychological Well-Being Scale (Ryff, 1989). Evaluation of past results asked Ps, how satisfied they were about their past results (in academic and interpersonal relationships, respectively), and expectation of future results (e.g., “I imagine myself getting good results”) in academic and interpersonal relationships, were taken from Norem (2001). Results revealed that (1) Ps showed strong modesty in self-evaluating their past results in academic area, whereas they showed self-enhancement in evaluating their past results in interpersonal area. Also, (2) the positivity of interpersonal self-evaluation had stronger influence towards psychological well-being than that of academic self-evaluation. Implication of these results will be discussed.

**RELATIONS AMONG TWO TYPES OF PESSIMISM AND ACHIEVEMENT MOTIVATION - A CROSS-CULTURAL STUDY AMONG JAPANESE AND AMERICANS**

*Ai Fukuzawa*

This study examined relations between pessimism and achievement motivation among Japanese and American students. Specifically, the aim of this study was to find a way to maintain achievement motivation without sacrificing psychological well-being among Japanese students (relative to Americans). Results indicated that, among Japanese, external pessimism (i.e., pessimism about external factors), not internal pessimism, was positively related to achievement motivation. In addition, among Japanese, external pessimism did not damage their psychological well-being even after negative academic events in daily life. These results suggest that pessimistic views for external factors are useful for maintaining achievement motivation while keeping positive psychological well-being.

**MOTIVATIONS UNDERLYING MODESTY AMONG JAPANESE**

*Susumu Yamaguchi, Hiroaki Morio, and Fumio Murakami*

We hypothesized that Japanese are motivated to maintain positive evaluation by others even when they show modesty, especially when it comes to important traits. To examine this hypothesis, Japanese undergraduate students were asked to imagine that they were praised by their family member/classmate and answer if and how they would show modesty as well as how they would feel when they show modesty. The results revealed that the Japanese participant does not want their counterpart to lower their evaluation about his/her competence. In all, the results point to the existence of self-enhancement motivation even when Japanese show modesty.
The publication of the DSM-5 represented an important moment of redefinition of transgender issues. The old psychiatric diagnosis Gender Identity Disorder (GID) has been subjected to many nosographic changes, being recalled Gender Dysphoria. Despite these changes and political movements aimed at depsychiatrizing such identities, psychiatric community decided to not remove the diagnosis from DSM, carrying on its medicalization. In the field of scientific research focused on gender variances, two different tendencies exist: the first one focused on clinical issues related to transgender identities, the second one focused on the complex dimensions related to social and internalized stigma and its effects on mental health. These tendencies are not opposed to each other. On the contrary, they are intersected in specific core points which the current symposium aims at highlighting.

GENDER VARIANT PEOPLE BETWEEN PATHOLOGIZATION, SOCIAL STIGMA AND RESILIENCE

*Paolo Valerio, Cristiano Scandurra*

This contribution will provide a general overview of the actual socio-political condition lived by gender variant people, in particular embracing the psychological effects of gender prejudice and anti-transgender violence on mental health and wellbeing and the resilience strategies they may use to cope with.

TRANSGENDER SUBJECTIVITY, BECOMING AND METISSAGE AS METAPHORS

*Denise Medico*

In this presentation, basing on qualitative research and clinical experience, the author will share her understanding of transgender subjectivity which contrast with dominant clinical models. Mixing grounded theory and reflexivity, some reflections coming from 15 in-depth interviews addressed to MtF transgender people will be presented.

AN APPLICATION OF THE IMPLICIT ASSOCIATION TEST (IAT) TO THE ASSESSMENT OF GENDER IDENTITY IN TRANSSEXUALS

*Antonio Prunas*

This research project aims at testing the clinical utility of the Implicit Association Test-Gender Identity (IAT-GI, Greenwald et al, 1998) in the assessment of gender identity, focusing primarily on its convergence with explicit measure of gender identity, gender dysphoria and sex roles and its
capacity to discriminate among different groups according to gender identification and regardless of biological sex and sexual orientation

BEING TRANS IN BRAZIL: DISCRIMINATION AND HEALTHCARE
Angelo Brandelli Costa, Henrique Caetano Nardi, Silvia Koller
This presentation aims to discuss a survey that investigated the health vulnerability of Brazilian transgender persons. Specifically, will be presented data regarding HIV infection in trans women comparing samples of two states that have distinct epidemic profiles: São Paulo and Rio Grande do Sul. Data on health vulnerability in trans men and gender non-conforming persons will also be presented.
For years, public policies, in Italy and in Europe, have been cutting funds to social prevention and consequently a lot of professional services performed by Psychologists have been reduced or deleted. These policies, while allowing a saving immediately, then oblige public administrations to spend a lot more to intervene in situations that become, over time, emergencies and needs, sometimes dramatic. Aware of the overall condition of the economy in the Italian and European context, ENPAP - the body in charge of the social welfare and pensions of the Italian Psychologists - wants to give its contribution to address this situation and to support both the income and the working continuity for Psychologists. The idea is to invest a part of the collected savings in social prevention projects involving Psychologists that entail social and economic benefits (for example, in terms of cost savings) for the welfare state, ensuring, at the same time, the future of Psychologists pensions. Supporting the national welfare system through projects involving Psychologists on the territory can reactivate the virtuous cycle of prevention, put at the heart of prevention activities the professional competence of Psychologists, improve the life quality of citizens and support the development of the country. We have identified in the Social Impact Bond (SIB) developed in the UK, a highly interesting tool to pursue this goal. We are therefore working to develop, also in Italy, a similar financial mechanism able to draw social and economic impact investments thanks to the direct involvement of professional Psychologists. During the Symposium we will focus on the evolution of the project, the evaluation models of social and budgetary impacts that support it, the reflections and the experiences in progress in Europe activated through the same principles.
A ROADMAP TO SOCIAL IMPACT INVESTING
Lucia Martina
Effectiveness in achieving results and impact measurement are the key words at the base of Social Impact Bonds. The intervention will highlight the developments taking place in philanthropy and social investing to envision the available options to go beyond grants in order to create relevant outcomes for the community in a more sustainable way.

EFFECTIVENESS AND CHALLENGES OF WORKING AS A PSYCHOLOGIST IN PREVENTION PROGRAMS: CLOSING THE GAP BETWEEN RESEARCH AND PRACTICE
Massimo Santinello
There is increasing evidence about the effectiveness of preventive programs and strategies in relation to mental health problems (e.g., for depression, smoking, alcohol abuse, etc.). Moreover, empirical data show the economic impact (e.g., in terms of cost-effectiveness analysis) of using a preventive approach for some specific problems. Implications about the lack of these strategies in Italy are discussed.
Symposia

IS051

THE ART OF RESPONSIBLE CHANGE
CREATING AND USING A COMMUNITY PATTERN LANGUAGE FOR SOCIETAL CHANGE

F01. EXPO 2015 Hot Topics - Capacities building and human development
C05. Culture and society - Group processes and intergroup relations

Convenor Wolfgang Stark, University of Duisburg-Essen, Essen - Germany
Presenters Caterina Arcidiacono, University of Naples Federico II, Naples - Italy
Jacqui Akhurst, Rhodes University, Grahamstown - South Africa
Serdar M. Değirmencioğlu, Dogus University, Istanbul - Turkey
Wolfgang Stark, University of Duisburg-Essen, Essen – Germany
Discussant Bruna Zani, Alma Mater Studiorum - University of Bologna, Bologna - Italy

Psychological, social and natural science all have brought many insights about current problems in society (like climate change, social (in)justice, unfair distribution of resources and lack of community building). But our knowledge does not seem to guide our action. We are used to follow strategic plans to cope with market dynamics and to guide our action on a rational and scientific secure basis. At the same time, we know about the pitfalls of rational and economy-based planning: based on our recent experience of technological or financial crises, we realize that we have to adapt to a faster growing complexity which exceeds our human capabilities. This is why there is an urgent need to cope with uncertainties and ambiguities beyond control and helplessness – to move toward the ability to create responsible change.

This symposium therefore will stress the challenge how our insights can be inspired not only by our rational brain, but to use the knowledge which is based on experience and tacit knowing (Polanyi, Gigerenzer) of the many and on mindfulness, community building, creativity and art: How can we create awareness on systemic interdependencies we are living in based on the unconscious patterns of everyday wisdom? How can we use the wisdom of artistic processes in order to design societal change based on cooperation and creativity instead of competition and greed.

The symposium will bring together researchers and practitioners from diverse disciplines in order to create a transdisciplinary approach to societal challenges.

TACIT KNOWING AND THE COMMUNITY - A KEY FOR COMMUNITY CHANGE?
TOWARDS A PATTERN LANGUAGE FOR MODELS OF CHANGE IN COMMUNITY PSYCHOLOGY

Kora Kristof, Wolfgang Stark

Psychology most often restricts itself to research interventions on the individual or meso-level. One of the keys for change is to link individual, meso- and macro-levels in order to identify patterns and models for change at all levels. Therefore, psychology needs to take into account political, sociological and psychological sources, but also art-based sources of transformation dynamics in communities and social systems and realize that in complex systems a multidisciplinary approach always is needed.

Patterns of tacit knowing are frequently used to make things work in communities and organizations. Experienced-based "implicit wisdom" (Dewey, Polanyi) or "deep smarts" (Leonard), although being crucial for successful change, most often are not recognized in practice or are accepted for theory and research.

144
Based on the work of Christopher Alexander and own research we developed a system of "pattern mining and generating" to identify implicit wisdom in communities and organizations. In order to systematically develop a "pattern language and models for change" which can be used to introduce successful change processes, we use both qualitative and art-based research tools to identify strengths and to evaluate change in communities and organizations. We will show how patterns of implicit knowing can be discovered and identified in community psychology using art-based approaches; and how they can be systematized within „pattern languages“ and „models of change“.

“I NOW SEE THE WORLD DIFFERENTLY…”
WHAT CAN WE LEARN FROM PARTICIPATORY ARTS PROJECTS
Jacqui Akhurst (York St John University, UK), Carolyn Kagan (Manchester Metropolitan University, UK)
The use of arts activities as a tool for engagement, community development and community psychology praxis has been growing. We will reflect critically on some projects in which we have been involved, and draw on participants’ experiences to show that involvement in arts activities contributes to the development of new constructs around the self and the ‘other’; enhancement of self-confidence; and motivation for action. We will draw on project case studies to illustrate some of the different ways in which new meanings about life have been found, linked to the creative activities. The mechanisms, through which personal and thereafter societal transformations take place, include collaboration, cooperation, egalitarian relationships, the development of shared values and goals, and fun. However, participants also importantly gain insight into themselves and their positions in the world, and report the value of creating of communities of practice, involving those with different perspectives. The implications of what we have learnt from these different projects for a community pattern language will be highlighted.

PSYCHOLOGY AT THE BORDER BETWEEN INDIVIDUAL, RELATIONAL AND SOCIAL FACTORS
Caterina Arcidiacono (University Federico II, Napoli, Italy), Fortuna Procentese (University Federico II, Napoli, Italy)
Individual and social well being is influenced by social and relational circumstances as well as individual aspects. A simplified interpretation of social issues will focus only on the effects of social facts on wellbeing (i.e employment, inequality, environment, democracy); but a psychological perspective will be able to understand the role played by representation, attribution, and cognitive as well as unconscious and symbolic meanings. Therefore community psychology, as discipline strongly rooted in an ecological background, has tool to discover and explain how all these different dimensions interact. In this respect, psychology is the discipline that takes into consideration social variables related to individual and social historical backgrounds, as well as social organization considering power issues and social organization in the form they are perceived and assumed by individuals and groups. This discipline, considers then all relational determinants affecting individual live allowing to understand how people feel and represent what is happening in their life an in their environment. So far as we use a psychological approach we can understand social interactions in all their explicit and tacit dimensions. Psychologists are then professional able to drive and follow process of social change. On these ground the psychological approach to social issues is able to understand them in all their aspects and therefore psychologists are needed in social planning, urban development, and social regeneration.

RESPONSIBLE CHANGE UNDER IRRESPONSIBLE REGIMES: FOCUS ON YOUNG PEOPLE
Serdar M. Değirmencioğlu (Dogus University, Istanbul, Turkey)
It is hard to imagine how responsible change can be realized as fiscal austerity is imposed on millions...
as “a natural state of affairs”. It is certainly a huge challenge to achieve responsible change when governments are becoming increasingly irresponsible. To put it bluntly, how can positive societal change be achieved under neoliberal capitalism? It is important to begin with the notion of “public interest” so as to emphasize the fact that so long as “private” dominates “public”, no responsible change is possible. Secondly, it is necessary to identify power differentials and who is hit the hardest by neoliberal policies. This exercise quickly reveals those who are excluded or pushed to the margins. Thirdly, it is necessary to pinpoint the linkages between “public interest” and the necessity of community building in daily life. Next, it is essential to revive the often implicit notion of community power – how various individuals can contribute to community change. This is particularly important when the public services are pushed to conform “market rules” and those who are excluded or marginalized are blamed as “social parasites.” Finally, it is important to apply this model particularly to young people, who are marginalized through schooling, adultism and conventional democracy. Two cases are presented to illustrate how this approach can foster cooperation and creativity in daily life.
IS052
IN MEMORY OF PROFESSOR GIUSEPPE COSTANTINO - TEMAS TEST ASSESSMENT OF CHILDREN/ADOLESCENTS IN MULTICULTURAL SOCIETIES

E03. Health and clinical intervention - Personality assessment

Convenor  Gian Marco Sardi, S.I.P.Si.Vi, Cuneo - Italy
Presenters  Carolina Meucci, John Cabot University, Rome - Italy
  Daniel Dupertuis, Universidad Abierta Interamericana, Buenos Aires - Argentina
  Elsa Cardalda, Ponce Medical School and Health Sciences, Ponce - Puerto Rico
  Erminia Costantino on behalf of Giuseppe Costantino, American Multicultural Institute, New York - United States
  Gian Marco Sardi, S.I.P.Si.Vi, Cuneo - Italy
  Leib Litman, Touro College & University System, New York - United States
  Vito Tummino, President of FISSP (Italian Federation of Societies of Psychology)

Reporting of the standardizations of the minority and nonminority versions of the TEMAS (tell-Me-A-Story) Multicultural test in the U.S.A, the Jewish TEMAS, the Latin-American versions in Puerto Rico and Argentina, and the Romanian TEMAS version. The TEMAS presents several different variables, the use of chromatic pictures, bipolarities of the cards, contemporary settings and familiar themes, the use of a problem-solving scoring system, and normative standardizations for several international groups. The TEMAS was first published in the USA as the sole multicultural narrative test, normed with Black, Puerto Rican, Other Hispanic, and White groups to address the emic and etic validity in assessing minority and nonminority children/adolescents. Research indicates that the TEMAS is a valid instrument for the assessment of culturally diverse children in the USA and other countries. Objectives are to report on the development of the TEMAS for assessment of multicultural children, international validation of its clinical utility, and TEMAS dissemination in the USA and in other countries.

Giuseppe Costantino, Erminia Costantino, Carolina Meucci, Elsa Cardalda, Gian Marco Sardi

The development of TEMAS in the USA was to address the emic and etic validity in constructing a psychometrically sound multicultural narrative test for children/adolescents. The TEMAS was standardized on 650 youngsters aged 5 to 13 and normed on: Black, Puerto Rican, Other Hispanic, and White. There are two parallel versions: minority and nonminority and two forms, the short with 9 cards and: the long with 23 cards. The test assesses cognitive, personality and affective functions and is scored objectively. Numerous studies have shown that the TEMAS test presents concurrent and predictive validity in the assessment of culturally diverse children/adolescents.

COMPARISON OF THE TAT, CAT AND TEMAS TESTS IN ASSESSING HISPANIC CHILDREN

Elsa Cardalda

This study assessed the differential validity of the Thematic Apperception Test, Child Apperception Test and the TEMAS (Tell-Me-A-Story) Test in assessing personality of 122 school-age Puerto Rican
children in Puerto Rico. The three tests individually administered. The study used qualitative analyses in assessing the thematic content and quantitative analyses in assessing fluency of the stories. Findings indicated that the TEMAS protocols were more complete and extensive, than those of the TAT and CAT; thus supporting the clinical utility of TEMAS in assessing culturally diverse youngsters.

VALIDATION OF THE JEWISH TEMAS TEST
Giuseppe Costantino LeibLitman, Richard Waxman, CheskieRosenzweig, YairMaman Dan Sharir, and Elizabete Santos
In 2011 there were 6.588 million Jews in the USA, with 1.6 million living in New York City increasing 9% in the last 10 years; with also a 20% poverty level growth. This poverty rate places Jewish children at risk of mental health problems like other minority children. The Jewish TEMAS was developed as a culturally oriented test and validated in two preliminary studies. The results of the first study, using 60 undergraduate College Jewish students, showed that J-TEMAS cards were more relevant to Jewish culture than the American cards. The results of the second study, using 110 Jewish children showed that the card's relevance was associated with clinically meaningful stories where English language transitioned to Hebrew. The results indicated that the theoretical framework and the new pictures were valid for the Jewish population.

VALIDATION OF THE TEMAS TEST IN ARGENTINA
Daniel Dupertuis, Ernesto Pais, Guadalupe Forti
Argentina has 42 million people, of which 95% are White and 25% are under the age of 14. Additionally, it has a high utilization of psychological services and a high number of psychologists. The TEMAS is standardized in order to provide a more valid assessment than the TAT and CAT tests. A total of 320 boys and girls, ages 6 to 13 are used. Preliminary results indicated that several pictures needed to be redesigned in order to be more culturally relevant. In addition, comparison of the tested Argentenian children were more similar to the White normative children of the American version in cognitive, affective and personality functions than the normative Hispanic children.

UTILITY OF TEMAS TEST IN ASSESSING ABUSED CHILDREN IN ROMANIA
Gabriela Marc
Romania has one of the highest numbers of children living in placement centers and foster care of all nations in Eastern Europe. The literature indicates that these children suffer child abuse and child neglect. This study used the TEMAS test to assess 80 children in placement centers and 40 children living in intact homes. Results indicated that placement children showed poorer interpersonal relations, higher anxiety/depression and aggression, and lower self-esteem and sexual identity than children living in intact home, thus indicating a valid clinical utility of the TEMAS test.
IS053
PSYCHOLOGICAL CONDITIONS OF HUMAN ACHIEVEMENTS

B02. Development and education - School adjustment, academic achievement and learning disabilities

Convenor
Andrzej Sękowski, The John Paul II Catholic University of Lublin, Lublin - Poland

Presenters
Andrzej Sękowski, The John Paul II Catholic University of Lublin, Lublin - Poland
Anna Hawrot, Educational Research Institute, Warsaw - Poland
Ewa Czerniawska, University of Warsaw, Warsaw - Poland
Maria Ledzińska, University of Warsaw, Warsaw - Poland
Roberta Renati, Phronesis Centre for Potential Development & Resilience Nurturing - Eris Foundation, Milan - Italy
Sławomir Postek, University of Warsaw, Warsaw - Poland
Steven Pfeiffer, Florida State University, Tallahassee - United States

Discussant
Ewa Czerniawska, University of Warsaw, Warsaw - Poland

The symposium deals with the problems of human achievement. Achievements constitute one of the most important motifs of human activity. They are connected with the intellectual as well as the motivational-and-emotional spheres of human personality and are thus related, among others, to human giftedness, motivation, the value system, and self-esteem. The area in which an individual achieves and the level of achievement are conditioned both by personality traits as well as the environment in which one grows up. During the symposium, results of research will be presented concerning both gifted students as well as adults who have been successful in various areas of activity, including managerial positions. A person's achievements are associated with the period of life he or she is in. At school, achievement is often related to learning activity. Achievements of adults are often associated with professional activity. Symposium speakers pay special attention to individuals with outstanding achievements at school and work. The papers discuss research on personality-related determinants of outstanding achievements. An analysis of outstanding achievements shows the particular importance of achievement motivation, analytical, creative and practical intelligence, as well as metacognitive abilities. The key issues of the symposium are connected with the psychology of giftedness and the psychology of individual differences. An analysis of the determinants of achievements of gifted persons shows a great variety of the ways in which they can become successful. Factors which reduce the level of achievements of gifted persons will also be discussed. The importance of the area of achievement will be highlighted. Academic and professional achievements have different determinants. The symposium has an international character and it will feature studies of gifted persons conducted in Europe and the USA.

HUMAN ACHIEVEMENT AS A SUBJECT OF PSYCHOLOGICAL RESEARCH
Andrzej Sękowski

The article presents results of research on psychological determinants of human achievement. A conception of psychological determinants of outstanding human achievement, taking into account both the intellectual and motivational spheres including life goals and the environment, is discussed against the background of the presented research.

PATTERNS OF OUT-OF-SCHOOL SUPPORT IN LEARNING SCHOOL SUBJECTS
Anna Hawrot, Ewa Czerniawska
The goal of the paper is to examine patterns of out-of-school support in learning school subjects and to verify the relationship between these patterns and school achievement. Analyses included data for over 5000 lower secondary school students from 291 classes and 150 schools collected over three years of schooling.

**TRAJECTORIES OF WELL-BEING IN GIFTED CHILDREN. A RISK AND PROTECTIVE FACTORS PERSPECTIVE.**
Roberta Renati, Steven Pfeiffer
Gifted children have unique traits and needs. If these essentials are not supported, children may display social-emotional and behavioural problems that could affect their trajectories to positive well-being and achievement. The crucial role of emotional intelligence will be examined. Implications for intervention will be addressed.

**PSYCHOLOGICAL MECHANISM OF INFORMATION OVERLOAD IN HIGH RANKING MANAGERS – THEORETICAL MUSINGS AND VERY PRACTICAL IMPLICATIONS.**
Slawomir Postek, Maria Ledzińska
The talk covers the subject of psychological profiles of high achieving managers in relation to their main professional focus: processing information. A sample of 124 Polish high ranking managers was tested – the resulting holistic model of mediators and moderators of information stress will be presented and its practical implications discussed.
DECISION MAKING IN A LIFE-SPAN PERSPECTIVE

The ability to adapt oneself in an efficient and productive way to our daily social environment is an important challenge for humans, and this challenge is successfully met due to several fundamental processes that have developed throughout the evolution of our species. In this Symposium, we are particularly interested in decision making, i.e. the ability to process multiple alternatives and choose an optimal course of action to achieve the individuals’ goals in a given situation.

The theoretical perspective we adopt in this Symposium is a life-span one, in order to investigate the changes of decision making across ages and its possible relationships with other abilities or aspects of development.

The important psycho-social ability here considered in relation to decision making is Theory of Mind, i.e. the capacity to interpret behaviors in terms of mental states, analyzed in children and in the elderly (Presentations n. 1, 3, 4). The evidences obtained from behavioral experiments are discusses along with the evidences regarding the neural basis of decision making implied in complex strategic situations (Presentation n. 2).

“EASIER SAID THAN DONE”: THE SENSITIVITY TO A SOCIAL NORM OF FAIRNESS IN SCHOOL-AGED CHILDREN

Cristina Bicchieri

The sensitivity to fairness undergoes relevant changes in decision-making development. Bargaining games with Primary school-aged children allow to discover if they are sensible to a social norm of fairness and if they behave accordingly. Theory of Mind is also investigated, as it is involved in social interactions.

DECISION NEUROSCIENCE - NEW PERSPECTIVES ON SOCIAL CHOICE

Alan Sanfey

Decision Neuroscience utilizes novel approaches to the study of both individual and interactive decision-making by combining the methods of behavioral experiments, functional neuroimaging, and formal economic models. Examining sophisticated high-level behavior at a neural level can provide important clues to the mechanisms of decision-making.

DECISION MAKING AND THEORY OF MIND IN THE ELDERLY

Ilaria Castelli

The increase in life prospects and the on-going socio-economic level of our society changed our view of the aging process. It is important to understand the changes not only of physical and cognitive...
skills, but also of the socio-cognitive skills which contribute to the ability to interact with others, such as Theory of Mind and decision making.

**DECISION-MAKING AND LIES**  
*Barbara Colombo*  
In economic domain people are often required to make decisions by taking into account the perceived intentions of the partners. The aim of this study was to test how the perception that the responder is lying affects proposers’ offers in the Ultimatum Game. Results suggest that lie detection is crucial in economic decisions involving the interaction with other people and that visual behaviors, as well as other stylistic variables, play a mediating role.
According to Assor (2012), people's need for autonomy has two important components: (a) the striving to feel that one is free from control and pressure, and (b) the striving to feel that one has authentic, direction-giving, goals, values and interests. This latter component was termed by Assor (2012) Inner Compass (and see also Ryan, Deci & Vansteenkiste, 2015 on this concept). Research based on self determination theory (Ryan & Deci, 2000) has focused mainly on the first component, and only indirectly examined the internal compass component.

The present symposium includes three presentations exploring antecedents and consequences of adolescents' and young adults' experience of inner compass. The first presentation examines Chinese students' experience of their mother as: (1) validating their inner compass, and (2) providing optional choice and being non-controlling, as two unique predictors of positive relationships with mother. Results support the proposed two-component view of the need for autonomy. The second presentation replicates the findings obtained with Chinese students with Jewish Israeli students, thus suggesting that the proposed two-component view of the need for autonomy may be valid across very different cultures. This presentation also explores the role identification with mother's values as a predictor of the experience of having an inner compass. The last presentation focuses on the socializing practice of Inherent Value Demonstration (IVD): demonstrating the socializing agent's values in behaviour and showing that the agent feels content while engaged in the behaviour. It was found that IVD contributes to adolescents' identification with parents' values; and thereby possibly contributing to the formation of a firm inner compass and a concomitant sense of autonomy.

Discussion will examine the proposed two-component view of the need for autonomy and a number of related issues. For example: Are there under-explored aspects of parenting behaviour that may support the formation of an inner compass in adolescents and young adults? We will focus on three such aspects: Inner value demonstration, Fostering Inner Valuing, Supporting value exploration, and parent's intrinsic values.
According to Assor (2012), in order for people to feel that their need for autonomy is satisfied they need to feel that: (a) they have an internal compass - authentic, direction-giving, values, goals and interests, and (b) they have optional choice and are not pressured or controlled. When close others are perceived to support both aspects of the need for autonomy one is likely to feel autonomously motivated to spend time with them, which in turn is likely to enhance feelings of vitality when being around these people. While the contribution of the optional choice aspect of need for autonomy was demonstrated in many studies guided by self determination theory (Ryan and Deci, 2000), no research to-date has examined the effects of the experience of having an inner compass. Regression analysis of data collected among 72 Chinese college-age students supported this view. Thus, students’ perception of maternal ICV predicted their vitality when being with mother, and this relationship was fully mediated by e autonomous motivation to spend time with mom. Path analysis also showed both ICV and the experience of mother as providing choice and not controlling uniquely predicted motivation to be with mother. Moreover, ICV predicted motivation to be with mother even after controlling for the choice-vs-control aspect of need autonomy satisfaction; thus supporting our conceptualization of IC as a distinctive, independent component of the need for autonomy.

REPLICATIONS AND FURTHER EXPLORATIONS OF THE EXPERIENCE OF HAVING AN INNER COMPASS: CONSEQUENCES AND ANTECEDENTS.
Ohad Ezra and Avi Assor
Two studies were conducted to replicate and extend findings concerning the experience of having an inner compass. Study 1 attempted to replicate the results obtained by Yu Shi (first presentation) in a rather different, less hierarchical and less collective cultural group: Jewish college students in Israel. Results of regression analysis and path analysis conducted on a sample of 140 college students were very similar to those obtained by Yu Shi with Chinese students although as can be expected, Israeli students perceived their mothers as higher on both inner compass validation and provision of optional choice and low control. Thus, despite expected mean differences, it appears that there is cross-cultural support for the two component of need for autonomy.
Study 2 examined the contribution of students' adoption of maternal values to the formation of a sense of having an inner compass; that is to the experience of having authentic, direction-giving, values and goals. As expected students' who reported having values similar to those of their mother also reported a strong sense of inner compass to the extent that they felt autonomously motivated to adopt their mother's values. In addition, holding intrinsic rather than extrinsic aspirations (Ryan, Sheldon, Kasser & Deci, 1996) also contributed to having a firm sense of inner compass.
Taken together these studies further contribute to our understanding of the experience of having an inner compass, its antecedents and consequences.

YOUTHS’ RELIGIOUS INTERNALIZATION AS A RESULT OF ADULTS’ BEHAVIORS: THE ROLE OF BASIC AUTONOMY SUPPORT AND INTRINSIC VALUE DEMONSTRATION
Maria Brambilla
It is possible to distinguish between at least two types of internalization of religion, called identification and introjection (Ryan, Rigby & King, 1993), which differ in the degree of sense of autonomy associated with the endorsement of religious values and practices: introjection is associated with pressures to conform or with sense of unease, conflict and pressure, whereas identification is experienced as more autonomous. We hypothesized that youths’ religious internalization can be predicted by different adults’ behaviours, in particular Basic Autonomy Support (BAS, e.g. allowing children to choose between different options and taking the child's perspective) and Intrinsic Value Demonstration (IVD, e.g. adults' behavior demonstrating the value they endorse, that is accompanied by a sense of satisfaction and growth, thus demonstrating the inherent value of the behaviour). A study with Italian Catholic youths investigated the role of BAS and IVD in affecting youths’ religious internalization, considering both the context of family and group relations. Results show that BAS and
IVD provided by parents, religious leaders and peers both positively predict religious identification and not introjection. The role of IVD and identification with adults' values in promoting adolescents’ sense of inner compass will be discussed.
Most studies in developmental and in cognitive psychology have used the mean performance as an indicator of the individuals’ functioning. This almost exclusive emphasis on the mean, despite numerous warnings over the years that individual variability has to be considered a fundamental phenomenon, has led to the belief that fluctuations in behavior and heterogeneity across tasks are a marker of dysfunctioning. A number of studies, in particular in the field of healthy and of pathological cognitive aging, have now demonstrated that intra-individual variability (defined as short-term within-task fluctuations, or across time or tasks) provides a complementary information to that provided by the mean. It might even constitute a reliable indicator of later cognitive dysfunctioning. Yet, studies are still scarce, and a number of questions remain open, among which: while developmental differences in variability have been rather convincingly demonstrated as concerns response times in experimental tasks, it seems more difficult to observe them in terms of precision or accuracy scores; also, there is no agreement reached yet on the best way to measure and model variability; or how does behavioral variability relate to brain or other types of physiological (e.g., cardiac) variability.

The present symposium will address some of those issues. MacDonald and coll. review the various types of variability that have been operationalized so far and discuss their relevance in the context of aging. Schmiedek and coll. illustrate the use of diffusion modeling to disentangle various processes underlying the increase in response times and in their variability in older adulthood. Garrett focuses on the intriguing finding that brain variability follows an inverse developmental curve relative to that of behavior variability. Mella and coll. illustrate the very large interindividual differences in...
intraindividual change on the basis of findings from a longitudinal study. Kliegel and coll. present first empirical evidence about variability in prospective memory, which might raise some particular methodological difficulties while obviously relevant for everyday memory. Finally, Borella and coll. address the relevance of the study of variability for our understanding of developmental disorders in children such as ADHD or dyslexia. If time allows, a discussion will take place among the contributors to this symposium.

‘VARIABILITY’ IN DEFINITIONS OF INTRAINDIVIDUAL VARIABILITY: COMPARISONS AND IMPLICATIONS
Stuart W.S. MacDonald, & Robert S. Stawski
Numerous definitions of response time variability are employed, with few studies comparing competing operationalizations. We employ data from measurement burst studies to compare common variability definitions. Discussion will focus on the implications of competing variability operationalizations for improving our understanding of cognitive aging.

DIFFUSION MODEL ANALYSES OF INDIVIDUAL AND AGE-RELATED DIFFERENCES AND PRACTICE-RELATED CHANGES IN CHOICE REACTION TASKS
F. Schmiedek, Roger Ratcliff, Martin Lövdén, & U. Lindenberger
With data from 101 younger and 103 older adults who practiced three choice-reaction tasks in 100 sessions, the use of diffusion modeling to understand individual and age-related differences as well as practice-related changes in different aspects of performance, like means and intraindividual standard deviations of reaction time, is demonstrated.

WHEN “NOISE” BECOMES “SIGNAL” IN THE STUDY OF HUMAN AGING AND COGNITION
Douglas D. Garrett
Healthy brains are highly dynamic across moments, and these dynamics often reduce with aging. Our work suggests that, contrary to traditional theoretical expectations of adult-developmental increases in "neural noise," brain aging could instead be re-conceived of as a generalized process of increasing system rigidity and loss of dynamic range.

CHANGES IN INTRAINDIVIDUAL VARIABILITY WITH AGING
Nathalie Mella, Delphine Fagot, & Anik de Ribaupierre
Within-individual changes in older adults in both mean level of performance and intraindividual variability were analyzed, using bootstrap analyses, in a longitudinal study over a period of 4-5 years. Results showed little systematic change and large inter-individual differences in intraindividual change and in intraindividual variability.

EXPLORING VARIABILITY IN EVERYDAY-RELEVANT MEMORY FUNCTIONS ACROSS ADULTHOOD
Matthias Kliegel, Andreas Ihle, & Paolo Ghisletta
One of the most frequent everyday memory tasks is to remember to execute delayed intentions (e.g., taking medication in time). The processes underlying this goal-directed behavior have been termed prospective memory. The present talk will present first systematic studies exploring variability in this everyday-relevant memory function in young and older adults.

INTRAINDIVIDUAL VARIABILITY IN DEVELOPMENTAL DISABILITIES.
Erika Borella, Christian Chicherio, Anna Maria Re, & Cesare Cornoldi

The aim of this presentation is to illustrate and discuss the contribution of intraindividual variability (IIV) in understanding developmental disabilities, with a special focus on Attention-Deficit Hyperactivity Disorder and dyslexia. IIV in cognitive measures and skills directly related with school learning in such disabilities will be considered.
IS057
AGGRESSION AND VIOLENCE ACROSS CONTEXTS AND COUNTRIES

B05. Development and education - Moral development and prosocial behavior

Convenor        John Tisak, Bowling Green State University, Bowling Green - United States
Presenters       Ersilia Menesini, University of Florence, Florence - Italy
                  Georges Steffgen, University of Luxembourg, Walferdange - Luxembourg
                  Guido Alessandri, Sapienza University of Rome, Rome - Italy
                  Marie S. Tisak, Bowling Green State University, Bowling Green - United States

Aggression and violence has been a very important study in the lives of children and young adults across different countries or cultures. There are numerous journals and international conferences devoted to this theme. In this symposium, we chose to include top and respected researchers from different countries who have contributed to the understanding of aggression and violence. Therefore, the main presenters are from Italy, Luxembourg, and the United States. However, the research they present extends beyond these countries. Furthermore, each focus on a different context with aggression and violence. In the first presentation, Tisak et al., will focus on elements, which may influence aggressive behaviors among youth offenders, including prior exposure as a victim, prior own aggressive behavior (via personal reports and official arrest records) and parental factors. The second presentation, by Alessandri et al., integrates aggression and prosocial behavior by examining short term influences between bullies and those who are altruistic. In their longitudinal study they were able to use the ATL statistical model to separate effects that are state like (variable) to those that are stable (trait-like). The third presentation by Steffgen compares who students in two different countries, Luxemburg and Germany cope with cyberbullying in different bystander roles, such as assistants, reinforcements, defenders, and outsiders. Menesini et al., in the 4th presentation will discuss findings of comparing adolescents’ perceptions of the seriousness as well as their definitions of bullying (face-to-face) and cyberbullying (online). The study consisted of a cross-cultural study across 5 countries (Italy, Germany, Estonia, Turkey, and Spain). An integrated discussion will follow.

PREDICTORS OF MODERATE AND SEVERE AGGRESSION AMONG ADOLESCENT OFFENDERS: THE INFLUENCE OF PRIOR EXPOSURE, PRIOR BEHAVIOR, AND PARENTAL FACTORS
Marie S. Tisak, John Tisak, Erin R. Baker, & Allison Kiefner-Burmeister
Two hundred and fifty-four adolescent offenders responded to how often they were a victim and/or instigator regarding aggression and violence. Views of how caring and how controlling their parent(s) were to them were also assessed. Based on their official arrest records, we examined whether childhood familial problems, facilitated a juvenile committing more crimes than juveniles with no past court interventions.

BULLIES AND ALTRUISTS UNDER THE LENS: UNDERSTANDING THE SHORT TERM RELATIONS BETWEEN AGGRESSION AND PROSOCIALITY
Guido Alessandri, Corrado Fagnani, & Michele Vecchione
A sample of 180 secondary school children (55% females), were assessed five times during two years, for disentangling the short term influences between aggression and prosociality. The ALT model allowed us to decompose the effects due to the state components of the variables, and those
attributable to their stable (i.e., like-trait”) components, while considering their developmental trajectories.

**COPING WITH CYBERBULLYING: A COMPARISON BETWEEN STUDENTS FROM LUXEMBURG AND GERMANY**

*Georges Steffgen*

This study explored how participants in cyberbullying incidents in Luxembourg (N = 150) and Germany (N = 212) differ in coping behavior. Students completed a questionnaire on participant role and coping. Coping behavior was classified into six strategies: productive other-focused strategies, productive self-focused strategies, nonproductive avoidance, relationships improvement, aggressive/assertive response, and technical response.

**BULLYING AND CYBERBULLYING DEFINITION AND PERCEPTION OF SERIOUSNESS: DIFFERENCES AND SIMILARITIES ACROSS COUNTRIES**

*Ersilia Menesini, Annalaura Nocentini, Benedetta Emanuela Palladino, Piret Luik, Karin Naruskov, Rosario Ortego, Juan Calmaestra, Herbert Scheithauer, Markus Hess, Anja Schultze-Krumbholz, Zehra Ucanok, & Aysun Dogan*

The aim of this study is to compare different perception of seriousness and definition of bullying and cyberbullying in face to face and online contexts. To this purpose a set of 32 scenarios were developed and used in a cross-cultural study across 5 countries (Italy, Germany, Estonia, Turkey and Spain) with adolescents between 12 and 15 years of age.
The main issue we would like to discuss during the symposium is - as the title suggests - positive orientation, which is understood as a stable disposition to evaluate oneself, one’s life and future in a positive way. Recent studies published by Caprara and his coworkers have revealed that some variables used widely in research on well-being – that is self-esteem, satisfaction with life and optimism – can be explained in a large degree by the higher-order factor, called positive orientation. Research show that the positive orientation, although in a large extent inherited, is a different construct than on the one hand personality traits, like for example the Big Five, and on the other hand consists on three mentioned above variables and significantly correlates with the others like generalized self-efficacy or positive affect. Thus we plan to organize symposium around the "positivity" factor to present some ideas and results on it. We would like to refer to a broader scope of variables describing positive or optimal functioning of the person. We are interested in research challenges as well as possible limitation of the model of positive orientation. Possible area of interest refer to a wide range of problems related to eudemonic and hedonic well-being, growth, happiness and others.

The paper aims at introducing three problems: (1) the structure of positive orientation, as constituted of meaning of life and self-esteem, optimism and life satisfaction; (2) correspondence between positive orientation and other variables describing well-being like generalized self-efficacy or love for life; (3) possible interpretations of positive orientation: its, origins, adaptive functions, and specificity.

The present prospective study examined the prediction of psychological exhaustion (ESA) from Positivity (POS) and Positive affect (PA) using weekly diaries kept by 228 undergraduate Italian psychology students. Results supported a model in which a psychological resource, Positivity,
positively predicted a psycho-physiological state (i.e., psychological exhaustion) indirectly through mediation by a component of mood (i.e., positive affect).

**POSITIVE ORIENTATION AND ADAPTIVE SELF**
*Tomasz Jankowski*

Presented study conducted with 200 participants verified hypotheses about significant relationship between Positive Orientation and an adaptive ‘core self’ (high self-concept clarity, low self-esteem contingency, low self-rumination). Results showed that PO is a strong predictor of the adaptive features of the self-concept, and that the self-concept clarity and rumination (but not self-esteem contingency) are significant mediators between positive orientation and hedonic balance.

**POSITIVE ORIENTATION MAY BE A STATE: THE ROLE OF THINKING ABOUT DISTANT FUTURE**
*Kinga Lachowicz-Tabaczek, Beata Bajcar*

Positive orientation is defined as a set of stable dispositions related to self-esteem, optimism and life satisfaction. In this paper we propose to broaden the concept of positive orientation by considering it not only as a dispositional construct but also as a state. We will present the results of studies which show that thinking about more distant future in comparison to thinking about closer future lead to an increase of self-esteem as a state, an improvement of positive mood and a growth of optimism concerning future self-appraisals. Additionally, these effects turn out to be significantly stronger among individuals with dispositional low self-esteem than in high self-esteem individuals. These results may suggest the existence of state positive orientation which could be developed even among people whose dispositional positive orientation is low.

**POSITIVITY AS A DEVELOPMENTAL PREDICTOR OF HAPPINESS**
*Michele Vecchione & Guido Alessandri*

The present study examined whether positivity, conceptualized as a pervasive mode of appraising, viewing, and perceiving life from a positive stance, predicts chronic positive affectivity across time or vice versa. Participants (263 participants [47% females]), were followed for eight years (from 15.5 years to 23.5 years). Longitudinal findings corroborated the posited paths of relations, with positivity significantly predicting positive affectivity across time rather than vice versa.

**THE CRITICAL ROLE OF THE NEGATIVE IN UNDERSTANDING OPTIMAL HUMAN FUNCTIONING**
*Carol Ryff*

This presentation will argue that optimal human functioning requires an integration of positive and negative psychological experience. The perspective will be illustrated with a model of psychological well-being that explicates how qualities such as purpose in life, personal growth, and self-acceptance frequently involve encounters with life challenges and adversity. Empirical examples from the literature on human resilience will be offered as an alternative to an exclusively positive orientation.
IS059
COUNSELING IN CLINICAL AND HEALTH PSYCHOLOGY

In this current era of evidence-based practice, the mental health disciplines of psychology, both on the side of psychotherapy both on the perspective of professional counseling, have embraced the competency movement and its culture of competency. Competence and competency are closely related terms: whereas some authors use the words interchangeably, others differentiate them wherein competence refers to the potential or capacity to perform and competency means the actual performance or demonstration of that capacity. Competence involves a broad spectrum of personal and professional capacities relative to a given external standard or requirement. Competence is also described as the habitual and judicious use of communication, knowledge, technical skills, clinical reasoning, emotions, values and reflection in daily practice for the benefit of the individual and the community. On the other hand, competency is the capacity to integrate knowledge, skills and attitudes reflected in the quality of clinical practice. An ongoing initiative of the American Psychological Association (APA) has been to shift professional training in psychology from a core curriculum model to a core competency model of learning. More specifically the National Council of Schools and Programs of Professional Psychology has developed a set of seven competencies for the professional practice of psychology: relationship, assessment, intervention, research and evaluation, consultation and education, management and supervision, and diversity. The principal objective of the present symposium is aimed both to delineate the structural professional characterization of counseling at formative level, both to describe, in the context of Clinical and Health Psychology, the fundamental role of this intervention on psychological well-being and quality of life (with focus on Learning Disabilities, Active Ageing, Narrative Methodology, University and Occupational Counseling).
with studies. The intervention used a narrative methodology, the Narrative Mediation Path (NMP), as a mediation tool for the promotion of mentalization functions.

LEARNING DISABILITIES & EUROPEAN UNIVERSITY WORLD: WORK IN PROGRESS
Sborlini I., Paoloni G., Sorgi K., Conti C., Orsucci F.
In the university field the psychological counseling to Specific Learning Difficulties is part of the range of services offered in order to strengthen skills and abilities of student development, through the activities of reception, guidance, mentoring and teaching mediation, promoting full inclusion and protection of equal opportunities for study.

THE ROLE OF THE CLINICAL-PSYCHOLOGICAL COUNSELING ON THE HEALTH OF UNIVERSITY STUDENTS
Rezzonico G., Bani M., Strepparava M.G.
University counseling service can be seen as a front-line service to detect and manage at an early stage mental health issues in young adults helping them in crucial turning points in lifespan development and to detect early psychopathological. This paper presents the effectiveness data of a university counseling service.

THE COUNSELING FUNCTION IN OCCUPATIONAL HEALTH
Sarchielli G., Di Fabio A., Sirigatti S.
The aim of the presentation is to examine counseling as a special professional function in the field of Clinical, Health and Occupational Psychology. This function involves different multidimensional competencies and professional activities and might become an important intervention area for scientist and practitioners also in Italy.
Despite cross-cutting multidisciplinary research and policy efforts in most European states it has not been possible to achieve significant changes in consumption and production which would reverse or slow down the devastating projections outlined by the Intergovernmental Panel on Climatic Change (IPCC) for the ecosystems. The role of Environmental Psychology in giving responses to some key societal challenges is becoming more widely recognized within the broader field of Environmental Sciences, providing both conceptual frameworks for the understanding of key aspects of global problems and methodologies for exploring the human-environment interactions. Considerable research funds have been dedicated to investigate the barriers to and drivers of transitions to sustainable societies and to define the processes and tools that would promote multi-level changes towards sustainability. It has long been recognized that for transitions to sustainable societies to be effective, it is necessary to tackle both consumption and production, and to conceptualize lifestyles as situated patterns of activities, in contexts such as workplaces, homes and communities.

The present symposium will explore the multiple research dimensions and determinants of sustainability transitions, as well as the main obstacles to achieving considerable greenhouse gas emissions reductions in areas such as energy consumption, waste generation and management or mobility. It will explore the psychological and social factors influencing (un)sustainable behaviors, and the utility of different tools for the definition and testing of pathways for the transformation of workplaces and communities, such as participatory scenario development tools, modeling and simulations. Within a multi-disciplinary framework, it will show how social science theory, modeling tools and multi-method empirical research can describe the conditions under which sustainable lifestyles can become the norm, rather than the exception.

A TEMPORAL AND SPATIAL APPROACH TO SUSTAINABLE LIFESTYLES
Adina Dumitru
Although embedded practices and lock-in systems account for part of the difficulty in tackling climate change, individual behavior still plays a key role in sustainable transitions. We will discuss an approach to lifestyles that considers the temporal and spatial dimensions of environmentally-relevant behavior and show how it can inform both research and policy.

SOCIAL DOMINANCE ORIENTATION, MINDFULNESS AND PRO-ENVIRONMENTAL BEHAVIOUR
Giuseppe Carrus, Fridanna Maricchiolo, Angelo Panno & Lucia Mannetti
Previous studies showed that Social Dominance Orientation (SDO) on the one hand, and Mindfulness, on the other hand, are related to environmentally relevant behaviors (ERB). In a correlational survey we test a mediation path from SDO to ERB, through mindfulness. Findings show that lower SDO is related to greater mindfulness, which in turn, is related to more ERB.

INTENT PLUS IMPACT IS NEEDED! IMPLICATIONS OF A TWOFOLD PERSPECTIVE ON SUSTAINABLE CONSUMPTION FOR PSYCHOLOGICAL INTERVENTION PROGRAMS

Ellen Matthies

Within the discourse of education for sustainable development a twofold definition of individual sustainable consumption is common, comprising intent and impact aspects of individual sustainable behaviors. We take up this definition and show that it is in accordance with the psychological knowledge about possible longterm and side effects of interventions in the domain of environmentally significant behavior.

BUILDING MODELS OF A SUSTAINABLE FUTURE: FROM STATISTICAL MODELLING TO SOCIAL SIMULATION OF ACTIVITY PATTERNS

Tony Craig

Basic and advanced statistical methods have, for a long time played a key role within the psychologist’s toolbox. We report here on some successful collaborations between environmental psychologists and computer scientists, and introduce some ideas from agent based modelling that can help in developing understanding of sustainability transitions.

THE ROLE OF IMPLICIT ATTITUDES IN SUSTAINABLE LIFESTYLE’S DEVELOPMENT

Irina Macsinga

People decision to develop a sustainable lifestyle is related to their goals, with beneficial effects for society. However, sometimes, there is an inconsistency between goals and behavior which creates an ambivalent attitude. Using indirect measures, the study aims to identify people implicit attitudes towards environmental issues, and based on the results, particular interventions are discussed.
IS061
EMOTIONAL EATING

F05. EXPO 2015 Hot topics – Eating disorders

Convenor Tatjana van Strien, Free University Amsterdam and Radboud University Nijmegen, Nijmegen - Netherlands

Presenters Aranka Dol, Hanzehogeschool Groningen, Groningen - Netherlands
Carmen Keller, ETH Zurich, Zurich - Switzerland
Hanna Konttinen, University of Helsinki, Helsinki - Finland
Laura Winkens, VU University, Amsterdam - Netherlands
Tatjana van Strien, Free University Amsterdam and Radboud University Nijmegen, Nijmegen – Netherlands

Discussant Tatjana van Strien, Free University Amsterdam and Radboud University Nijmegen, Nijmegen - Netherlands

Emotional eating is an evolutionary atypical stress response. Distress is normally associated with a hyperactive hypothalamic-pituitary adrenal axis (HPA-axis) with physiological reactions designed to prepare the individual for a fight or flight response, thereby suppressing feelings of hunger. The unnatural response of emotional is thought to be acquired as outcome of adverse rearing experiences early in life. These may have lasting effects on the HPA-axis resulting in a hypoactive instead of hyperactive HPA axis: increased food intake instead of the typical reduced food intake. There also may be problems with attachment, autonomy-connectedness and emotion regulation skills, in particular when perturbed mother-infant relationships are involved. Emotional eating is characterized by overeating in response to negative emotions with as outcome ‘Kummerspeck’: excess weight gained from emotional overeating.

In this symposium we present new results from experiments and (longitudinal) questionnaire studies. Carmen Keller (Zurich, Switzerland) presents new results of a large longitudinal Swiss study. Earlier she showed that emotional eating was a strong predictor of increased BMI one year later and that physical activity attenuated but not annulled this association. Hanna Konttinen (Helsinki, Finland) presents longitudinal results on emotional eating and depressive feelings. Earlier she showed that emotional eating was related to higher consumption of sweet foods and to lower physical activity self-efficacy. Laura Winkens (Amsterdam, the Netherlands) will present results on the question: Mindful eating, emotional eating and depressive symptoms: how are they linked? Tatjana van Strien (Nijmegen/Amsterdam, the Netherlands), explores eating in response to positive emotions in relation to overweight. Aranka Doll (Groningen, The Netherlands) will demonstrate an app for eHealth emotional eating treatment.

DETERMINANTS AND CONSEQUENCES OF EMOTIONAL EATING: RESULTS OF A FIVE-WAVE LONGITUDINAL STUDY
Carmen Keller, Christina Hartmann

We examine the influence of emotional eating on food choices and weight change in dependence of personality traits (e.g. neuroticism), body image and life events. A population-based study in Switzerland started in 2010 with yearly follow-up periods for five years (last wave in 2014, N=2880). Results will be presented in the symposium.
EMOTIONAL EATING AND DEPRESSIVE SYMPTOMS AS PREDICTORS OF 7-YEAR DIETARY AND BODY WEIGHT CHANGES
Hanna Konttinen, Satu Männistö & Ari Haukkala
The study aims to examine the interplay between emotional eating and depressive symptoms in influencing long-term dietary and body weight changes in a Finnish population-based sample (the DILGOM Study). Baseline took place in 2007 (N=5024) and follow-up is conducted in spring 2014. The outcomes of the research will be presented in the symposium.

MINDFUL EATING, EMOTIONAL EATING AND DEPRESSIVE SYMPTOMS
Laura Winkens, Tatjana van Strien, Liisa Lähteenmäki, Madeleine Broman Toft, Ingeborg Brouwer, Brenda Penninx, & Marjolein Visser
Mindful eating, emotional eating and depressive symptoms: how are they linked? In this presentation I will present first results from the European MooDFOOD project, namely those of a cross-sectional study in a Danish and Spanish sample.

POSITIVE VS NEGATIVE EMOTIONS/EMOTIONAL EATING AND OVERWEIGHT. IS ‘KUMMERSPECK’ A MISNOMER?
Tatjana van Strien (with Machteld A.Ouwens & Marianne Donker).
Positive emotions are a ‘neglected trigger for food intake’. Is eating in response to positive emotions also related to overweight? In other words, is ‘Kummerspeck’ a misnomer and must we also speak of ‘Jollyfat’? I address this question in two questionnaire studies and one experiment with actual food intake.

A GUIDED SELF HELP INTERNET INTERVENTION ON EMOTION REGULATION FOR OBESE EMOTIONAL EATERS
Aranka Dol
I will demonstrate a smartphone app developed to practise emotion regulation skills. This application is part of a 6-weeks Internet-based guided self-help intervention for obese high emotional eaters in a group setting. Development of the intervention is in co-creation with the targetgroup and based on an agile methodology.
IS062
THE FUNCTIONAL-COGNITIVE FRAMEWORK IN PSYCHOLOGY

A18. General issues and basic processes - Theoretical approaches

Convenor
Marco Perugini, University of Milan-Bicocca, Milan - Italy
Baptist Liefooghe, Ghent University, Ghent - Belgium
Jan De Houwer, Ghent University, Ghent - Belgium
Klaus Fiedler, Heidelberg University, Heidelberg - Germany
Marco Perugini, University of Milan-Bicocca, Milan - Italy
Sean Hughes, Ghent University, Ghent – Belgium

The aim of this symposium is to identify elements that functional psychology can offer to cognitive psychology, both as a general framework and with regard to a variety of topics such as cognitive control, evaluative learning, personality, and social psychology. The basic idea is that both approaches are not in competition because they operate at different levels of explanation. In fact, they might be mutually supportive, provided that there is a common language to communicate with each other. The symposium will include general talks on the details and merits of a Functional-Cognitive framework in Psychology as well as more specific talks that exemplify its practical application to relevant issues and domains.

INTRODUCING THE FUNCTIONAL-COGNITIVE FRAMEWORK
Jan De Houwer
Whereas functional psychologists explain behavior in terms of elements in the environment, cognitive psychologists explain the impact of environment on behavior in terms of mediating mental processes. In this presentation, I first argue that the functional and cognitive approach in psychology are mutually supportive. That is, functional psychologists can help cognitive psychologists to uncover mediating mental processes whereas cognitive psychologists can help functional researchers to identify new environment-behavior relations. In the second part of the presentation, I review a number of potential arguments for why functional and cognitive psychologist should not interact. I argue that these arguments are based on misunderstandings or can be circumvented.

A FUNCTIONAL TAXONOMY FOR RESEARCH ON COGNITIVE CONTROL
Baptist Liefooghe, Jan De Houwer
Cognitive control is an important mental ability that has led to the construction of a multitude of cognitive control tasks (CCTs) that measure effects, which are considered as proxies of mental processes. Although the use of CCTs is vital for increasing our understanding of cognitive control, there are still important gaps in our conceptualization of the communalities and differences between performances on many different CCTs. In the present talk, we aim to shed some light on the universe of effects that are observed in CCTs by introducing a functional taxonomy of CCTs and the effects they reveal. We argue that much can be gained by describing CCT effects functionally as instances of stimulus control. We then highlight the basis of our taxonomy by illustrating how different CCT effects involve different aspects of stimulus control.

EVALUATIVE LEARNING: PUTTING THE FUNCTIONAL-COGNITIVE FRAMEWORK TO THE TEST

169
Sean Hughes, Jan De Houwer, Marco Perugini

Although humans may be biologically prepared to prefer certain stimuli over others, many of our likes and dislikes are learned through on-going interactions in and with the environment. Over the last thirty years, researchers have identified a number of important pathways through which novel preferences may be formed and existing ones altered. Most of these pathways involve changes in liking due to regularities in the presence of a single stimulus (e.g., mere exposure), two or more stimuli (e.g., evaluative conditioning) or between behavior and its consequences (e.g., approach/avoidance learning). In this talk we offer intersecting regularities as a fourth and previously undiscovered pathway for establishing likes and dislikes. We consider several important properties of preferences that emerge in this way, discuss their implications for functional and mental theories of evaluation and highlight a number of open questions and future directions for researchers in this area. In short, the empirical and conceptual work outlined here represents an example of the functional-cognitive framework ‘in action’.

A FUNCTIONAL PERSPECTIVE ON PERSONALITY STRUCTURE
Marco Perugini, Giulio Costantini, Jan De Houwer, Sean Hughes

Most personality psychology theories aim to describe systematic patterns of stable individual differences in behaviors, sometimes including thoughts, emotions, and motivations and usually referred to as traits. This conceptualization can easily lead to theoretical circularities in which explanans and explanandum are mixed together (e.g., John is extraverted because goes to party and John goes to parties because is extraverted). The possibility of applying a functional approach to personality structure will be explored based on two core ideas. First, personality can be conceived as relatively stable individual differences in the way in which regularities in the environment impact on behavior. Second, different dimensions of personality (e.g., traits) refer to moderating impact of the individual on (a) different types of environment-behavior relations (b) the impact that other moderators (e.g., type of environmental regularity) have on environment-behavior relations, or (c) the selection of environments that is expected to facilitate certain classes of behaviors.

ON THE (UNEQUAL) RELATION BETWEEN FUNCTIONAL BEHAVIORAL SCIENCE AND COGNITIVE PROCESS RESEARCH
Klaus Fiedler

My first and foremost argument is that the relationship between functional and cognitive research is asymmetric; the latter is existentially contingent on the former, but not vice versa. I will not refrain from providing telling examples to explain why the bridges metaphor ought to be replaced a pyramid that clearly conveys the fact that whatever cognitive-process research can accomplish in a few stellar moments must be built on a firm fundament of functional research. I will also dare to express – taking a long-ignored Skinnerian perspective – how modest the theoretical and empirical insights gained from over 50 years of research on cognitive mechanisms have been. To outline my critical appraisal, I will discuss the role of model fitting in general and mediation analysis as an instrument of process diagnosis in particular, and the necessity to validate cognitive models in functional research. For illustration, I will refer to recent developments in priming, to what I call a cognitive-environmental approach to decision making, and to recent evidence on an attention-shift mechanism supposed to underlie illusory correlations.
There is a growing need for psychological assessment across the world. Most psychological tests have been developed in western countries, and are translated for local applications. There have been criticisms on the shortcomings of this imposed etic approach, but the indigenization movement to develop local measures also encountered major limitations. The universal (etic) versus the indigenous (emic) debate is revisited in the internationalization stage of cross-cultural psychology. The combined emic-etic approach to assessment is able to provide a culturally-sensitive perspective to meet local needs while maintaining an international perspective for cross-cultural comparison. This approach involves deriving culturally relevant constructs with bottom-up methods, followed by empirical studies to develop and validate scales, and conducting cross-cultural studies to compare universality. Two successful examples of the combined emic-etic approach to personality assessment are presented in the symposium. Three papers will describe the incremental validity of indigenously derived emic personality scales of the Chinese (Cross-cultural) Personality Inventory in predicting behavioral outcomes beyond etic personality scales. Two papers will introduce the development of the South African Personality Inventory for 11 ethnic and language groups in South Africa and the preliminary findings on its etic and emic personality dimensions. These papers illustrate the principles and methodology in developing and validating indigenously derived personality measures using the combined emic-etic approach, and the promise of this approach in building culturally relevant personality assessment measures.

RELATION OF WORK PERFORMANCE WITH IR FACTOR AND IR FACETS
Jianxin Zhang, Mingjie Zhou, Fen Ren
The Interpersonal Relatedness (IR) factor of personality traits has been consistently found in the analyses of CPAI scales and items, and the factor is composed of such scales as Face (FAC), Renqing (REN), and Harmony (HAR) which reflect the adherence to normative social relationships in collectivistic cultures. It is believed that IR is much rooted in Chinese culture so that it can be used more effectively and specifically to predict Chinese behaviors. Results of the recent studies in China found that the IR trait of Chinese enterprise leaders is related to team performance in a reversed U manner. Team performance scores lower if their leaders possess either higher or lower IR characteristics. It coincides with the relationship between team performance and FAC facet scores of team members. That is, members of a team would perform poorly if they either attach too much or too little importance to face behaviors among themselves. In contrast, the HAR facet can predict team...
performance in a U manner: members of a team perform better if they either attach either more or less importance to harmony among themselves. The implications of these results are discussed.

INCREMENTAL CONTRIBUTIONS OF THE EMIC PERSONALITY FACTOR BEYOND ETIC FACTORS TO UNDERSTAND CHINESE ADOLESCENTS' CAREER DEVELOPMENT

Weiqiao Fan

The study examined the contributions of Interpersonal Relatedness (IR) factor, as the emic factor in the CPAI-A, beyond etic personality factors to career development among adolescents from different China regions. 2193 Senior One students, aged 15-19 years (M=16.39, SD=.58), from Hong Kong (613 students), urban Shanghai (804 students), and rural Zhejiang (776 students), were assessed for their personality traits, vocational situation (i.e., vocational identity, information, and barriers), and vocational exploration and commitment. The results indicated that, after controlling for etic personality factors, the IR factor provided incremental contributions to adolescents’ career development variables in general. However, some local cultural differences were found among the samples. Specifically, IR showed significant contributions to vocational exploration and commitment across the three Chinese samples. For vocational situation, the contributions of IR to vocational identity and occupational information were significant only in the Shanghai and Zhejiang samples, but non-significant results were found in career barriers across three samples. The implications to career guidance for high school students on different Chinese local cultural contexts were discussed.

FAMILY ORIENTATION AS AN EMIC PERSONALITY FACTOR: ITS ROLE IN THE SOCIALIZATION PROCESS OF CAREER DEVELOPMENT AMONG CHINESE ADOLESCENTS

Qian Wang, Fanny M. Cheung, Peter Chit Hei Mok, Weiqiao Fan

The current research examined how family orientation (an emic personality factor identified in previous work on CPAI-A) may moderate the link from career-related parental support to Chinese adolescents’ career decision making self-efficacy. Tenth graders (M age = 16.39 years, SD = .58) in three regions in China (N = 583 in Hong Kong, N = 724 in urban Shanghai, and N = 700 in rural Zhejiang) participated. In predicting career decision making self-efficacy, a significant interaction between career-related parental support and family orientation was found, such that the greater adolescents’ family orientation, the stronger the positive link from career-related parental support to adolescents’ career decision making self-efficacy. This moderating role of family obligation was evident in the three regions and among both males and females. A significant interaction between career-related parental support, region and sex was also found, such that while the positive link from career-related parental support to career decision making self-efficacy was of similar strength among males and females in Hong Kong and urban Shanghai, this link was stronger among males (vs. females) in rural Zhejiang. These findings illustrate how personality factors identified by the combined emic-etic approach may be applied to understand the socialization process of career development among Chinese adolescents, and also highlight the importance to pay attention to similarities as well as differences across different regions within China and between the two sexes.

PERSONALITY STRUCTURE IN SOUTH AFRICA: AN EMIC—ETIC APPROACH

Fons J. R. van de Vijver, Deon Meiring, Velichko H. Valchev

The South African Personality Inventory (SAPI) project aims to develop a personality measure, derived from the implicit personality conceptions in the different cultural groups in South Africa and applicable to all 11 official languages of the country, combining emic and etic aspects of personality. In the qualitative stage, a common personality model was developed from interviews with native speakers of all languages. The model included 9 clusters: Conscientiousness, Emotional Stability, Extraversion, Facilitating, Integrity, Intellect, Openness, Relationship Harmony, and Soft-Heartedness.
In the quantitative stage, starting from the original personality descriptions, nearly 2,500 items were devised and piloted separately per cluster (ns between 439 and 1,023). Hierarchical factor analysis was performed to examine the underlying structure; psychometric and substantive criteria were employed to select items. In consecutive steps, the item pool was reduced to 250 items. The questionnaire was administered to 1,155 participants of all ethnic groups. The resulting structure had six factors, was simpler than the qualitative model, with broader factors and strongly represented social-relational aspects.

**TRAITS AND DAILY BEHAVIOR IN DIFFERENT CULTURAL GROUPS IN SOUTH AFRICA**

*Velichko H. Valchev, Deon Meiring, Fons J. R. van de Vijver,*

There are systematic cross-cultural differences in the way people describe personality: People in individualistic cultures use more abstract trait descriptions and perceive greater cross-situational stability and predictability of behaviors (in short, perceive personality as more traited), whereas people in collectivistic cultures—notably East Asia, but also Blacks in South Africa—use fewer traits and perceive less stability and predictability. The extent to which these differences in perceptions are associated with differences in actual consistency and predictability of behavior has been little researched. The present study examined behavior prediction from trait ratings in Black and White students in South Africa. Participants filled in locally developed personality inventories and measures of hypothesized mediator variables (self-monitoring, lay beliefs, and communication norms), and kept diaries listing personality-relevant behaviors for 21 days. The results are discussed with reference to the integration of trait and cultural-psychology perspectives on personality and of indigenous and cross-cultural psychology.
IS064
INNOVATIVE SCIENTIFIC METHODS FOR APPROACHING COMPLEXITY IN APPLIED PSYCHOLOGICAL RESEARCH

A02. General issues and basic processes - Research design and experimental methods

Convenor   Santo Di Nuovo, University of Catania, Catania - Italy
Presenters Andrea Gaggioli, Catholic University of Milan, Milan - Italy
Barbara Colombo, Catholic University of Milan-Brescia, Brescia - Italy
Daniela Maria Pajardi, University of Urbino, Urbino - Italy
Letizia Caso, University of Bergamo, Bergamo - Italy
Discussant Alessandro Antonietti, Catholic University of Milan, Milan - Italy

Complexity challenges the methods of scientific research, and the experimental approaches have possible shortcomings, regarding uses and misuses of measurement instruments, variables, statistics. Is it possible to approach complexity in psychological applied research? To approach complexity we need appropriate methods, suitable to integrate the classical experimental one, e.g. by monitoring directly the whole action object of study, allowing the ‘sense’ of the studied event to emerge.

The symposium aims to show how innovative methods and instruments can be used for psychological applications useful to fulfill social needs with full scientific validity. After an introduction (by the proponent) regarding the methodological issues aimed at challenging complexity, the contributions to the symposium will deal with different fields of psychological applied research:
- Neurostimulation applied to rehabilitation and cognitive empowerment;
- Positive Technology applied to mental health and wellbeing interventions;
- Evaluation of deception in forensic evaluations
- Evaluation of suggestibility in Juvenile Courts.

The methodological advances and shortcomings in these different applied fields of psychology will be compared and discussed.

References:

NEUROSTIMULATION: A NEW APPROACH TO REHABILITATION AND COGNITIVE EMPOWERMENT

Barbara Colombo

The applications of neurostimulation to enhance motor rehabilitation and to promote cognitive empowerment in adults and aging people will be critically discussed. The use of brain stimulation in
basic research and in clinical applications reflects its capabilities to modulate cerebral function in ways not feasible with other techniques.

**POSITIVE TECHNOLOGY: USING MOBILE PHONES, BIOSENSORS AND VIRTUAL REALITY IN MENTAL HEALTH AND WELLBEING INTERVENTIONS**
*Andrea Gaggioli*

Studies regarding the possibility of using technologies (e.g. smartphones, wearable sensors and virtual/augmented reality) to enhance mental and physical wellbeing. A new field called ‘Positive Technology’ has been developed, combining the objectives of Positive Psychology with advances in interaction design.

**THE IMPACT OF DUAL TASK ON THE EVALUATION OF DECEPTION**
*Letizia Caso, Francesca Morganti and Patrizia Patrizi*

Detecting liars in juridical contexts is very complex and difficult to manage with traditional techniques. Since deceiving is cognitively demanding (involving executive brain center such as the prefrontal cortex), a dual task can be tested asking to resolve a spatial test when telling the lie, analyzing both verbal and not-verbal behaviors.

**STUDIES ON EVALUATION OF SUGGESTIBILITY IN JUVENILE COURTS WITH GUDJONSSON SCALE**
*Daniela Pajardi & Gisli Gudjonsson, M. Vagni, T. Maiorano*

The evaluation of suggestibility is a very intriguing problem in forensic assessment. The Gudjonsson’s GSS2 scale aims to evaluate both yield e shift suggestibility in cases of suspect child abuse. Recent studies have addressed the relations with cognitive and emotional-social aspects relevant for the juridical decision.
This symposium will focus on the applied psychology in China, in relation to traditional Chinese culture. Four speakers will present their studies on Five-pattern Personality Inventory (Qiuli YANG & Huan ZHU), effect of Chinese herb medicine on anxiety (Jianyou GUO), Taoist Cognitive therapy (Guoqiang WANG & Kai ZHANG), and psychology of religion in China (Buxin HAN).

The Chinese Taoist Cognitive Psychotherapy (CTCP) combines the Chinese Taoist's way of keeping healthy with modern cognitive behavioral therapy (CBT). It enlightens people to look at the suffering from a positive perspective, teaches a person to live harmoniously with nature, subject to nature in order to practice non-being, and guides people to maintain psychological balance when we faced several setbacks in our life. Guoqiang WANG & Kai ZHANG will present the detail.

Qiuli YANG and her colleagues developed Five-pattern Personality Inventory. It is the effective application of the theory in the Inner Cannon of Huangdi, to fill the gaps in Chinese personality test, promote the development of psychological test and the traditional Chinese medicine. The inventory for the research and development of TCM psychology and personality psychology plays an important role, and has a certain economic benefits, is worth promoting.

Jianyou GUO tested compound MaTiXiang (CMTX) capsule, composed of four Traditional Chinese medicine (Valeriana Jatamansi Jones, Albizzia Julibrissin, Semen Ziziphi Spinosae and Medulla Junci, is a safe and effective anti-anxiety Chinese Herbs Compound. The effect related to several pathways such as neurotransmitter and inflammatory factors.

Given the thousands years of religious life for most Chinese and over a hundred years of adoption of modern psychology in China, PR as a discipline is just start to develop from perspectives of scientific communication, capacity building, translation of classics, training seminars, project of empirical studies in the 21st Century. Buxin HAN report.
THE INTRODUCTION OF THE CHINESE TAOIST COGNITIVE PSYCHOTHERAPY (CTCP)
Guoqiang Wang & Kai Zhang
CTCP restrict selfish desires; learn to be content and let go; be in harmony with others and humble; use softness to defeat hardness; live together with people harmoniously; overcome hardness with softness; maintain tranquility and act less; follow the laws of nature.
Keywords: Cognitive psychotherapy, Taoist philosophy, maintaining tranquility

PHARMACODYNAMIC STUDY OF THE ANXIOLYTIC EFFECT OF COMPOUND MATIXIANG CAPSULE
Jianyou Guo
Preliminary evaluation of pharmacodynamics about compound MaTiXiang (CMTX) and other tests in rats, showed that in related to several pathways such as neurotransmitter and inflammatory factors, CMTX is safe and effective for treating anxiety.
Keywords: compound MaTiXiang; anxiolytic; elevated plus-maze; light/dark box; open field

THE APPLICATION RESEARCH OF FIVE-PATTERN PERSONALITY INVENTORY
Qiuli Yang & Huan Zhu
Five-pattern Personality Inventory (set in 1987, revised in 2008) is a standardization of indigenous personality test, results included in "The Comprehensive Dictionary of Psychology, General Psychology, The psychology of TCM" and so on.
Keywords: Five-pattern Personality Inventory, Chinese medicine psychology,
IS066
TRAUMA AND MENTAL HEALTH

E05. Health and clinical intervention - Evidence-based psychotherapies

Convenor
Mark van der Gaag, VU University Amsterdam, Amsterdam - Netherlands

Presenters
Anabel Gonzalez, Universitary Hospital of University A Coruña, A Coruña - Spain
Berber van der Vleugel, Community Mental Health Service Noord-Holland Noord, Alkmaar - Netherlands
Dolores Mosquera, Institute for the Study of Trauma and Personality Disorders, A Coruña - Spain
Mark van der Gaag, VU University Amsterdam, Amsterdam – Netherlands

Many clinicians and scientists consider the treatment of trauma to be dangerous for the patients. They anticipate symptom exacerbation and suicide attempts. In a survey 70% of Dutch practicing psychotherapist stated that they would never use EMDR or Prolonged Exposure in patients with comorbid psychotic disorder and 50% would not in dissociative disorder. Psychotic disorder has almost always been an exclusion criterion in scientific research. There is only little evidence and only pioneers have been treating trauma in these severe mental illness (SMI) patients. This symposium will show that treatment is possible, efficacious and safe and that not-treating these patients, is actually the more deleterious option.

Dolores Mosquera is involved in the treatment of personality disorders with severe traumatization. She will give case examples and short video fragments of the ways on how EMDR can be used in the treatment of trauma. Anabel Gonzalez will continue with case examples and demonstrations in patients with schizophrenia and bipolar disorder and clarify the progressive approach that Gonzalez and Mosquera have developed. In the prestigious guidelines by the British National Institute of Clinical Excellence, it is stated that all people suffering from PTSD should be offered EMDR or PE! Yet only minimal evidence was available for patients with a psychotic disorder. This resulted in a large randomised controlled trial in the Netherlands with positive results presented by Mark van der Gaag. In an add-on study, including all subjects with daily auditory verbal hallucinations, a PSYMATE was used for experience sampling. Experience sampling measurements are ecological measurements and can be done by a PSYMATE. During six days it beeped at random times ten times each day. Berber van de Vleugel will present pre and post data of everyday life events, thoughts, emotions and behaviour and the changes that occur as a result of trauma treatment in psychotic patients.

EMDR IN TRAUMATIZED PERSONALITY DISORDERS
Dolores Mosquera
The treatment of severe mental disorders can help us to evaluate the relative contribution of trauma on severe mental illness. Several cases of refractory bipolar disorder or schizophrenia will be presented to illustrate the relationship between traumatic antecedents and refractory symptoms.

REFRACTORY SEVERE MENTAL DISORDERS: THE TRAUMA PERSPECTIVE
Anabel Gonzalez
The treatment of severe mental disorders can help us to evaluate the relative contribution of trauma on severe mental illness. Several cases of refractory bipolar disorder or schizophrenia will be presented to illustrate the relationship between traumatic antecedents and refractory symptoms.
THE RESULTS OF EMDR AND PE IN PSYCHOTIC PATIENTS WITH PTSD: A RANDOMISED CONTROLLED TRIAL
Mark van der Gaag
155 patients with psychotic disorder and PTSD were randomised to EMDR, PE or Waiting List. Therapy consisted of eight sessions of 90 minutes. Therapy was efficacious and safe. Results were retained at 6- and 12-month follow-up.

TREATING TRAUMA IN PSYCHOTIC PATIENTS: AN EXPERIENCE SAMPLING STUDY
Berber van der Vleugel
How is daily life affected by 8 sessions, targeting the worst memories? Reports of experiences (moods, thoughts, feelings and behaviours) were collected at the moment of their occurrence, using the Experience Sampling Method for 6 consecutive days before and after treatment.
There is an evident relationship between diseases and pathogenic memories, both disease-related and belonging to patient’s personal history. Life events may precipitate the onset of the disease and its evolution; major adverse childhood experiences, such as abuse or domestic violence, increases the risk to develop heart disease, cancer, stroke, diabetes and liver disease. The research findings suggest that the impact of negative childhood experiences on adult health is strong and cumulative. Stressful and traumatic memories linked to the disease involve the diagnosis communication, relapses with reduction of physical functionality, side effects of therapies, diagnostic procedures, fear for the future, and future controls. Attachment unresolved issues affect therapeutic alliance with medical teams and doctor – patient communication, and reduce compliance to both diagnostic exams and therapies. As Nietzsche said, still today many Medically Ills suffer more for the fantasies about the disease than for the disease itself, and when we explore fantasies we find that most of them are based on pathogenic unresolved memories, leading to past or future-oriented worries. Someway, by facing a severe disease we meet the inner self, developed through the elaboration we made all along our history.

Psychotherapy through EMDR in Medical Illnesses is aimed at restoring emotional and relational stability in a suffering person, by promoting human and surroundings resources and by helping to face stressful events. Coping skills and processing of distressing memories go along together, as shown in pilot EMDR studies in Oncology, Multiple Sclerosis, life-threatening Cardiac Events, Fibromyalgia. The aim of the symposium is to present the possibilities offered by EMDR interventions in different settings of Medical Illnesses with high emotional charge.

OVERVIEW ON THE IMPACT OF TRAUMATIC STRESS ON MENTAL AND PHYSICAL HEALTH

Michael Haase

Traumatic stress can be dealt with or be the cause of debilitating and chronic diseases. The WHO acknowledges the importance of stress for mental health by introducing a new chapter in the ICD 11 titled 'Conditions that are specifically related to stress'. But also the body keeps the score. This lecture will give an overview on the impact of traumatic stress on mental and physical health as well as on evidence based therapy.

CANCER RELATED TRAUMA AND EMDR TREATMENT: STATE OF THE ART

Liuva Capezzani

The relationship between trauma and resilience to cancer disease can be explained by the Adaptive Information Model which can be considered a new version of the biopsychosocial model in psycho-oncology. Data from monocentric and multicentric researches on EMDR treatment for cancer patients
illustrate this new reading and show EMDR more effective than CBT and supportive therapy for patients with cancer and PTSD diagnoses, both during active medical treatment phase and follow-up medical phase.

EMDR APPROACH IN SPINAL CORD INJURY
Chiara Piroddi
Spinal cord injury (SCI) is a traumatic condition which results in motor, sensory, and autonomic impairments, causing difficulties with functional independence, social integration and employment, besides increased risk of addiction and depression. EMDR treatment is described as a useful tool both to process traumatic memories and to prevent the following adjustment difficulties.

SHORT-TERM EMDR TREATMENT FOR PATIENTS WITH MULTIPLE SCLEROSIS AND PTSD
Luca Ostacoli – Gabriella Bertino
The presentation focuses on the application of a short-term EMDR treatment of 12 sessions for patients with Multiple Sclerosis and PTSD. 50 patients were recruited and randomized to EMDR versus relaxation therapy. Both therapies were effective on Anxiety and Depression, but as regards PTSD EMDR proved to be more effective with 100% resolution.
EATING DISORDERS AND EMDR

F05. EXPO 2015 Hot Topics - Eating Disorders

Convenor: Simona Anselmetti, San Paolo Universitary Hospital, Milan - Italy
Presenters: Maria Zaccagnino, University of Lugano, Lugano - Switzerland
Natalia Seijo, Centro de Psicoterapia y Trauma, A Coruña - Spain
Patrizia Todisco, Casa di Cura "Villa Margherita", Arcugnano - Italy
Simona Anselmetti, San Paolo Universitary Hospital, Milan - Italy

During the last decades research on eating disorders has been increasing, particularly regarding the role of emotion regulation and the link between these disorders and a history of traumatic life events (Putnam, 2001). Trauma theory suggests that the association between traumatic events occurred during infancy and Eating Disorders is better understood as emerging through a series of complicated emotional reactions and coping strategies (Schwartz & Gay, 1996). In this perspective the development of such disordered eating behaviors could be seen as an attempt to manage overwhelming emotions, memories, and stressors experienced in the trauma. Cole and Putnam (1992), in fact, stressed how these traumatic events could lead to deficits in the management of overwhelming emotions and other internal experiences in these individuals.

Regarding the therapy of eating disorders there is a consensus among therapists, regarding the possibility to integrate different strategies of intervention such as the cognitive-behavioral therapy, the family therapy, the dialectic therapy and the psycho-educational support. Several clinicians have suggested an integration with a method focused on the traumatic memories: the Eye Movement Desensitization and Reprocessing (EMDR). The eye movement desensitization and reprocessing is an eight-phase psychotherapy designed to address past negative experiences, current triggers of the symptoms developed from those experiences, and any future blocks to effective functioning (AIP; Shapiro, 2001). The efficacy of EMDR for the treatment of trauma has been well demonstrated in several meta-analyses (Seidler & Wagner, 2006) and numerous researches in the last decades emphasized the efficacy of the EMDR technique in the treatment of Eating Disorders. In the light of the consideration stressed in literature, the main goal of the present symposium is to evaluate the efficacy of the EMDR method on the core symptoms of Eating Disorders compared to the standard therapies. Our hypothesis is that the integration of the EMDR treatment in standard therapeutic settings (out-patients, in-patients, community) could lead to better results than the standard therapy alone.

THE PRESENCE OF TRAUMATIC EVENTS IN ATTACHMENT HISTORY OF EATING DISORDER PATIENTS AND THE INTEGRATION OF EMDR IN STANDARD THERAPY

Simona Anselmetti

This presentation is focused to explore the presence of traumatic events in the history of eating disorders patients with a study assessing the Adult Attachment Interview. Moreover we are presenting a therapy protocol integrating a specific approach to the treatment of “adverse events” (EMDR) in a sample of eating disorder patients.

TREATING EATING DISORDERS WITH EMDR APPROACH: PRELIMINARY DATA FROM A RESEARCH PROJECT

Maria Zaccagnino
Numerous studies, in recent years, have focused on the link between Eating Disorders and a history of traumatic life events. The aim of the presentation is to outline first results from a research project for the evaluation of efficacy of the EMDR approach in the treatment of Eating Disorders, in terms of work on traumatic memories connected to them.

**INTEGRATION OF EMDR INTERVENTION IN A PSYCHO-NUTRITIONAL REHABILITATIVE MULTIDISCIPLINARY INPATIENT PROGRAM FOR EATING DISORDERS (ED): PRELIMINARY DATA IN ED TRAUMATIZED PATIENTS.**

*Patrizia Todisco*

We describe the experience of a Unit specialized in the psycho-nutritional rehabilitation of ED with a multidisciplinary integrated cognitive-behavioural approach adapted to the patients’ traumatic experiences. In the inpatient treatment traumas and the related symptoms are tackled specifically through EMDR.

**THE REJECTED SELF: EMDR AND IMAGE DISTORTION TREATMENT IN EATING DISORDERS**

*Natalia Seijo*

Everything we have heard we are, and the way we were told to be, is tied to our image. In people with Eating Disorders it acquires a value that ends up becoming the centre of their lives. The goal of this presentation is to explain how we can treat the body image distortion from the EMDR perspective in order to work on the awareness of the real body and reach acceptance.
IS069

POSITIVE AND ENVIRONMENTAL PSYCHOLOGY

F11. EXPO 2015 Hot Topics - Environment and sustainability

Convenor Victor Corral-Verdugo, University of Sonora, Sonora - Mexico
Presenters Giuseppe Carrus, University of Roma Tre, Rome - Italy
P. Wesley Schultz, California State University, San Marcos - United States
Susan Clayton, The College of Wooster, Wooster - United States
Victor Corral-Verdugo, University of Sonora, Sonora – Mexico
Discussant Marino Bonaiuto, Sapienza University of Rome, Rome - Italy

A growing number of social and behavioral researchers exhibit an interest in defining and exploring intersections between positive psychology and environmental psychology. Since both approaches share the goals of promoting conditions conducive to human wellbeing and environmental quality, such intersection is promising and deserves consideration. Recent findings show that it is not only possible to gain psychological positivity from exposure to positive environmental conditions, but also that the conservation of the environment is promoted by psychological positivity. Thus, the interdependence between environmental and psychological positivity seems to be a worthwhile subject of study. This symposium is devoted to discuss and explore ways in which environmental psychology and positive psychology may interact in studying human and environmental positivity. One aim of the symposium is to address psychological positivity from the perspective of environmental psychology; a series of studies demonstrating the benefits that people obtain from interacting with the natural environment illustrate this point. One more aim of the symposium is to address the positive psychological instigators of sustainable behaviors, and the psychological benefits that people experience from engaging in environmentally-protective behaviors. Presenters in this symposium introduce a definition of “positive environment,” which is conceived as a context that promotes individual and collective benefits, also influencing human predispositions to conserve the socio-physical structures on which life depends. With these goals and topics in mind, the presentations take into consideration the positive environmental, cognitive, behavioral and affective dimensions interacting with each other in the emergence and maintenance of, both, quality of life for people and environmental quality.

POSITIVE ENVIRONMENTS: THE SEARCH FOR HUMAN WELLBEING AND ENVIRONMENTAL QUALITY
Victor Corral-Verdugo & Martha Frias-Armenta

This paper discusses the role that environments play in the emergence and maintenance of psychological positivity. The traditional view of environmental positivity is contrasted against an ecological vision of positive environments in which the conservation of environmental quality is as important as the satisfaction of human needs. A study is reported.

NATURE AND HUMAN WELLBEING: ENVIRONMENTS AS SOCIAL CUES
Susan Clayton

A growing body of research attests to the potential positive impacts of natural environments on individual responses such as mood, creativity, and stress reduction. This paper discusses more socially-relevant impacts on self-concept and attitudes, also presenting new research as well as reviewing previous studies.
THE BENEFITS OF CONNECTING WITH NATURE
P. Wesley Schultz & Coral Bruni
Symmetrical relationships between attitudes, self-concept, and self-esteem were studied. Participants completed both implicit and explicit measures of connectedness, attitudes, and self-esteem at two time points: upon entering, and exiting a natural park. In short, connecting with nature promoted more positive environmental attitudes and improves self-esteem.

THE POSITIVE CONSEQUENCES OF INTERACTING WITH NATURE IN EDUCATIONAL SETTINGS
Giuseppe Carrus, Sabine Pirchio, Massimilano Scopelliti, Ylenia Passiatore & Francesca Federico
This paper presents findings of field studies assessing contact with nature among pre-school and school children. Those findings show that the experience of contact with nature in educational settings produces positive psychological outcomes, such as improved cognitive performance and positive social interaction. Implications of results are discussed.
CULTURE AND THE BASIC PSYCHOLOGICAL PROCESSES: THE MECHANISMS OF SHAPING DIFFERENCES IN HUMAN NATURE

C17. Culture and society - Psychological processes

Convenor  Pawel Boski, University of Social Sciences and Humanities, Warsaw - Poland
Presenters  Deborah M. Roberson, University of Essex, Colchester - United Kingdom
           Michael Boiger, University of Leuven, Leuven - Belgium
           Pawel Boski, University of Social Sciences and Humanities, Warsaw - Poland
           Piotr Sorokowski, University of Wroclaw, Wroclaw - Poland
           Valery Chirkov, University of Saskatchewan, Saskatoon - Canada

Cultural and cross-cultural psychology have been occupied with three major questions: 1. What are the cultural differences (dimensions) characterizing and differentiating individuals as well as populations across the globe? - Work on values is the most prominent example of this field; 2. To what extent is the claim for psychology being a universal science legitimate, considering its data base largely restricted to WEIRD people, and the challenges coming from traditional cultures?; and 3. Which mechanisms are responsible for cultural determination of psychological processes? This symposium will focus mainly on examining the second and third questions. We will be looking primarily on how research findings demonstrating population variation in basic cognition (colour perception), human body preferences, and emotions, can be explained by cultural factors. Language, ecology, and values/norms will be considered as the key transmission belts in contributions presented by Roberson, Sorokowski, and Boiger. The issue of personal autonomy is essential when we consider individual psyche vis-à-vis culture. A person is not a mere reflection of culture, otherwise her/his psychological make-up would be reduced to a status of an isomorphic epiphenomenon. Chirkov will present relative degrees of personal autonomy allowed by various cultural systems, and their consequences for human growth and well-being.

As a consequence of living in the global world, more and more humans become bi- or multi-lingual/cultural. Because of this trend, a model of psyche shaped by a single culture becomes not adequate. Acculturation studies address the problems of culture acquisition/retention, but less often answers are sought on how a bi-/multicultural mind functions in terms of basic psychological processes. Boski will review the existing literature on alternating and hybrid forms of their organization and, in the role of discussant, he will the opinions of the remaining panelists.

CAN ‘CATEGORICAL PERCEPTION’ REVEAL THE RELATIONSHIP BETWEEN CULTURE, LANGUAGE AND COGNITION?
Deborah M. Roberson
In a number of domains, tests of ‘Categorical Perception’ (CP) are said to reveal either inter-dependence of cognition, language and culture or their complete independence. I will discuss recent findings in the domains of color and facial expressions and consider whether they can tell us anything meaningful about day-to-day cognition in the real world.

ARE THERE UNIVERSAL PHENOMENA AND LAWS IN HUMAN PHYSICAL ATTRACTIVENESS? - EVIDENCE FROM SMALL SCALE SOCIETIES
Piotr Sorokowski
Evolutionary psychology is responsible for the revival of research on physical attractiveness. WHR, LBR, SDS, and other measures have been introduced in the literature, but the data come predominantly from technologically advanced societies. This paper will focus on the findings collected in small-scale societies, questioning the claim for universality of such preferences.

**THE WAY WE MAKE ME FEEL: HOW CULTURAL PROCESSES SHAPE EMOTIONAL EXPERIENCE**

*Michael Boiger*

Emotional experiences vary across cultures in systematic ways. I will review two mechanisms at the heart of cultural variation in emotion: The culturally shared systems of meaning and meaning making (e.g., language and appraisals) as well as the affordances and dynamics of the social environment (e.g., social practices and interactions).

**CULTURE AND PSYCHOLOGICAL AUTONOMY: A THEORETICAL ANALYSIS OF THEIR DIALECTICAL RELATIONS**

*Valery Chirkov*

Dialectical relations between culture and human psychological autonomy will be discussed. Culture is crucial for forming mental representations, sense of self and self-regulation that lay at the basis of psychological autonomy; it supports or hinders the development of autonomous functioning. Empowered by autonomy, people support, reject, or change their cultures.

**PSYCHOLOGY OF BI-/MULTI-LINGUAL AND CULTURAL INDIVIDUALS**

*Pawel Boski*

This contribution will address a question implicit in previous presentations: What happens to psychological processes of individuals who participate in two or more languages/cultures? Literature on alternating (frame switching) and hybrid (mixed) forms of biculturalism will be reviewed, and their implications for psychology of the growing sector of humanity discussed.
Doping in sport, defined as the presence of a prohibited substance or its metabolites or markers in an athlete’s sample, or evidence of the attempted use or use of a prohibited method, appears to be widespread. Empirical evidence on the psychosocial predictors of doping has significantly increased over the last decade. Most important findings are summarized in a recent meta-analysis (Ntoumanis, Ng, Barkoukis & Backhouse, 2014). For example, perceived social norms and positive attitudes emerged as the strongest positive predictors of doping and doping intentions. Morality and self-efficacy to refrain from doping showed up to be most negatively associated with both. But then, there is a paucity of studies that help to develop an integrative view of doping behavior and its psychosocial predictors. In addition, there is limited evidence that findings from the diverse empirical studies conducted so far hold cross-national validity. This symposium illustrates most recent developments and study results from a European network of doping researchers that aim to address these two research gaps. The participating groups from Greece (Aristotle University of Thessaloniki), Italy (Universities “Foro Italico” and “Sapienza” Rome), Denmark (University of Copenhagen) and Germany (University of Potsdam) have been selected for funding by the World Anti-Doping Agency (WADA, Canada) in separately conducted as well as joint research projects and have qualified for being listed in WADA’s social science researcher directory. Their presentations converge in the approach to expand existing views on individual psychosocial predictors of adolescent athletes’ doping behavior by focusing team sport settings. For example, in line with evidence that adolescents’ intentions to use doping substances partly depends on self-efficacy beliefs to resist social pressure for using doping substances, it is plausible to hypothesize that young team athletes may be less susceptible to consider the use of doping substances in presence of strong beliefs that their teammates have the capacity to refuse or to resist external pressures soliciting doping use as well. In other words, it is plausible to hypothesize a mechanism of effects due to self-regulatory “collective” rather than to “personal” efficacy beliefs. The audience of this symposium will learn (1) that young team sports athletes’ intentions to use and actual use of performance-enhancing substances critically depends on interrelated sets of social-cognitive determinants and appraisal processes, (2) that these determinants and appraisal processes explain inter-individual differences occurring within as well as between different sport teams, (3) and that several but not all of these psychosocial characteristics can be generalized across different national contexts.

**DOPING INTENTIONS IN ADOLESCENT TEAM ATHLETES: THE ROLE OF ANTICIPATED REGRET**

*Vassilis Barkoukis & Lambros Lazuras*

The presentation will focus on the role of affective beliefs in decision-making processes in relation to doping use. The effect of anticipated regret in predicting young athletes’ doping intentions will be discussed. In addition, the incremental predictive ability of anticipated regret in doping intentions over and above the effect of planned behaviour theory’s variables will be presented.
SOCIAL COGNITION AND SITUATIONAL APPRAISALS IN DOPING OF SPORT TEAMS: A EUROPEAN CROSS-SECTIONAL ANALYSIS
Arnaldo Zelli, Fabio Lucidi, Luca Mallia, Ralf Brand & Vassilis Barkoukis
The presentation will discuss the results of a cross-national study (i.e. Italy, Germany and Greece) focusing on belief systems (e.g., moral disengagement, regulative self efficacy) and on appraisals of hypothetical interpersonal situations possibly regulating the phenomenon of doping among juvenile sport team athletes.

PSYCHO-SOCIAL FACTORS AND DOPING ATTITUDES IN FOOTBALL PLAYERS: A CROSS-CULTURAL INVESTIGATION
Anne-Marie Elbe, Maria Kavussanu & Antonis Hatzigeorgiadis
We will present the results of a study conducted with competitive football players in Denmark, Greece and the UK investigating motivational climate and moral variables (e.g. moral disengagement, anticipated guilt) in connection with the players’ doping attitudes. Cross-cultural differences and implications for doping prevention will be discussed.

USING THE PROTOTYPE-WILLINGNESS MODEL TO UNDERSTAND DOPING BEHAVIOR
Ralf Brand & Franz Baumgarten
The Prototype-Willingness Models (PWM) suggests that doping behavior can be explained by interacting processes between one reasoned pathway determined by intentions and one social reactive pathway determined by behavioral willingness. We present the fit of data gathered from an international sample of adolescent athletes to the PWM’s central assumptions.
IS072

BIDIRECTIONAL PATHWAYS BETWEEN CLOSE RELATIONSHIPS, HEALTH AND WELL-BEING

E09. Health and clinical intervention - Positivity and well-being

Convenor Dominik Schoebi, University of Fribourg, Fribourg - Switzerland
Presenters Ashley K. Randall, Arizona State University, Tempe - United States
Richard B. Slatcher, Wayne State University, Detroit - United States
Simone Munsch, University of Fribourg, Fribourg - Switzerland
Thomas Ledermann, University of Basel, Basel – Switzerland
Discussant Dominik Schoebi, University of Fribourg, Fribourg - Switzerland

The symposium brings together research on hotspots of the complex pathways linking experiences in family- and similar intimate relationships with physical and mental health. Each of the presentations spotlights the topic from a different angle, relying on different methodological approaches and data, and focusing on various relationship contexts and health facets. Although the linkage between different aspects of close and particularly intimate relationships and physical and mental health is well established, the mechanisms behind these associations are not well understood. Moreover, both theorizing and the available evidence points to the possibility that pathways are bidirectional, which compromises the potential insight on mechanisms that can be gained from cross-sectional or even long-term longitudinal studies. Studies relying on more intensive longitudinal designs are in a better position to provide access to those mechanisms, and the current symposium highlights several variants of such studies in real life contexts, including daily diaries, ecological momentary assessment, weekly reports and ambulatory sampling of auditory recordings. Moreover, an additional challenge in the study of such mechanisms lies the assessment of pathways in data from more than two individuals in relationships, such as a family of two parents and one child. One contribution thus focuses on methodological and modelling challenges of complex relationships with multiple members and proposes solutions.

Taken together, the symposium offers insight into cutting edge research on the links between family- and other intimate relationships and health. This research moves its focus more and more into the reality of complex experiences, tracing individuals from hour to hour, day to day and week to week, as they navigate their daily lives together with their families, partners and friends.

INTERPERSONAL EMOTION DYNAMICS OF SAME-SEX COUPLES IN THE U.S. EXPERIENCING STRESS

Ashley K. Randall & Casey J. Totenhagen

The study examines concurrent or lagged variations in daily negative emotional experiences of partners in same sex couples, and how the experience of different types of stressors (e.g., minority stress) moderates partners’ emotional connectedness. This contribution presents novel findings on interpersonal emotional dynamics in same-sex couples.

NEUROENDOCRINE AND HEALTH EFFECTS OF FAMILY RELATIONSHIPS AMONG YOUTH WITH ASTHMA

Richard B. Slatcher

This research examines daily family experiences and their stress responses in 50 youth with asthma. The study used the Electronically Activated Recorder (EAR) to examine momentary auditory data on
conflict and positive parental behaviors in families, and their impact on salivary cortisol as a health relevant biological stress marker.

**ASSESSING ASSOCIATIONS BETWEEN MEMBERS AND SPECIFIC PATTERNS IN SMALL GROUPS**  
*Thomas Ledermann*  
This paper reviews statistical approaches to model interpersonal influence in groups of two and more individuals, and presents modeling solutions to examine data from two or more individuals belonging to different groups or roles. Examples are provided based on existing health relevant data from individuals belonging to families.

**PERCEIVED REJECTION, EMOTION DYSREGULATION AND BINGE EATING IN DAILY LIFE**  
*Simone Munsch & Dominik Schoebi*  
This paper presents multiple studies based on momentary assessments of perceived rejection and acceptance from close others, and their link with psychological distress, as reflected by emotional dysregulation, chronic pain and binge eating. This research presents novel findings on short term dynamics between rejection experiences and maladaptive emotion regulation patterns.
Parenting is a multifaceted construct, including a variety of preventive and remedial practices, as well as a general climate involving the child and the adults. A large body of research has demonstrated the detrimental effects of negative parenting, with special emphasis on harsh discipline and/or neglect. This symposium focuses instead on the positive parental actions / overall family climate, which provide insights on the role of parents in preventing the child’s difficulties or in effectively managing existing problems. Different ages will be considered, since preschoolers to adolescents, as well as different problems: physical integrity in the daily activities (Di Norcia, Bombi and Cannoni), cognitive and emotional regulation in children with ADHD (Pezzica, Bigozzi and Pinto), monitoring of videogames use (Di Blasio) and behavior with peers (Camodeca and Mazzone). The contribution of each paper will be discussed in terms of possible interventions to promote children’s wellbeing, both outlining effective ways of doing, and discovering critical issues.

RISK TAKING IN PRESCHOOLERS: A COMPARISON BETWEEN MOTHER’S AND CHILDREN’S PERCEPTIONS
Anna Silvia Bombi, Anna Di Norcia, Eleonora Cannoni
In a structured interview, 131 preschoolers were asked to imagine themselves in potentially risky play situations and to report the risk level (a) they preferred and (b) their mothers allowed. Mothers reported their ideas about children’s choices in (a) and their own perspectives on (b). Answers about (a) were similar, but children’s perception of (b) were too optimistic. Only children’s choices in (a) predicted their injury behavior.

COGNITIVE, EMOTIONAL AND BEHAVIORAL DYSREGULATION IN CHILDREN WITH ADHD: THE PROTECTIVE ROLE OF PARENTING SKILLS
Sara Pezzica, Lucia Bigozzi, Giuliana Pinto
The paper presents the effects of two types of Parent Training treatment for parents of children with ADHD. Treatments focused on the development of specific parenting skills in order to create a familiar environment able to cope with the dysregulation of the child and to build positive relationships, thus preventing the worsening of the situation.

PARENTAL MONITORING AND USE OF VIOLENT VIDEOGAMES IN ADOLESCENCE
Luca Milani, Giacomo Davide Fumagalli, Paola Di Blasio
We used a cross sectional methodology to assess associations between use of violent videogames, parental monitoring and level of aggression. 348 adolescents 13-17 years old, were administered: ad-hoc questionnaire of videogame use; Youth Self Report; Monitoring Scale. Almost half of the
participants use videogames that are inappropriate for their age. Parental monitoring is negatively associated with the amount of videogame use. The amount of violence in the videogame predicts antisocial behavior.

THE RELATION BETWEEN FAMILY FUNCTIONING AND BULLYING, DEFENDING AND PASSIVE BYSTANDING BEHAVIOURS: THE MEDIATING ROLE OF PROSOCIALITY

Marina Camodeca, Angela Mazzone

The relationship between family functioning and roles in bullying, and the mediating role of prosociality were examined in 213 preadolescents (mean age = 12.3). Familial cohesion, flexibility, and satisfaction positively affected defending behaviour through prosociality, whereas negative associations were found for bullying and passive bystanding.
IS074
READINESS FOR AGGRESSION IN EMERGING ADOLESCENTS - SOCIOCULTURAL AND FAMILY SOCIALISATION FACTORS

B08. Development and education - Bullying and aggression

Convenor      Adam Fraczek, The Maria Grzegorzewska Academy of Special Education, Warsaw - Poland
Presenters    Adam Fraczek, The Maria Grzegorzewska Academy of Special Education, Warsaw - Poland
               Hanna Liberska, The Maria Grzegorzewska Academy of Special Education, Warsaw - Poland
               Karolina Konopka, The Maria Grzegorzewska Academy of Special Education, Warsaw - Poland
               Magdalena Rowicka, The Maria Grzegorzewska Academy of Special Education, Warsaw - Poland
               Marta Rutkowska, The Maria Grzegorzewska Academy of Special Education, Warsaw - Poland
Discussant    Adam Fraczek, The Maria Grzegorzewska Academy of Special Education, Warsaw - Poland

The objective of the symposium is to present insights and developments in the area of the measurement of interpersonal readiness for aggression, its sociocultural, socialisation and temperamental predictors, as well as ideological correlates among adolescents.

Readiness for aggression is defined as a set of psychological processes and structures that regulate aggressive manifestations. In the theoretical model three classes of mechanisms underlying aggressive behaviours were identified: Emotional-Impulsive Readiness (E-IR), Behavioural-Cognitive Readiness (B-CR) and Personality-Imminent Readiness (P-IR) (Fraczek, 2008). The constructed instrument, the Readiness for Interpersonal Aggression Inventory (RIAI; Fraczek, Konopka & Smulczyk, 2008) has been empirically tested and confirmed the tridimensional model in Poland and Spain (emotional-impulsive, habitual-cognitive, personality-immanent).

Cross-national empirical studies have shown a relationship between patterns of readiness for aggression, intra-family socialisation (parenting style), cultural experiences in childhood, gender and gender identity (feminine/masculine). Masculine compared to feminine individuals are predominantly characterized by habitual-cognitive readiness for aggression, whereas emotional-impulsive readiness is higher among females than males and habitual-cognitive readiness is higher among males than females.

Analysis performed on data obtained from well-adjusted and maladjusted (prisoners) young adults show that the adjustment moderates the level of readiness of aggression but parenting practices and styles experienced in childhood may contribute to the intensity of interpersonal readiness for aggression.

Further social (family emotional climate, social support) and temperamental characteristics are expected to predict interpersonal readiness for aggression as well functioning in the role of a victim or an aggressor.

Research show that personal patterns of readiness for aggression influence the approval for violence in social life as well as the differences in attitudes towards particular ethnic group which can be expected to be function of left-right belief, economic and political identification, which, in turn, can be related to political party support.
CONSTRUCT VALIDITY AND FACTORIAL INVARIANCE OF THE READINESS FOR INTERPERSONAL AGGRESSION INVENTORY, TESTING METRIC EQUIVALENCE IN SPANISH AND POLISH POPULATIONS.

Adam Frączek

The Readiness for Interpersonal Aggression Inventory (RIAI) is designed for assessing a set of psychological processes and structures that underlay aggressive manifestations. RIAI was thought to identify three main mechanisms: Emotional-Impulsive, Behavioural-Cognitive and Personality-Imminent Readiness; the tridimensional structure has been confirmed empirically in Poland and Spain.

TEMPERAMENTAL AND SOCIAL CONDITIONS OF THE TENDENCY FOR AGGRESSIVE BEHAVIOR AND FUNCTIONING IN THE ROLE OF A VICTIM OR AN AGRESSOR IN EMERGING ADOLESCENTS: THE DEVELOPMENTAL PERSPECTIVE.

Hanna Liberska

The study aimed to define the temperamental and social conditions that may contribute to readiness for aggression, acting like an aggressor or a victim. Family emotional climate, social support, sex and temperament were taken into account to predict and compare the contribution of each of them to three aggression-related aspects considered in this study.

GENDER IDENTITY AND READINESS FOR AGGRESSION AMONG MALES AND FEMALES

Karolina Konopka

The study examined the role of gender and gender identity (masculinity and femininity) of young adults in three forms of readiness for aggression (emotional-impulsive, habitual-cognitive, personality-immanent); showing gender and gender identity differences, and providing unique models for each type of readiness for aggression with respect to the examined characteristics.

INTRAFAMILY SOCIALIZATION FACTORS AS A PREDICTORS OF READINESS FOR AGGRESSION AMONG PRISONERS.

Marta Rutkowska

This study was to identify socialization factors that contribute to readiness for aggression in prisoners and well-adjusted young adults. Focusing on parenting practices and styles experienced in childhood, the unique models of family predictors were established for prisoners and non-prisoners, as well as, for each type of readiness for aggression.

READINESS FOR AGGRESSION AND LEFT-RIGHT WING ORIENTATION AMONG YOUNG ADULTS.

Magdalena Rowicka

This study investigated the relationship between patterns of three types of readiness for interpersonal aggression, autoidentification on the left-right wing scale related to the content of acceptable beliefs related to their identification as well as economic domain, political autoidentification and declared support for main political parties.
Interpersonal violence, specially chronic victimization of women and children, is a underestimated health risk factor for population. Traumatic events, like violence, violate the autonomy of the person at the level of basic bodily integrity. The body is invaded, injured, defiled. Traumatic events have primary effects not only on the psychological structures of the self but also on the system of attachment and meaning that link individual and the family. Through the practice of dissociation, voluntary thought suppression, minimization, they learn to alter an unbearable reality. They develop a doublethink: the ability to hold contradictory beliefs simultaneously (Herman 1992).

The purposes of this symposium is to give useful information about approaches of intervention for both victims and perpetrators of domestic and sexual violence, and give some guidelines to prevent emotional impact on clinicians when working with trauma and vicarious traumatization. During the symposium presenters will describe the effects of ongoing trauma on personality organisation and the effects of childhood trauma, abuse and neglect. They point out the traumatic impact of prolonged victimization on development characteristic personality traits, including alterations in empathy and identity. Some specific approaches to victims of domestic and sexual violence are explored included the risk assessment for domestic violence. Authors will illustrate some specific intervention with sex offenders and domestic violence perpetrators. In particular the use of EMDR on both victims and perpetrators during the treatment phases. Specificity of approach and intervention with victims and perpetrator will be described, with a focus on court-prescribed treatment and risk assessment. An outline of treatment for sex offenders (classical relapse prevention model, Good Lives Model, CIPM model) will be provided.

Some issues about vicarious trauma will be discussed in order to understand traumatic countertransference and the importance of therapist’s support system.

TREATING TRAUMATIC IMPACT OF VICTIMIZATION IN SURVIVORS.
S. Teresa Bruno
The victimization process changes the victim internal world. It’s at the origin of pathogenic statements and can operate like malignant hypnotic suggestions. Understand this process is crucial for recovery treatment of complex psychobiological dysregulation in IPV survivors. The recovery stages process is described with particular attention at EMDR use in the different stages.
TREATING SEXUAL OFFENDERS. A CLINICAL-CRIMINOLOGICAL APPROACH  
Carla Maria Xella  
Specificity of approach and intervention with perpetrators of sexual violence against both women and children will be described. A model of intervention based on relapse prevention and Good Lives plans, including the use of EMDR, will be provided.

PSYCHOTHERAPY FOR MEN PERPETRATORS OF VIOLENT BEHAVIOUR  
Paolo De Pascalis  
Clinical Psychology Asl Modena provides individual and group psychotherapy for men perpetrators of domestic violence. This is the first center in Italy working in this field of public service. The goal is to make them responsible for their behaviors and to stop it, encouraging a more appropriate relationship based on gender equality and respect for women and children’s autonomy.
E-HEALTH, PSYCHOLOGY AND MEDICINE: THE FUTURE OF A CLOSE COOPERATION

E11. Health and clinical intervention - Lifestyles and healthy self-regulation

Convenor Telmo Mourinho Baptista, University of Lisbon, Lisbon - Portugal
Presenters Artur Rocha, INESC TEC - INESC Technology & Science Campus da FEUP, Porto - Portugal
Francisco Miranda Rodrigues, University of Lisbon, Lisbon - Portugal
Maged N. Kamel Boulos, University of the Highlands and Islands, Elgin - United Kingdom

Discussant Telmo Mourinho Baptista, University of Lisbon, Lisbon – Portugal

E-Health is already a reality today and not some future dream. E-Health can infuse a new life into the ‘health for all’ goal. But how can we link e-Health to psychology and how can we use e-health in developing psychology evaluation and intervention programmes? Psychological health problems are a major public health concern. Behavioral health problems and unhealthy lifestyles are responsible for lost-years-of-life and premature mortality, as well as for years of productive life that are lost due to disabilities (DALY’s). Psychologists and their psychological knowledge and research evidence must be called in to this key health area, to help in designing and developing the best e-health solutions and applications for reinforcing positive behaviour and lifestyle modifications. Newer concepts such as gamification can be used more effectively with evidence-based contributions from the field of psychology. How can gamification – the utilization of game elements – be best used in non game situations as an effective way for the promotion of health behavior change? Why has it failed so many times in several applied areas, although it has been presented as a powerful tool? Health problems with behavioral causes are a priority of the World Health Organization. Mobile communication technologies and the Internet have been offering a privileged field for the discovery of answers to some of these problems. Because of its perceived closeness to games, gamification is also a privileged way to health behaviors promotion. These are the questions and problems we are trying to provide some answers and solutions for: to make technology a true and effective way in promoting health and wellbeing, positive health behavior changes and good habits.

NEW CHALLENGES DEMAND NEW STRATEGIES
Telmo Mourinho Baptista
The importance and urgency to develop strategies for the prevention and promotion of health is closely related to the challenges facing health needs. New areas of confluence of different types of knowledge (such as medicine, psychology, health informatics) need to be integrated to create new instruments to help people in their health objectives.

GAMIFICATION AND E-HEALTH
Maged N. Kamel Boulos
We present the main ingredients for a successful implementation of game mechanics (gamification) in e-health interventions intended for health-related behaviour and lifestyle modifications (e.g., in obesity [diet and exercise] or for smoking cessation), drawing on the best current research evidence in this domain, including mobile game apps.
SELF-REGULATION AND GAMIFICATION
Francisco Miranda Rodrigues
Motivation and self-regulation skills are fundamental to health habits formation and change. Self-regulation depends on self-monitoring of health behaviours and social and cognitive conditions for these behaviours to happen. Combined with new health informatics technologies, Gamification allows a new implementation of self-regulation strategies.

ICT4D - PLATFORM FOR INTERNET-BASED DEPRESSION TREATMENT
Artur Rocha
ICT4D is an innovative platform for the treatment for depression that combines both internet and mobile technologies, and face-to-face interventions. First used during the ICT4Depression project, this platform will now be used to support Comparative Effectiveness Research (TAU vs blended) in 5 countries performing RCT in the scope of E-COMPARED.
IS077

BIOLOGICALLY-BASED AND CULTURALLY-BASED VARIETIES OF HUMAN PROSOCIALITY AND MORALITY: SOCIALIZATION AND PERSONALITY MECHANISMS

B05. Development and education - Moral development and prosocial behaviour

Convenor Gustavo Carlo, University of Missouri, Columbia - United States

Presenters Darcia Narvaez, University of Notre Dame, South Bend - United States
Deborah Laible, Lehigh University, Bethlehem - United States
Laura Padilla-Walker, Brigham Young University, Provo - United States
Maria Mestre, University of Valencia, Valencia - Spain
Maria Rosario T. de Guzmán, University of Nebraska-Lincoln, Lincoln - United States

Whereas traditional models emphasized social cognitive influences (e.g., Kohlberg, 1969), more comprehensive models have emerged that account for biological- and cultural-based aspects of moral development. Drawing from evolutionary, temperament, personality, social cognitive, cultural, and socialization models of development, scholars are currently examining the wide range of influences on moral development. Furthermore, these new research efforts adopt paradigms that acknowledge the interactive and dynamic mechanisms of development. The present symposium is designed to present examples of these new research paradigms, and to summarize recent findings that advance our understanding of moral development.

The symposium gathers researchers from a wide range of theoretical perspectives that use diverse methods and study diverse samples. Biological perspectives are exemplified in the research on temperament (Laible and colleagues) and attachment and the evolved developmental niche (Narvaez and colleagues). Cultural and socialization processes are focus of the studies on community building and shared cultural practices in Poland (de Guzman and colleagues), parental socialization practices (Laible and colleagues) and parenting styles (Walker & Carlo). Finally, the work on sympathy, empathy, and perspective taking (Walker & Carlo; Carlo and colleagues) represents social cognitive perspectives. These influences are studied using multiple methods (e.g., multiple reporters, observations, interviews) and in diverse populations (e.g., Poland, U.S., Turkey, Spain). The works represent a wide range of moral outcomes and analytical approaches (e.g., latent growth curve modeling, qualitative, structural equation modeling). Thus, the findings will significantly contribute to richer conceptualizations of moral development and greater understanding of the complex, interplay mechanisms that account for such development.

BAYANIHAN: COMMUNITY BUILDING AMONG FILIPINOS IN POLAND

Maria Rosario T. de Guzman, Carolyn P. Edwards, & Jill Brown

This phenomenological study examines the process of community building within a growing Filipino population in Poland. Qualitative data from interviews and focus group discussions evoked themes reflecting the roles of religion, helping, cooperation, shared cultural practices, and individual agency in coping with challenges related to migration.

THE EVOLVED DEVELOPMENTAL NICHE AND ITS EFFECTS ON MORALITY IN ADULTS
Darcia Narvaez, Lijuan Wang, Ashley Lawrence, & Ying Cheng
Like other animals, humans evolved intense parenting to optimize offspring development. Studies show evolved practices are related to moral development in young children. Here mediation models based on adult retrospective reports of childhood experience show significant paths from attachment, mental health, moral capacities to moral orientation

LATENT GROWTH CURVE ANALYSIS OF SYMPATHY AND PROSOCIAL BEHAVIOR DURING ADOLESCENCE
Laura Padilla-Walker & Gustavo Carlo
Prosocial development is influenced by a variety of dispositional and relational variables. However, we know little about longitudinal change in prosocial behavior during adolescence. This paper will use latent growth curve modeling to determine whether longitudinal change in sympathy and parental warmth are associated with change in prosocial behavior.

THE LONGITUDINAL ASSOCIATIONS BETWEEN TEMPERAMENT, PARENTING, AND YOUNG CHILDREN’S COMFORTING, COOPERATION, HELPING, AND SHARING
Deborah Laible, Gustavo Carlo, Asiye Kumru, & Cara Streit
Mothers of 293 Turkish children completed measures of parenting, temperament and prosocial behavior. Analyses showed induction (age 4) was related to approach (age 6), which predicted prosocial behavior (age 7). Maternal warmth (at 4) was linked with less reactivity (at 6), which predicted more helping, and had direct links with cooperation (at 7).

A CROSS-CULTURAL STUDY OF PARENTAL USE OF REWARDS, EMPATHY-RELATED TRAITS AND PROSOCIAL BEHAVIORS
Gustavo Carlo, Maria Mestre, Ana Tur-Pocar, Paula Samper, & Natalie Johnson
Examined the relative effects of parents’ use of social versus material rewards on adolescents’ empathic tendencies and prosocial behaviors in adolescents from Spain and the USA. Discussion will focus on the different roles of social and material rewards in predicting prosocial tendencies.
EMDR: THEORY, PRACTICE AND RESEARCH APPLICATION IN A MASS DISASTER

EMDR has demonstrated effectiveness in treating chronic PTSD and old trauma memories, yet early EMDR intervention, specially in mass disasters could be of great interest for prevention and intervention in the field of mental health. EMDR can be part of a comprehensive treatment and can become an elective treatment for people who can be very exposed when a disaster hits a community. The presentations will highlight clinical aspects of using EMDR following recent trauma of great magnitude such as earthquakes or murders of children.

Objectives of the Symposium are numerous. First of all, the authors will show the outcomes of EMDR interventions in different areas, focusing on both natural disasters and social tragical events. These interventions were delivered to the affected population in the aftermath of such catastrophes in order to study the structure and the effectiveness of treatments in the acute phase of trauma. The authors will describe throughly the development of individual and group treatments and their connections with the reductions of PTSD symptoms. They will present epidemiological data and measured change in post-traumatic stress before and after EMDR. Moreover, the authors will highlight the effectiveness of these interventions in different periods of life, specifically childhood and old age. Findings of these studies suggest that EMDR treatment is a valid early trauma-focused intervention in case of community disasters: it is not only effective in the process of recovery from trauma but it also facilitates the traumatic episode narrative and the normal process of mourning, thus preventing the development of future emotional deseases. As part of a comprehensive approach, intervening with EMDR has proven to give a significant contribution. At the end of the Symposium practical guidelines for implementation of EMDR in the acute and chronic phase of trauma after a mass disaster will be provided.

OUTCOMES OF ACUTE PHASE TREATMENTS FOLLOWING THE EARTHQUAKE THAT HIT EMILIA IN 2012
Elisa Bergonzini
On the 20th and 29th of May 2012, Emilia was hit by two major earthquakes of a magnitude 5.9 on the Richter scale. This study shows the outcome of EMDR interventions provided within three months after the events. At the end, considerable attention will be devoted to the results of these interventions on older people (>65).

EMDR WITH CHILDREN INVOLVED IN MASS DISASTER
Isabel Fernandez
EMDR can be an early trauma-focused treatment with children involved in mass disasters. Individual and group sessions can be used for school children seriously exposed to trauma and grief including:
threat to life, loss of friends and siblings, etc. During the presentation the structure of an intervention in the acute phase will be described.

EMDR: OUTCOMES OF GROUP TREATMENTS FOLLOWING COMMUNITY DISASTERS
Lucia Formenti, Maslovaric G., Gilardi T., Mastronardi C., Perilli S., Sacchezin S., Fonticoli E., Luzzi M., Paturzo C.
This study describes the application of EMDR in group as an early trauma-focused intervention with children involved in three different community disasters. Results indicated that after EMDR group treatment children had a lower percentage of post-traumatic symptoms and subjective psychological distress.
IS079
SOCIAL ASPECTS OF LEARNING AND REMEMBERING

A09. General issues and basic processes - Learning and memory

Convenor  Peter Graf, University of British Columbia, Vancouver - Canada
Presenters  Maria A. Brandimonte, Suor Orsola Benincasa University, Naples - Italy
            Peter Graf, University of British Columbia, Vancouver - Canada
            Wendy Jolliffe, University of Hull, Kingston upon Hull - United Kingdom
            William Hirst, New School for Social Research, New York - United States

Learning and remembering often appear to have a social aspect which is underscored, for example, when students must collaborate in figuring out how to build a web-site or when a married couple attempts to recollect details from their long-ago wedding day. But social learning/remembering is not universally recognized as a valid and distinct phenomenon, or as valuable pedagogic approach; especially in higher education (e.g., college and university), the emphasis is still on solo learning and social aspects are frequently regarded as interchangeable with other aids that could be provided to facilitate learning and remembering (e.g., video aids, study guides, different viewpoints). In support of the hypothesis that social, collaborative learning and remembering are more than augmented solo learning/remembering, one contribution to this symposium reports new research on the costs and benefits which can occur in collaborative retrospective remembering. Another contribution focuses on social prospective remembering -- remembering to do something for others -- and shows that this form of memory is affected by both the amount and type of reward associated with successful performance. A third contribution concerns the mindset people engage for interpreting memory failures, and shows that such failures are perceived as particularly serious if they are about the future (i.e., prospective memory failures) and if they impact other people. The final contribution to this symposium focuses on the conditions which are necessary for true collaborative learning, and it uses research to highlight elements which are critical for designing effective teacher education programs and for implementing cooperative learning more generally in higher education.

LONG-TERM SELECTIVE FORGETTING AFTER LISTENING TO SELECTIVE REMEMBERING: A CONSEQUENCE OF COLLABORATIVE LEARNING
William Hirst, Martin Fagin & Robert Meksin
Listening to another’s recollection of events produces selective memory improvements and selective forgetting. The most definitive study suggests that long-term retention is more likely when interweaved selective remembering and re-exposure trials are distributed than massed. Our research investigated this hypothesis with retention intervals up to a month, and our results highlight both the costs and benefits of collaborative remembering.

EFFECTS OF MATERIAL AND NON-MATERIAL REWARDS ON REMEMBERING TO DO THINGS FOR OTHERS
Maria A. Brandimonte & Donatella Ferrante
Previous research shows that pro-social prospective memory -- remembering to do something for others -- is impaired by small material rewards. We have recently found that the amount and type of reward have different effects on pro-social prospective memory, on concurrently ongoing activities, and on participants’ predictions about future pro-social actions. We hypothesize that reward effects are modulated by conscious or unconscious motivational mechanisms.
MEMORY FAILURES ARE MORE SERIOUS IF THEY ARE ABOUT OTHERS AND ABOUT THE FUTURE

Peter Graf & Michelle Crease Lark

Memory failures are assumed to be interpreted differently if they concern the past (retrospective) rather than the future (prospective). Our research shows differences between retro- and pro-spective memory (e.g., the latter are regarded as being more serious), but only when interpreting failures that occurred in a social context. We use the findings to speculate about the different schemas engaged for interpreting retro- and pro-spective memory failures.

DEVELOPING COOPERATIVE LEARNING PEDAGOGY IN INITIAL TEACHER EDUCATION

Wendy Jolliffe

Cooperative learning - a strategy in which students work in teams to improve their understanding of a subject - presents a variety of challenges. Research shows that training teachers in cooperative learning impacts their understanding, attitudes and classroom practice. I use research findings to identify critical elements in designing effective teacher education programs and for implementing cooperative learning more generally in higher education.
PS080
THE PROFESSIONAL CAREER OF PSYCHOLOGISTS IN THE CYBERSPACE

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Convenor        Stefano Manzo, Ordine Psicologi Regione Campania; Anima Research Institute, Naples - Italy
Presenters       Stefano Manzo, Ordine Psicologi Regione Campania; Anima Research Institute, Naples - Italy

Anna Cannata, Anima Research Institute, Naples - Italy
Christiane Eichenberg, Sigmund Freud University, Vienna - Austria
Alessandro Calderoni, Psymind; Fatebenefratelli Hospital, Milan - Italy
Discussant       Antonella Bozzaatra, Campania Region Psychologists Association, Naples - Italy

The wide diffusion of new communication technologies, empowered by the use of the web, is changing the traditional modalities of working, of dealing with commercial exchanges, of offering services, of socializing. Structures, institutions, services and performances are undergoing the inescapable processes of deconstruction and digitizing, and are urged to the use of the cyberspace; people search for information concerning psychological care, health and wellbeing; services and professional performances are offered directly online. As a consequence, the professionals of the psychological sectors are urged to adapt and supply their psychological interventions according to this new dimension.

But, notwithstanding the advantages, those technologies entail some levels of criticality. Both clients and professionals feel that, added to the fear for a subversion of our traditional relationships, it is the confusion and uncertainty given by a chaotic and unregulated offer for both services and performances, and involving the efficiency and dependability of the psychological interventions.

All this aspects have produced two opposite effects: either an uncritical acceptance of logics, procedures, and instruments which do not belong to the psychological profession, or the total refuse of the new technologies. In the meantime, there has not been occasion to reflect and analyse the relationship among the conveniences offered by the new communication technologies and the psychological processes they involve. On the contrary, we consider it is necessary to regain the specificity of our profession, by reflecting on shape and content it could assume inside this new context.

The present symposium is aimed at reinforcing and integrating those researches aimed at exploring the state-of-the-art of the online psychological interventions. More in details, we will present the results of our researches in: drawing an updated map of the online psychological services offered in Italy; analysing the representations that psychologists have of the online psychological interventions; conducting an inquiry on the expectations of the “clients” on the psychological services; studying the effects of a psychological service offered to “native digit” generations.

Our researches start by drawing a conceptual map of the reality of the psychological interventions in the cyberspace, reporting limits and potentialities of these new forms of intervention. It would then focus on identifying general principles able to guarantee the high quality and competency of the professionals of the psychological sector; drawing guidelines, clear and coherent with the ethics of the profession, addressed to both the government decision-makers and our committee; identifying possible perspectives for the future of our profession.
THE PROFILE OF A PROFESSIONAL IN THE CYBERSPACE; A PRELIMINARY INQUIRY AMONG PSYCHOLOGISTS OF THE CAMPANIA REGION
Stefano Manzo
He will present an inquiry conducted among psychologists of the Campania Region, collecting the different opinions and expectations on the online psychological intervention: who is already working online, who would like to, who would never do it.

THE PSYCHOLOGICAL SERVICES INTO THE CYBERSPACE; A FIRST CENSUS ON THE SERVICES OFFERED IN ITALY
Anna Cannata
She will present the results of a survey censing the psychological services offered in the cyberspace inside the Italian territory, aimed at identify their typologies, characteristics and peculiarities, main strength and weak points.

THE INTERNET AS A MENTAL HEALTH ADVISOR IN GERMANY – RESULTS OF A NATIONAL SURVEY
Christiane Eichenberg
The internet constitutes a popular source of health information. However, the use of the internet and other modern media in the domain of mental health remains widely unclear. This study aimed at exploring the readiness for seeking information online and making use of online counseling and media-assisted psychotherapy.

ZHENG, THE FIRST ITALIAN FACEBOOK-BASED ON LINE HELP FOR TEENS: PROJECT, MODEL, OUTCOME
Alessandro Calderoni
Zheng was born in 2010 as the first public and free Italian service for psychological help aimed at teenagers on Facebook. In the first year of its history, Zheng scored almost 900 teen users, more than 500 chat, and 300 email. In 2014 it still works and it’s a model for other services.
PS081
THE PSYCHOBIOLOGY OF STRESS

A04. General issues and basic processes - Psychobiology

Convenor        Michael Smith, Northumbria University, Newcastle upon Tyne - United Kingdom
Presenters       Mark Wetherell, Northumbria University, Newcastle upon Tyne - United Kingdom
                  Angela Clow, University of Westminster, London - United Kingdom
                  Michael Smith, Northumbria University, Newcastle upon Tyne - United Kingdom
                  Sarita Robinson, University of Central Lancashire, Preston, Lancashire - United Kingdom
Discussant       Angela Clow, University of Westminster, London - United Kingdom

This symposium will be presented by members of the British Psychological Society (BPS) Psychobiology Section with expertise in the psychobiology of stress. Each speaker leads a research programme, collectively investigating i) the basal functioning and reactivity of endocrine and cardiovascular parameters relating to stress, ii) psychosocial factors which may impact upon functioning of these endocrine and cardiovascular systems and iii) the role of these systems in mediating such outcomes as health and cognitive performance. The first talk will consider the effect of anticipation on the release of the stress hormone cortisol, and will suggest that this may be a mechanism by which the individual prepares biologically for forthcoming demand. The following talks will consider the role of individual differences in modifying the psychobiological response to stress. The second talk will suggest that insecure anxious attachment style is associated with an increased cortisol response to psychosocial stress. The third talk will demonstrate that Type D (distressed) personality is associated with a blunted cardiovascular response to stress, and will consider whether dysregulation of the HPA axis in this group of individuals may explain the increased physical health symptoms associated with Type D personality. The final talk will discuss the impact of facing life-threatening, stressful situations on cognitive performance. Taken together, the symposium aims to consider the role of psychobiological stress reactivity, and basal functioning of psychobiological stress systems on health, wellbeing and cognition, as well as inter-individual differences which may be involved in dysregulating psychobiological stress pathways and stress reactivity. From an applied perspective, it is important to identify the health and cognitive implications of a dysregulated stress response so that targeted interventions can be developed. The symposium is supported by the BPS Psychobiology Section.

ASSESSING THE PSYCHOBIOLOGICAL MECHANISMS INVOLVED IN THE ANTICIPATION OF STRESS
Mark Wetherell
Cortisol is increased during stress. The anticipation of stress also leads to increased secretion and may prepare the individual for forthcoming demand. We have assessed the impact of a range of manipulated stressors on diurnal cortisol rhythm.

INSECURE ANXIOUS ATTACHMENT STYLE PREDICTS AN ENHANCED CORTISOL RESPONSE TO GROUP STRESS
Angela Clow
Anxious attachment style is associated with poor health but links with stress reactivity are not clear. Using the TSST for groups we show increased HPA axis activation and sustained perceived stress compared to secure and avoidant attachment style.

**TYPE D (DISTRESSED) PERSONALITY AND PSYCHOBIOLOGICAL STRESS REACTIVITY**

*Michael Smith*

This talk will present a series of studies in which we have been investigating the relationship between Type D (distressed) personality and i) cardiovascular responses to stress, and ii) basal secretion of the stress hormone cortisol.

**THE PSYCHOBIOLOGY OF FACING LIFE THREATENING SITUATIONS – THE IMPACT ON COGNITION**

*Sarita Robinson*

This paper will outline a series of studies undertaken to examine the impact of acute stress on cognition. The paper will also consider the effects of individual differences and nutritional interventions on trauma resilience.
**PS082**

**UNDERLYING MECHANISMS OF EXTERNALIZING AND SOCIAL BEHAVIOUR PROBLEMS IN ADOLESCENCE**

B14. Development and education - Developmental disorders in health

Convenor
Kirsten Smeets, Karakter Child and Adolescent Psychiatry, Nijmegen - Netherlands

Presenters
Kirsten Smeets, Karakter Child and Adolescent Psychiatry, Nijmegen - Netherlands
Mireille Bakker, Donders Institute for Brain, Cognition and Behaviour, Nijmegen - Netherlands
Jennifer Richards, Donders Institute for Brain, Cognition and Behaviour, Nijmegen - Netherlands
Anoek Oerlemans, Donders Institute for Brain, Cognition and Behaviour, Nijmegen - Netherlands

Discussant
Floor Scheepers, Rudolf Magnus Institute of Neuroscience, Utrecht - Netherlands

Developmental disorders are often characterized by externalizing and social behaviour problems. Maladaptive aggression and antisocial behaviours are reported in attention-deficit/hyperactivity disorder (ADHD), oppositional defiant disorders (ODD), and conduct disorders (CD). Lack of empathy, poorer emotion recognition, and impaired prosocial behaviour is often reported in autism spectrum disorders (ASD) and CD. There is a need for information on multiple aspects of the origins in these affected behaviours. Examining causal mechanisms for externalizing and social behaviour problems has been difficult, partly because of the large within-disorder and between-disorder heterogeneity of these behaviours (e.g. one person with emotion recognition problems might develop conduct problems, whereas the other person develops autistic problems or no problematic behaviour). This symposium integrates novel insights into the underpinnings of social behaviour problems and related traits (e.g. autistic spectrum traits, attention deficits and hyperactivity problems, oppositional behaviour problems and delinquent or conduct problems) using a complementary array of research designs and methodological approaches (gene-environment interactions and parenting effects, psychobiological markers, and person-cantered research).

**CAN PROACTIVE AND REACTIVE AGGRESSION BE DISTINGUISHED AS DIFFERENT SUBTYPES OF AGGRESSION IN ADOLESCENTS? A VARIABLE- AND PERSON-BASED APPROACH**

*Kirsten Smeets*

Literature is inconsistent as to whether proactive and reactive aggression can be separated or not. The aim of this study was to examine the possible distinction of proactive and reactive aggression and determine the underlying behavioural profiles. Results show that proactive and reactive aggression can be distinguished, however proactive aggression does not seem to occur in the absence of reactive aggression. Furthermore, reactive aggression seems to encompass a form of internal frustration and external provocation. Contrary to previous studies, aggression factors and classes were not differentially associated with other mental health problems and mainly driven by overall severity rather than subtype of aggression.

**THE ROLE OF TESTOSTERONE, CORTISOL AND OXYTOCINE IN CHILDREN AND ADOLESCENTS WITH DISRUPTIVE BEHAVIOUR DISORDERS**

*Mireille Bakker*

This research is focused on hormonal values within a sample of children and adolescents with disruptive behaviour disorders (DBD). High values of testosterone are connected to a decrease in
empathic skills, which in turn is connected to aggression or antisocial behaviour. In contrast, it is proposed that cortisol has a modulating effect on this. In addition, since both empathy and oxytocine are connected to social functioning there may be a role for oxytocine on empathic processes. Outcomes are explored within different subtypes of aggression and level of callous unemotional traits.

**ADOLESCENT BEHAVIOURAL AND NEURAL REWARD PROCESSING: A TEST OF THE DIFFERENTIAL SUSCEPTIBILITY THEORY**

*Jennifer Richards*

While extremes in reward sensitivity can lead to maladaptive behaviour, little is known about its genetic and environmental background. To improve our understanding of individual differences in reward sensitivity, we tested the differential susceptibility theory, which states that individuals carrying plasticity gene variants will be more disadvantaged in negative, but more advantaged in positive environments. Behavioural and neural responses to rewards were assessed during a monetary incentive delay (MID) task in adolescents with and without Attention-Deficit/Hyperactivity Disorder (ADHD). We found evidence for differential genetic susceptibility toward positive social environments for both behavioural and striatal reward sensitivity. Evidence was also found in favor of cumulative genetic plasticity toward negative environmental effects for general task performance.

**LONGITUDINAL, RECIPROCAL RELATIONSHIPS BETWEEN AUTISM SPECTRUM DISORDER TRAITS AND PROSOCIAL BEHAVIOUR IN ADOLESCENCE. THE TRAILS STUDY**

*Anoek Oerlemans*

Disorders on the autism spectrum (ASDs), or autistic traits, have been associated with deficits in prosocial behaviour. The current study investigates the longitudinal relationships between autistic traits and prosocial behaviour in early to late adolescence. Results show that ASD and prosocial traits were fairly stable over time. In addition, small cross-lagged effects indicate that worse prosocial behaviour predicts poorer ASD outcomes (i.e. more traits) at a subsequent time-point, and vice versa.
ATTITUDES TOWARD SAME-SEX MARRIAGE AND GAY/LESBIAN PARENTING ACROSS EUROPE

The legality of same-sex marriage (SSM) and gay or lesbian parenting (GLP) has been an object of controversy in many European countries. Besides these important civil and legal recognitions, how attitudes toward SSM and GLP are changing is an important question not only for psychologists but for the formation of public policy and for political decisions as well. Previous research has only shown the correlated variables of positive and negative attitudes toward SSM. No European research has studied correlates of positive and negative attitudes towards SSM and GLP. In the framework of this symposium we will present results coming from a huge cross-national research comparing heterosexual’s attitudes of 18000 students across 7 European countries (Belgium, France, Greece, Italy, Poland, Portugal, and Spain).

The sample involved between 300 and 1000 participants for each participant country. Half of the sample involved heterosexual females and the other half heterosexual males. All participants were from 18 to 25 years old. Up to one-third of the students from each country were to be from the Social Sciences, but at least two-thirds of all participants must come from others faculties. The survey questions were administered anonymously online through the internet and with encryption to ensure complete security of the data gathered. This research is important in order to gauge what attitudes are prevalent in the selected countries and also to understand the sources of resistance to the quest for same-sex marriage and lesbian/gay parenting rights. After this first presentation, results from three contrasted countries (Greece, Poland and Spain) in term of civil rights and socio-political situation will be presented. The findings of these cross-national and national studies may be important not only for scholars but also for the formation of public policy to enhance the well-being of lesbian and gay populations across Europe.

ATTITUDES TOWARD GAY AND LESBIAN COUPLES AND PARENTS IN SPAIN

Marta Evelia Aparicio-García, Béatriz Fernández-Castilla

The results show that two variables are really important when predicting a greater support toward homosexuals: political ideology and importance of religion. Having contact with homosexuals and specially being satisfied with emerge as key factors in predicting support from same-sex marriage, homosexual parenting and positive attitudes toward them.

ATTITUDES TOWARDS SAME SEX MARRIAGE AND GAY AND LESBIAN PARENTING AMONG GREEK STUDENTS

Klio Geroulanou
This presentation will focus on the Greek sample’s results, particularities, and implications. Main findings indicate that male gender, religiosity and political conservatism are most related to negative attitudes towards homosexuality, same sex marriage and parenting. Other correlates to these variables will also be discussed in detail.

ATTITUDES TOWARDS SAME-SEX MARRIAGE AND PARENTING IN POLAND
Marta Dora, Magda Mijas
Despite ongoing social changes resulting in broadening the definition of family, same-sex marriage and lesbian or gay parenting are objects of controversy in many European countries, with Poland taking lead. The analysis of over 660 surveys has shown a great homogeneity of the sample with gender and religiosity as main predictors of the attitudes.

ATTITUDES TOWARD GAY AND LESBIAN MARRIAGE AND PARENTING ACROSS SEVEN EUROPEAN COUNTRIES
Salvatore D’Amore, Robert-Jay Green, Katie Katuzny, Thérèse Scali, Roberto Baiocco, Olivier Vecho, Pedro Alexandre Nuno da Costa, Magdalena Mijas, Marta Evelia Aparicio, Klio Geroulanou
This study (N=13,373) shows that attitudes toward same-sex marriage and gay and lesbian parenting across seven European countries are associated with participant’s country of residence, sex, number of LGBT people in social network, religiosity, belief in traditional gender roles, and satisfaction in social relationships with LGBT people.
PS084
A PROACTIVE APPROACH TO ORGANIZATIONS: IMPACT OF POSITIVE ORGANIZATIONAL BEHAVIOR ON WELL-BEING AT WORK

Since decades, OB scholars have focused on exploring negative behaviour at workplace, such as burnout, depersonalization, and absenteeism. Recent evidences, however, lay emphasis on the effects of positive (proactive) organizational behaviour like positive emotions, flow, hope, and optimism. This new perspective of ‘positive organizational behaviour’ (Luthans, 2002) argues that it is very unlikely that presence of same factor will lead to satisfaction and absence to dissatisfaction. Therefore, it is essential to explore positive (proactive) organizational behaviour distinctly, instead of considering it opposite to negative organizational behaviour. This may contribute as an alternative to the traditional reactive approach of studying behaviour in an organizational context. Several POB studies show that studying positive organizational behaviour gives a comprehensive understanding of the variance in organizational outcomes (Bakker & Schaufeli, 2008).

The primary objective of this symposium is to integrate some recent work on positive organizational behaviour from different contexts. The four studies presented in this symposium, carried out in three different geographical locations, tested through experimental and survey designs, highlight the significance of positive organizational behaviour. Holistically, they explain how employees can become more proactive, energetic, dedicated, and absorbed by their work. The discussion triggered by this symposium will aim at developing a holistic understanding of the place where we work and live by focusing both on reactive and positive aspects of it.

The proposed symposium serves to achieve two objectives. First, we highlight the impact of positive organizational behaviour at employee and organizational level. Second, we integrate the findings and propose a framework for future research.

JOB CRAFTING PREDICTS WORK ENGAGEMENT: THE MODERATING ROLE OF WELL-BEING AND EXTRAVERSION

Findings from a Malaysian sample indicates that positive job crafting-engagement link is more enhanced when negative affect is high; and when low flourishing combines with high extraversion. Implications on how low well-being can be harnessed to stimulate employee engagement are discussed.

DOES FEELING POSITIVE CONTRIBUTES TO WELL BEING AT WORK?
Papri Nath
A study on 511 Indian school teachers shows that positive experiences at work predict greater well-being through building psychological resilience. Moreover, structural equations reveal that emotional intelligence moderates the impact of positive emotions on psychological resilience. The study has implications in designing human resource development programs.

THE RELATION BETWEEN PERSONALITY TRAITS AND PSYCHOLOGICAL CAPITAL WITH FLOW AND ENGAGEMENT IN ARGENTINEAN EMPLOYEES
Belén Mesurado
The purpose of this study is to investigate the relationship between the Big Five factors of personality and Psychological Capital with flow and engagement in Argentinean employees. The results of SEM showed that the theoretical model fit the data very well. The role of personality and capital psychology in the prediction of flow and engagement in work setting is discussed.

MOOD AND SELF-EFFICACY: HEDONIC AND UTILITARIAN MOTIVATION AS MODERATORS
Abhishek Totawar, Ranjeet Nambudiri
A four-quadrant framework is developed and tested to examine the causal influence of mood on self-efficacy with hedonic and utilitarian motivation moderating this relationship. A quasiexperimental design is followed with three mood states experimentally induced across six groups. Results and implications are discussed in the organizational context.

FRAMEWORK FOR FUTURE RESEARCH
Ranjeet Nambudiri
We conclude this symposium by synthesizing findings from the four studies. It is expected that such synthesis and integration will provide useful guidelines for future research in the arena of POB.
PS085
IMPROVING SOCIAL WELL-BEING AND SUSTAINABLE DEVELOPMENT: THE UNITED NATION AGENDA BEYOND 2015

D09. Work and organization - Sustainable development and corporate social responsibility

Convenor Pamela Bernabei, Economic and Social Council (ECOSOC) of the United Nations, Rome - Italy

Presenters Pamela Bernabei, Economic and Social Council (ECOSOC) of the United Nations, Rome - Italy
Veronica Odintsova, Saint Petersburg State University, Saint Petersburg - Russian Federation
Gabriella Palumbo, Italian National Health Institute, Rome - Italy
Margherita Carotenuto, AEO, Unit of sustainable development and training, Milan - Italy

Discussant Marina Capasso, Sapienza University of Rome, Rome - Italy

Looking beyond the Millennium Development Goals (MDGs), the United Nation (UN) sustainable development agenda for the period after 2015 is addressing new challenges facing people and planet: improving economic and social well-being while protecting the environment, and address issues including growth, equality, peace and security, governance and human rights. It must constitute global transformational change for people and planet, with common, shared responsibilities for all countries, recognizing that countries have different capabilities. The goal is “simple but daunting - prosperity and dignity for all in a world where humankind lives in harmony with nature”.

So, if responsibility and reciprocity are in synergy, can people and the planet live together happily? And, when arguing about ‘sustainable human relations’, ‘social responsibility’, organizations and sustainability are we discussing about theory or practice? The aim of the Symposium is to try to give answers to this challenge. The speakers, all involved in various committees and working groups that address global problems, will describe the activities and the realization for the implementation of the MDGs in regional areas of Europe and Russian Federation: from poor and abandoned places to sustainable ecobiological projects and centres of humanistic art and culture. In particular, the responsibility of young university students, involved in the projects, to achieve goals 2 (i.e. achieving universal primary education), 7 (i.e. ensuring environmental sustainability), 8 (i.e. global partnership for development) will be highlighted. Thus, projects that place human being at the centre of sustainable development: education, civilization, which then bear the result of economic prosperity and psychological well-being. Finally the results concerning “Civilization in progress, through cultural diversity and MDGs achievement” (under the high level segment of the Economic and Social Council of UN) will be discussed.

CULTURAL DIVERSITY AS A DRIVING FORCE FOR ALL MANKIND

Pamela Bernabei

Cultural barrier has been the most difficult to manage. This is why the focus of the paper is on the state of art on tools for training young people and entrepreneurship with its additional components of corporate social responsibility (CSR).
ENVIRONMENTAL EDUCATION AND SOCIAL RESPONSIBILITY
Veronika Odintsova
To promote environmental education and social responsibility, the faculty of psychology of St. Petersburg University is running training courses on interaction between physical space and person-friendly environment. Results are discussed.

CIVILIZATIONS IN PROGRESS AND LOCAL SUSTAINABLE DEVELOPMENT
Gabriella Palumbo
Results of programme “Civilization in progress, through cultural diversity and MDGs achievement” (at Lizori, under the high level segment of ECOSOC of UN) and its restoration as an ecobiological sustainable development pilot example is discussed.

THE REAL HUMAN CULTURE AS GUARANTEE OF CULTURAL DIVERSITIES AND SUSTAINABILITY
Margherita Carotenuto
Beyond many differences between cultures, civilizations, forms of society, there is a common foundation. This “common denominator” can be identified and described to evolve healthy individuals and sustainable coexistence forms.
PS086
LESGIAN AND GAY PARENTS IN THE SOCIAL CONTEXT: “WHAT THEY THINK WE ARE. WHAT WE ACTUALLY ARE”

C04. Culture and society - LGBTQI studies

Convenor  Nicola Nardelli, Sapienza University of Rome, Rome - Italy
Presenters  Roberto Baiocco, Sapienza University of Rome, Rome - Italy
            Paolo Roberto Pagone, University of Padova, Padua - Italy
            Marina Miscioscia, University of Liège, Liège - Belgium
            Victor Figueroa, University of London, London - United Kingdom
Discussant  Vittorio Lingiardi, Sapienza University of Rome, Rome - Italy

Studies regarding parenting by lesbians and gay men belong to a branch of research started about 40 years ago. Several studies have investigated the parental capability of lesbians and gay men and the consequent development of their children. Research has mostly focused on lesbian mothers that have conceived during previous opposite-sex relationships. In addition, there are studies about biological gay fathers, gay and lesbian couples with adoptive children, and children born via medically assisted procreation (MAP; i.e., surrogacy or insemination by donor). There have been various foci of research, but two macro-categories can be noticed: on the one hand, there are studies about differences and similarities between the parental skills of opposite-sex parents and same-sex parents; on the other hand, there are studies about the outcome of children raised by lesbian and gay parents referring to the sexual, social, psychological, and cognitive development compared with peers from heterosexual parents. Overall, results demonstrated how lesbians and gay men could be good parents in child rearing, caregiving ability, division of labour, and parental skills. Simultaneously, researchers studied the other side of the coin: the discriminatory social context in which lesbian and gay parents and their children live (or even the desire of lesbians and gay men to become parents). The legal standards concerning same-sex marriage and the opportunity for gay men and lesbians to raise children differ within the European legal scenario. Nevertheless, lesbians and gay men have to face prejudices perpetuated against them, not only as citizens but also as parents, regardless of the State they live in. What are the attitudes towards lesbian and gay parents, and the wellbeing of their children? How can we prevent the prejudices against them? What are the challenges addressed by them? The aim of this symposium is to contribute to answering these important questions, presenting four studies that have used qualitative and quantitative methods. Hereupon, we want to merge these two distinct themes to provide a rounded overview of a concern that restricts specific people’s civil rights because of their sexual orientation.

ATTITUDES TOWARD GAY AND LESBIAN COUPLES AND PARENTS IN ITALY
Roberto Baiocco, Salvatore D’Amore, Robert-Jay Green, S. Ioverno, S. Mazzoni, Vittorio Lingiardi
This study aims at examining the correlated variables of positive and negative attitudes toward same-sex marriage and parenting in Italy where LGBT having different recognition levels about their civil and parental rights.

REDUCING UNIVERSITY STUDENTS’ ATTITUDES TOWARDS LESBIANS AND GAY MEN AS PARENTS: A COMPARISON BETWEEN IMPLICIT AND EXPLICIT PREJUDICE
Paolo Roberto Pagone, Nicola Nardelli, Roberto Baiocco, S. Ioverno, A. Simonelli, Vittorio Lingiardi
Aim of this study is to evaluate reduction of negative attitudes towards lesbian and gay parents among university students through teaching. Both implicit and explicit prejudice are assessed.

COPARENTING ACROSS TRANSITION TO PARENTHOOD IN LESBIAN-HEADED FAMILIES: TWO CASE STUDIES  
Marina Miscioscia, A. Simonelli, J.M. Gauthier  
In this presentation we observe coparenting across the transition to parenthood in two lesbian-headed families. Coparenting will be assessed by using the Lausanne Trilogue Play approach at time 1 (during pregnancy) and time 2 (3 months after birth).

THE IDENTITY LIFE COURSE OF CHILEAN LESBIAN WOMEN BECOMING MOTHERS FROM HETEROSEXUAL RELATIONSHIPS  
Victor Figueroa, F. Tasker  
Lesbian mothers living in Latino countries encounter different challenges due to the traditional expectations for parenting and family formation of their societies. This study explored the coming out process of 13 lesbian mothers living in Chile.
PS087
RESILIENCE ACROSS CULTURES: USE OF THE DEVEREUX EARLY CHILDHOOD ASSESSMENT FOR PRESCHOOLERS AND DEVEREUX STUDENT STRENGTHS ASSESSMENT IN PROMOTING RESILIENCE

E09. Health and clinical intervention - Positivity and well-being

Convenor
Jack A. Naglieri, University of Virginia, Charlottesville; Devereux Center for Resilient Children, Villanova - United States

Presenters
Ignazio Ardizzone, Sapienza University of Rome, Rome - Italy
Francesca Santoro, Sapienza University of Rome, Rome - Italy
Sara Panunzi, Sapienza University of Rome, Rome - Italy
Serena Galosi, Sapienza University of Rome, Rome - Italy
David-Jan Punt, Hogrefe Uitgevers, Amsterdam - Netherlands
Matteo Ciancaleoni, Hogrefe Editore, Florence - Italy

The evaluation of factors related to resilience has become a key component to the positive psychology movement, sometimes referred to as Social Emotional Learning (SEL) in the United States. SEL skills are substantially developed through social learning contexts and theoretically linked to the frontal lobes. Measurement of SEL skills is essential if psychologists and educators are to ensure the development of healthy social-emotional skills. This session will begin with a description of the Devereux Early Childhood Assessment for Preschoolers (DECAP2) and the Devereux Student strengths Assessment (DESSA) published in the U.S. This will include the theoretical rationale for the scales, their psychometric qualities, and application of these rating scales for promoting resilience. Next, the research on the two versions that have been developed in the Netherlands and Italy will be described. Finally, application of these tools for the promotion of resilience in clinical practice will be provided.

ADAPTATION OF DESSA QUESTIONNAIRE: A CROSS-CULTURAL STUDY
David-Jan Punt, Matteo Ciancaleoni
The DESSA is an USA questionnaire adapted in the Netherlands and Italy. The aim of the study was to assess the cross-cultural differences of the test across these countries. It was administered to parents and teachers to evaluate both versions.

PROMOTING RESILIENCE: DESSA AND DECA-P2 IN ACTION
Ignazio Ardizzone, Francesca Santoro, Sara Panunzi, Serena Galosi
The authors through clinical examples show the effectiveness of Devereux Early Childhood Assessment for Preschoolers second Edition and the Devereux Student strengths Assessment-K-8th Grade in Promoting resilience and preventing child and adolescent psychopathology. The authors also stress the potential of the two tests in giving information on the normal and pathological development of personality highlighting an additional and useful of DESSA and DECA in the study of precursors of personality disorders.
PS088
ENHANCING SPATIAL ABILITIES THROUGH MOTOR PRACTICE

A12. General Issues and basic processes - Intelligence and cognitive functioning

Convenor Angelica Moè, University of Padova, Padua - Italy
Presenters Wenke Möhring, University of Fribourg, Fribourg - Switzerland
Petra Jansen, University of Regensburg, Regensburg - Germany
Francesca Pazzaglia, University of Padova, Padua - Italy
Jérémy Clerc, University of Lille 3, Villeneuve d’Ascq - France
Discussant Attilio Carraro, University of Padova, Padua - Italy

The ability to rotate 3-D objects in the space is fundamental when performing many everyday tasks such as finding one’s way in a new environment, finding the shortest way to reach a place, as well as succeeding in learning many academic subjects ranging from geometry to physics or chemistry to the extent that it predicts the choice of STEM careers and professions (Wai, Lubinski, & Benbow, 2009). Until now research has outlined that a) many biological, cultural, motivational, and experiential factors influence the ability to rotate correctly and fast, b) men outperform women in mental rotation (e.g., Halpern et al., 2007). There is also evidence that the ability to mentally rotate objects can be improved in many ways ranging from playing action video-games, solving mental rotation items or sketching 3-D objects, engaging in spatial tasks, being included in an academic program which involves spatial manipulations or representation, reducing stereotype threats, attributing performance to effort (e.g., Uttal et al., 2013).

This symposium will focus on a way of improving mental rotation abilities: motor practice. The beneficial effects of motor experiences, manipulation of objects, sports practice, dance, and physical activities on mental rotation ability will be presented through studies conducted in four different European countries focusing on populations ranging from 6 months to adulthood. These activities involving motor practice performed over the years would result in a sort of long-lasting and continuous training of overall spatial abilities and mental rotation, in particular, which could have beneficial effects on both cognitive performance (mainly the ability to represent and manipulate objects) and health (overall beneficial effects of physical activity). Factors such as expertise, involvement, characteristics of the motor experience provided will be considered. The discussion will focus on the role of the mental representation of movement in the development of mental rotation abilities in both genders, and on the motivational aspects which could favour the engagement in activities which boost mental rotation and spatial thinking.

EARLY EFFECTS OF MOTOR EXPERIENCE ON INFANT’S MENTAL ROTATION
Wenke Möhring, Andrea Frick
The role of motor experience for infants’ mental rotation ability was investigated using the violation-of-expectation paradigm. At 6 months of age, infant’s mental rotation performance was improved by prior manual experience, at 8-10 months performance was correlated to motor experience.

THE IMPROVEMENT OF MENTAL ROTATION PERFORMANCE IN SECOND GRADERS AFTER LONG-TERM AND SHORT-TERM CREATIVE DANCE TRAINING
Petra Jansen
Two studies examined the beneficial effects of dance training. An increase in performance in mental rotation was observed after five weeks of dance lessons and even after one lesson, but not after normal physical education lessons.

**EFFECTS OF EXPERTISE IN MENTAL ROTATION PERFORMANCE**  
*Francesca Pazzaglia, Angelica Moë, Beatrice Benelli*

Studies outlining the effects of expertise in adults practicing sports or physical activities at a regular basis will be presented. Research showing that professionals perform better in mental rotation than beginners, and that gender differences maintain but reduce with increasing practice will be discussed.

**STRATEGIES WHICH ENABLES TRANSFER OF MOTOR PRACTICE INTO COGNITIVE ABILITIES**  
*Jérôme Clerc*

I will resume my past research showing positive effects of motor practice on cognitive abilities, including mental rotation and memory for order. I will stress the need of considering individual strategies people make use of when transferring motor practice to non-motor cognitive tasks.
In order to introduce the concept of psychological triage, it’s important to consider that it represents the first instance of welcoming and evaluation of the patients on the basis of precise criteria that make it possible to establish a priority of intervention. We can basically say that psychological triage is a first-welcoming and first-evaluation intervention for the victims of the event, in which, through a receptive-evaluative-decisional process based on pre-defined criteria, we welcome the person, evaluate their need for psychological help, identify how postponable the treatment is and determine the person’s access to psychological care assigning them to a specific priority class. The higher the class, the more timely the treatment is going to be. Psychological triage - therefore - is an act, or more specifically a receptive-evaluative-decisional process, enacted through pre-established criteria and methods, articulated in sequential well defined phases:

a) reception  
b) recognition of signs and symptoms  
c) attribution of a priority code

On a practical and concrete level, we can say that psychological triage is the process through which we can assess the urgency for a specific subject to receive and perceive psychological sustainment in that precise moment.

It should be noted that the psychological triage should not be considered an act or a psychodiagnostic process. The psychological triage tends to evaluate whether there is need for psychological support and how urgent. The psychodiagnostic, instead, tends to describe traits and mechanism of psychic functioning. The psychodiagnostic aims to establish a framework psychic, the psychological triage is intended to protect the psychological status of person.

GOALS OF PSYCHOLOGICAL TRIAGE  
*Angelo Napoli*

Psychological triage tends to evaluate the need for psychological care and the urgency of it, using standardized criteria and procedures that are shared and uniform.
Starting with psychological reactions to critical events and addressing issues related to the assessment of psychological impact, the presentation will focus on goals, procedures and tools of psychological triage.

THE NEED FOR PSYCHOLOGICAL TRIAGE INTERVENTION
Anna Palumbo
Studying, experimenting and enacting the process of psychological triage is the only way to distinguish, in situations of mass emergency, between the victims who need immediate psychological care and those for which treatment can be postponed.

CRITERIA FOR THE ENACTMENT OF PSYCHOLOGICAL TRIAGE
Isabella Cinquegrana
Psychological triage is enacted through the use of criteria on the basis of which operators assign subjects to treatment classes. Such priority classes are: low priority (PSI 1), medium priority (PSI 2), high priority (PSI 3).

ADMINISTERING THE PSYCHOLOGICAL TRIAGE FORM
Michele Cusano
The psychological triage form is to be considered a rapid and effective instrument for the retrieval of all necessary information, the assessment of the subject’s need for psychological care and the preservation and study of all collected information. Therefore, particular importance is due to the properly filling the form and interpreting the elements that constitute it.
PS090
ISSUES AND POSSIBILITIES OF MORAL ACTING RESEARCH

B05. Development and education - Moral development and prosocial behaviour

Convenor Marek Preiss, University of New York, Prague - Czech Republic
Presenters Iva Stuchlíková, University of South Bohemia, České Budějovice - Czech Republic
Marek Preiss, University of New York, Prague - Czech Republic
Tereza Příhodová, Prague Psychiatric Center; National Institute of Mental Health, Prague - María Luisa Vecina, Complutense University of Madrid, Madrid - Spain
Alena Nohavová, University of South Bohemia, České Budějovice - Czech Republic

The moral acting is a various concept, which may be studied through many approaches. Authors of the symposium try to point out, define and account for some of these approaches. The main objective of the symposium is a broader interdisciplinary reflection on moral acting, focusing on psychological, clinical and philosophical perspective. We present findings from the ethical perspectives using different populations and settings, university students and healthy subjects. Our focus carries from philosophy over to measuring honesty and cheating; moral emotions, moral reasoning and ethics of university students; coping strategies for academic dishonesty; and measuring honesty.

Nonetheless, the assumption of a shared meaning of academic cheating is not usually verified and it may introduce an extra measurement error, especially when items are decontextualized. The anchoring vignettes methods may help to solve the problem by letting respondents evaluate both their situations, as well as hypothetical situations happening to other people (anchoring vignette).

Like a moral vignette or dilemmas we could use for the research of morality an event that actually happened. Consequently, we considered measuring morality through the responsibility for the plane crash of Malaysian Boeing 777 on July 17th,2014. Using this approach we usually assess someone’s morality by knowing just his behavior. Majority of psychological research about morality/ethical dilemmas, uses information about behavior as the most common type of assessment. However, the latest research also underlined the role of emotions in morality, apart from the cognitive area. In conclusion, with this study we would like to start the reflection concerning the impact of different types of information about others on our subjective image of their morality. Aside from events we may show an interest in prevalent social problem. We may emphasize a family violence, the problem that has been traditionally treated as a gender-related issue.

Many of these moral terms seem to be linked under the umbrella of the moral integrity notion. The development and use of integrity testing has substantially risen in the recent years. This phenomenon occurred thanks to the increased numbers of dishonest behaviors across academia, as well as across variety of working environments, where employers more often reach out to these instruments to screen their potential future employees.

Because the subject of research is morality, we often face the issue that is usually called the validity problem. We found that involved subjects have a tendency to follow and interpret moral stories too much unlikely. These differences then affect and set up subject to answer questionnaires in a random and confused manner. In order to find out why this occurs, we need to examine morality in a more fundamental way.

STUDENTS’ MORAL EMOTIONS AND THE EVALUATION OF ACADEMIC CHEATING/DECEPTION SITUATIONS – THE ADVANTAGE OF ANCHORING VIGNETTES
**Iva Stuchlíková, Jana Vrbová**

The paper deals with the process of developing vignettes that help to place moral emotions into appropriate context within the academic environment. We started with a survey assessing particular situations in which the students felt moral emotions.

**PLANE CRASH OF MALAYSIAN BOEING 777 – ASSESSMENT OF OFFENDER’S MORALITY**

*Marek Preiss, Mariola Paruzel-Czachura, Michał Brol, Tereza Příhodová, David Krámský, María Luisa Vecina, Fei Cheng*

The aim of our presentation is to introduce our research connected with the assessment of morality of a person (group) responsible for the plane crash of Malaysian Boeing 777 on July 17th, 2014. In our research we used the three aspects model in the sphere of morality: behavior, emotions and views.

**INTRODUCTION OF AN ORIGINAL AND NEWLY DEVELOPED INTEGRITY MEASURE**

*Tereza Příhodová, Marek Preiss, David Krámský, Lenka Krámská*

The presented pilot study and standardization study introduces an original measure of integrity. In this work, there are two poles standing against each other, one being integrity, as a complex construct encountering more than a traditional concept of honesty and on the other side counter productive work behavior, as a behavior harming the employer.

**SACREDNESS OF THE FIVE MORAL FOUNDATIONS IN MEN IN COURT-MANDATED PSYCHOLOGICAL TREATMENT FOR ABUSING THEIR PARTNERS**

*Maria Luisa Vecina, Daniela Marzana, Mariola Paruzel-Czachura*

Intimate partner violence constitutes a serious social problem that has traditionally been treated as a gender-related issue or as one aspect of the larger issue of family violence. This characterization is compatible with the assumption that a sacred moral world is threatened by reality, which may be associated with violent defensive reactions.

**VALIDITY PROBLEM OF MORAL REASONING TEST IN REGARDS TO THE THEORY OF ONE/THIRD PERSPECTIVE**

*Alena Nohavová, David Krámský*

As a major aspect of moral reasoning the paper finds the engagement and the involvement to interpret the moral issues either from the one person perspective or the third person perspective, as well as the theory of psychical distance. Consequently, the paper tries to account for these perspective issues in line with the Kohlberg’s theory.
PS091
NEW DIRECTION OF SELF-CONTROL (AS A JIKO-CONTROL) OF DOHSA-HOU (JAPANESE ORIGINAL PSYCHOTHERAPY USING BODY-MOVEMENT TECHNIQUE)

E11. Health and clinical intervention - Lifestyles and healthy self-regulation

Convenor Yutaka Haramaki, Kagoshima University, Kagoshima - Japan
Presenters Osamu Imura, Osaka University, Osaka - Japan
Eiji Ozawa, Kagoshima University, Kagoshima - Japan
Airi Zamami, Nagasaki Junior College, Nagasaki - Japan
Yutaka Haramaki, Kagoshima University, Kagoshima - Japan
Discussant Susumu Harizuka, Nakamura Gakuen University, Fukuoka - Japan

A Japanese psycho-therapeutic method “Dohsa-Hou” has been developed for more than 45 years in Japan. Initially, the method has been developed for the people with cerebral palsy to improve their bodily movements by Professor Gosaku Naruse and his colleagues. And then the method has been applied to the people with developmental disorders. Now a day in Japan, the clinical psychologists use Dohsa-Hou as a psychotherapeutic method for the various kind patients at the medical center, mental hospital, the mental clinic and the institution for disabled people (ex. psycho-somatic patients, paediatric patients, schizophrenia, depressive disorder, autistic spectrum disorder, ADHD and LD children).

“Dohsa” is a Japanese special word and it means a holistic process of motor action which consists of the psychological process and bodily movement process. The psychological process of Dohsa consists of «intention» and «striving». So, the aims of Dohsa-Hou as a psychotherapy is to support the patients to control their mind and body (movement). In other words, Dohsa-Hou might help the patients to integrate their mind and body by themselves. In this symposium, we would like to introduce to Dohsa-Hou (Japanese psychotherapy) and to report the latest studies of Dohsa-Hou, and to discuss the new viewpoints of psychotherapy which integrates mind and body with participants of this symposium.

INTRODUCTION TO DOHSA-HOU
Osamu Imura

Dohsa-Hou is a unique body-oriented approach which has developed in Japan for children with disabilities and patients with mental disorders. The history, theory and techniques will be introduced.

JIKO-CONTROL FOR PEOPLE WITH DEVELOPMENTAL DISORDERS
Eiji Ozawa

People with developmental disorders often have self-control problems such as impulsivity or repetitive behavior. Many studies indicate Dohsa-Hou improves self-awareness and social interaction. This presentation introduces therapeutic techniques.

JIKO-CONTROL EXPERIENCE FOR STUDENT WITH OBSESSIVE-COMPULSIVE
Airi Zamami
JIKO-control experience for Obsessive–compulsive is effective in regulation of anxiety and anger. To compare with Yoga, Dohsa-Hou has therapist-confronting experience and therapeutic personal relationship for client.

JIKO-CONTROL FOR CHRONIC PAIN PATIENTS
Yutaka Haramaki
Chronic pain patients keep suppressing and inhibition of their emotion and behavior because of their pain. Dohsa-Hou makes the patients activate self-care to manage their conditions by intentional exercise.

PS092
INTELLECTUAL DISABILITY BETWEEN NEW CHALLENGES, GOOD PRACTICES AND INNOVATIVE ANALYSIS SYSTEMS

Individuals with intellectual disability (ID) are now living longer with the majority of individuals reaching middle and even “old age.” As a consequence of this extended longevity they are vulnerable to the same age associated health problems as elderly adults in the general population without ID. This includes dementia, a general term referring to a variety of diseases and conditions causing a substantial loss of cognitive ability and functional declines; adults with Down syndrome are at especially high risk.

A great deal of recent effort has focused on the very earliest detectable indicators of decline (and even prodromal stages of dementia causing diseases). Therefore, it would be very useful to assess a possible decrease in the level of personal efficiency in the course of time, through the determination of a baseline that delineates the highest level of lifespan functioning reached by the person with ID.

In this way it could be easier to capture which cognitive deficits are to be considered a primary outcome of aging dependent ID and which, instead, are signs of a further impairment secondary to an (incipient) neurodegenerative dementia that is associated by definition with a slowly progressive loss of previously possessed skills.

Pertinent to this context there is another complex and emerging challenge posed by issues related to autism.

Both of these challenges demand new tools, new analysis capabilities and best practices that should be implemented in the general health services.
In this symposium we would like to propose two research that led to the psychometric validation of new tools for the Italian context (DSQIID and AFAST), the development of rational good practice in the management and assessment of aging in intellectual disability (Sospiro and ULSS 10) and an exemplification of the use of some Artificial Neural Networks (ANN) and new processos of data mining to analyze data and introducing the potential of these innovative tools applied to a complex field of inquiry like Autism and the functional assessment in people with ID and dementia.

**DSQIID**  
*Luigi Croce*  
A multicentre validation study in aging adults with Down syndrome (DS) and other forms of Intellectual Disabilities of the Dementia Screening Questionnaire for Individuals with Intellectual Disabilities. This study confirms the cross-cultural value of DSQIID which is a valid and user-friendly observer-rated scale for cognitive screening in persons with DS aged 40 years and over and in individuals with ID non-DS with age of 50 years and older.

**DEMENTIA SCREENING IN PEOPLE WITH ID**  
*Giampiero Nardo*  
Case study: data concerning the one year follow-up of a baseline screening for dementia applied to a population of more than 200 persons with the Dementia Questionnaire for Persons with ID (DMR) in a population of eastern Veneto and proposed procedures for access and service activation in a national Health Service (Local Health Unit 10).

**THE ROLE OF ARTIFICIAL NEURAL NETWORKS IN AUTISM RESEARCH**  
*Enzo Grossi*  
The presentation will focus some potential applications of artificial neural networks in research activities on autism ranging from the development of predictive models starting from pregnancy risk factor to the disentangling of EEG chaotic signals to intelligent neuro-imaging.
PS093
IMPLICATIONS OF THE SUCCESSFUL ADVOCACY OF PSYCHOLOGISTS AT THE UNITED NATIONS TO INFLUENCE THE NEW SUSTAINABLE DEVELOPMENT GOALS

F01. Expo 2015 Hot Topics - Capacities building and human development

Convenor Janel Gauthier, Laval University, Quebec City - Canada
Presenters Judy Kuriansky, Columbia University Teachers College, New York - United States
Telmo Mourinho Baptista, Ordem dos Psicólogos Portugueses, Lisbon; Iberoamerican Federation of Psychological Associations (FIAP); Portuguese Association for Behavioral and Cognitive Therapies - Portugal
Wolfgang P. Beiglböeck, Beiglböeck & Feselmayer Consultants, Vienna - Austria
Florence Denmark, Pace University, New York - United States
Discussant José M. Peiró, University of Valencia, Valencia - Spain

In a monumental paradigm shift at the United Nations, mental health and wellbeing is being included in the global agenda. These Sustainable Development Goals list the 17 goals and 169 targets governments will strive to achieve in the years 2015-2030. This is due to the dedicated advocacy of psychologists with member states of the United Nations, and other stakeholders, during meetings of governments determining the framework. Panelists involved in this process will present major impact of this success on the practice and science of psychologists worldwide, and the steps psychologists can and need to do to insure maximal positive impacts on their own work and on the betterment of the planet and people. This advocacy has also impacted the Sendai Framework for Disaster Risk Reduction recently determined in Japan this March. With so many disasters worldwide, including most recently in Vanuatu and in Nepal, the implications to psychologists of this inclusion of mental health in the framework will be discussed.

HOW PSYCHOLOGISTS CAN DO SUCCESSFUL ADVOCACY FOR THEIR WORK
Judy Kuriansky
The steps of the advocacy campaign for inclusion of mental health and wellbeing in the new Sustainable Development Goals will be outlined, including drafting statements and meeting with governments and important stakeholders, to serve as a model for psychologists to advocate in their country, to advance their programmes and research.

MAKING YOUR VOICE KNOWN FROM ALL PARTS OF THE WORLD
Telmo Baptista
This presentation describes how psychologists from all countries can influence the global agenda even when not living in one of the major cities where the United Nations is located, given the presenter’s personal experience of participating in advocacy efforts. How the global agenda impacts all psychologists work worldwide is also presented.

WHAT PSYCHOLOGISTS CAN CONTRIBUTE AT THE UN, THE CASE IN VIENNA
Wolfgang P. Beiglböeck
This presentation focuses on the practical work that an IAAP representative is able to do at a UN office in Europe and how UN committees can be influenced effectively, using examples like global drug abuse prevention. Lessons learned are presented, including networking and using existing NGO structures at the UN.

**HOW PSYCHOLOGISTS CAN IMPACT ISSUES ON THE GLOBAL LEVEL AT THE UN**

Florence Denmark

The presentation describes how psychologists can have a major impact on many issues on the global level, specifically with regard to issues like aging, the family and violence against women, given the presenter’s major roles in committees and conferences about these issues at the United Nations.
PS094
PSYCHOLOGY OF AGGRESSIVE AND HOSTILE BEHAVIOR

B08. Development and education - Bullying and aggression

Convenor Pavel Ermakov, Southern Federal University, Rostov-on-Don - Russian Federation
Presenters Pavel Ermakov, Southern Federal University, Rostov-on-Don - Russian Federation
Olga Fedotova, Southern Federal University, Rostov-on-Don - Russian Federation
Vladimir Kosonogov, University of Murcia, Murcia - Russian Federation
Yuliya Mendzerickaya, Goethe University Frankfurt, Frankfurt am Main - Germany
Irina Abakumova, Southern Federal University, Rostov-on-Don - Russian Federation
Discussant Elena Vorobyeva, Southern Federal University, Rostov-on-Don - Russian Federation

At the symposium will be discussed the problem of hostility as forms of emotionally-charged behavior. The problem of a ratio of the studied subjective reality and its objectively observed analogs is the most important in psychology. The term hostility is used along with concepts aggression and anger. Studying of psychological mechanisms of hostility can open new opportunities for prevention of social aggression and prevention of serious somatic and mental diseases.

Next will be analyzed the features of reflection of aggression in educational books on psychology like "graphic guide". Aggression as tool behavioral reaction of destructive character has the numerous manifestations and theoretical treatments.

At the symposium will be analyzed the recognition of anger depending on temperamental traits. The current study explored the link between temperamental traits and the recognition of anger. Participants watched morph faces which consisted of 100 frames depicting a gradual transition from anger to neutral face and vice versa. Structure of Temperament Questionnaire was used to measure temperamental traits of participants.

The following will be considered display of Anger in Lecturer-Student Interactions at Russian and German Universities. This study aimed to find out the association between cultural dimensions, display rules and such aspects of interpersonal interaction as partner’s gender and degree of situation publicity in the lecturer-student communication.

At the end will be considered the influence of antiterrorist websites on value attitudes of different population groups. The analysis of the basic components of Internet-contents influencing sense-value features of consumers has shown that the processual component defines the dynamics of influence of the most sense-saturated components of the perceiving Internet-content and brings their sense-creating potential up to the level of devitrifying senses of the very user.

HOSTILITY AS FORMS OF EMOTIONALLY-CHARGED BEHAVIOR: FEATURES OF CONCEPT’S TREATMENT
Pavel Ermakov, Olga Fedotova

The problem of a ratio of the studied subjective reality and its objectively observed analogs is the most important in psychology. The term hostility is used along with concepts aggression and anger. Studying of psychological mechanisms of hostility can open new opportunities for prevention of social aggression and prevention of serious somatic and mental diseases.

FEATURES OF REFLECTION OF AGGRESSION IN EDUCATIONAL BOOKS ON PSYCHOLOGY LIKE “GRAPHIC GUIDE”
Olga Fedotova, Pavel Ermakov

232
Aggression as tool behavioral reaction of destructive character has the numerous manifestations and theoretical treatments. A projection of a visual image of aggressive behavior in the book Niegel C. Benson "Psychology. A graphic guide to your mind and behavior" (Cambridge, 2007) allows the person who is interested in psychology to get acquainted with manifestations of aggression.

RECOGNITION OF ANGER DEPENDING ON TEMPERAMENTAL TRAITS
Vladimir Kosonogov, Elena Vorobyeva, Alisa Titova
The current study explored the link between temperamental traits and the recognition of anger. Participants (N = 69) watched morph faces which consisted of 100 frames (pictures) depicting a gradual transition from anger to neutral face and vice versa. Structure of Temperament Questionnaire was used to measure temperamental traits of participants.

DISPLAY OF ANGER IN LECTURER-STUDENT INTERACTIONS AT RUSSIAN AND GERMAN UNIVERSITIES
Julia Mendzheritskaya, Miriam Hansen, Vera Labunskaya
This study aimed to find out the association between cultural dimensions, display rules and such aspects of interpersonal interaction as partner’s gender and degree of situation publicity in the lecturer-student communication. We conducted an online-study with lecturers at universities in Russia and Germany.

THE INFLUENCE OF ANTITERRORIST WEBSITES ON VALUE ATTITUDES OF DIFFERENT POPULATION GROUPS
Irina Abakumova, Pavel Ermakov
The analysis of the basic components of Internet-contents influencing sense-value features of consumers has shown that the processual component defines the dynamics of influence of the most sense-saturated components of the perceiving Internet-content and brings their sense-creating potential up to the level of devitrifying senses of the very user.
PS095  
CYBERBULLYING AND YOUTH: FROM THEORY TO INTERVENTIONS  

B08. Development and education - Bullying and aggression

Convenor  Francine Dehue, Open University of the Netherlands, Heerlen - Netherlands  
Presenters  Trijntje Völlink, Open University of the Netherlands, Heerlen - Netherlands  
            Nicole Gunther, Open University of the Netherlands, Heerlen - Netherlands  
            Niels Jacobs, Open University of the Netherlands, Heerlen - Netherlands  
            Katrien Van Cleemput, University of Antwerp, Antwerp - Belgium  
            Heidi Vandebosch, University of Antwerp, Antwerp - Belgium  
            Conor Mc Guckin, College Green, Dublin - Ireland  

This symposium will provide a complete overview on the latest knowledge regarding cyberbullying, and evidence based interventions to prevent and combat (cyberbullying). The presentations of the symposium will be structured on the basis of Intervention Mapping (IM). IM is a protocol consisting of six steps that can be used as an iterative process for theory and evidence-based development of health promotion interventions. The symposium presentations will follow the first 5 steps:

Step 1 Needs assessment: What is the most adequate way to define cyberbullying? What do we know about the prevalence of cyberbullying? What are the (mental-) health consequences of (cyber-) bullying?

Step 2 Defining change objectives: What are the most important behaviors and determinants related to (cyber-)bullying? To what extent are cyberbullying and bullying distinct or related? And which coping strategies are effective in preventing and combatting (cyber-) bullying? What are the most important change objectives to prevent and combat cyberbullying?

Step 3 Theory-based intervention methods and practical applications: Which theories and methods can be used to prevent and combat cyberbullying? What practical strategies can be used in interventions and which change objectives do they try to influence?

Step 4 Intervention programs: Which interventions are developed using Intervention Mapping? What is known about their effects? What is needed for further improvement of these interventions?

Step 5 Developing the program while making sure that it matches the previous steps and preferences of the target group.

Step 6 Evaluation: How adequate is the definition of cyberbullying?, do the interventions indeed contribute to decrease (cyber-)bullying, recommendations for improvement of the interventions.

One of the unique advantages of this symposium is that it is based on the book ‘Cyberbullying and Youth: from theory to interventions’ that will be published by Psychology Press in July 2015 as part of the Current Issues in Social Psychology series.

NEEDS ASSESSMENT

Nicole Gunther

Early studies on cyberbullying developed a definition in a top-down approach starting from the definition of traditional bullying. The adequacy of these definitions will be discussed. Moreover, a systematic narrative review of the quantitative research to date on the negative outcomes of cyberbullying compared to traditional bullying is provided.
DEFINING CHANGE OBJECTIVES; BEHAVIORAL AND (INDIVIDUAL AND SOCIAL) DETERMINANTS OF BULLYING AND CYBERBULLYING
Trijntje Völlink
This presentation will explore current findings to determine key similarities and differences between behavior and determinants of traditional and cyber bullying. Practical implications will be discussed in regard to the question whether interventions should specifically tackle cyberbullying, or address this as just one component of traditional bullying behavior among peers.

THEORY-BASED INTERVENTION METHODS AND PRACTICAL
Niels Jacobs
The theoretical reasons as to why online interventions are considered useful tools to combat cyberbullying, several theory-based methods and strategies that can be used, different elements that should be taken into account for a successful intervention and the importance of including program participants into the development will be discussed.

INTERVENTION PROGRAMS: CURRENT STATE OF THE ART
Katrien van Cleemput, Heidi VandeBosch
In this presentation four interventions will be introduced. Two newly developed ICT-based interventions have a main focus on combatting cyberbullying (i.e. Friendly Attac and Online Pestkoppenstoppen.nl) whereas two other existing ICT based interventions have a main focus on traditional bullying (i.e. FearNot and Let’s not fall into the trap). The pros and cons of both approaches will be discussed.

EVALUATION: COMPARING INTERVENTION PROGRAMS AND CONCLUSIONS
Conor Mc Guckin
This presentation integrates ‘know how’ of Part I and the practical applications of Part II. The main questions that will be discussed are: Is the definition of cyberbullying adequate in selecting the children who actually need help? To what extent do the ICT interventions of presentation 4 indeed differ in the use of methods, practical applications and content? How effective are these interventions to combat (cyber-) bullying? Recommendations to improve future intervention.

INTERNET, TECHNOLOGY AND SOCIAL CHANGE: A SOCIAL PSYCHOLOGICAL PERSPECTIVE

C09. Culture and society - Media and communication

Convenor Sharon Coen, University of Salford, Manchester - United Kingdom
Presenters Olawale Oni, University of Salford, Manchester - United Kingdom
Caroline Jones, University of Salford, Manchester - United Kingdom
Augusta Isabella Alberici, Catholic University of Milan, Milan - Italy
Patrizia Milesi, Catholic University of Milan, Milan - Italy
Anna Kende, Eötvös Loránd University, Budapest - Hungary
Discussant Abigail Locke, University of Huddersfield, Huddersfield - United Kingdom

Echoing the long standing debate in political communication which sees (news) media as a force for democratisation (the “virtuous cycl” perspective, championed by Pippa Norris, e.g. Norris, 2000), or as the cause of disengagement and apathy (the ‘spiral of cynicism’ perspective, e.g. Capella and Jamieson 1997), the diffusion of the internet and the progressive affirmation of social media (SM) as a platform of communication have opened a debate concerning the potential of these new forms of communication to foster civic – and political – engagement. On the one hand, internet skeptics (e.g. Morozov, 2011) see the internet as the main avenue for “slaktivism” (i.e. low-effort actions which substitute a more substantial engagement), on the other, enthusiasts (e.g. Shirky, 2008) view the online world as a unique platform not only for deliberation, but also for organisation and coordination of collective action. The proposed symposium, bringing together research conducted in four Nations (Nigeria, UK, Italy and Hungary), will present a social psychological perspective on the role played by online platforms in fostering deliberations concerning political and social issues in the community by identifying the underlying processes involved in adoption, use and participation in online debates as well as the link between online participation and offline activism.
It is hoped that this debate will provide insight on the important contribution that social psychological research and evidence can give to understanding the role played by new technologies in public deliberation, the development of an informed citizenry and civic engagement.

WHAT ROLE DO WE SEE YOU PLAY FROM HERE? OF DIGITAL TECHNOLOGY ADOPTION FOR PARTICIPATORY PROGRAMMING IN RADIO BROADCASTING
Wale Oni

This paper explores the impact of technology adoption in journalism by reporting the results of a series of studies looking at journalist’s own – and audience’s beliefs about - role conceptions in the context of participatory radio programming in Nigeria.

ECHO CHAMBER? AN ANALYSIS OF THE PUBLIC’S REACTION TO LOCAL NEWS REPORTS OF THE SALFORD RIOTS IN LOCAL NEWSPAPERS
Sharon Coen, Caroline Jones

We report a media framing analysis exploring the relationship between the coverage of the Salford riots in local newspapers and the public reaction (in terms of comments posted online) to such reports.
COLLECTIVE ACTION AND THE SOCIAL AFFIRMATION FUNCTION OF SOCIAL MEDIA
Anna Kende, Adrienn Ujhelyi, Nóra Lantos, Martijn van Zomeren, Eötvös Loránd
Starting from the SIMCA model of collective action, we report three studies exploring whether social (i.e. social affirmation, network building, interactive, and creative) uses of social media motivate collective action intentions and activist endurance.

“THE RIGHT THING TO DO”: DISCUSSING ONLINE AND THE MORAL PATHWAY TO COLLECTIVE MOBILIZATION
Augusta Isabella Alberici, Patrizia Milesi
Activists of two web-based political groups participated in two studies. We investigated whether activists’ perceptions of some features of online deliberation moderated the link between moral obligation beliefs and politicized identity.

EMERGING ADULTHOOD TODAY

C02. Culture and society - Family systems and processes

Convenor  Lucia Leonilde Carli, University of Milan-Bicocca, Milan - Italy
Presenters  Elena Anzelmo, University of Milan-Bicocca, Milan - Italy
Franca Tani, University of Florence, Florence - Italy
Marzana Daniela, Catholic University of Milan, Milan - Italy
Margherita Lanz, Catholic University of Milan, Milan - Italy
Emanuela Rabaglietti, University of Turin, Turin - Italy
Discussant  Heike Maria Buhl, University of Paderborn, Padeborn - Germany

Social changes during the last decades have contributed to prolong the path toward adulthood. The juvenile phase is now extended in time and is undefined from a social, professional and affective point of view, rather than constituting a temporary condition. Within psychological and psycho-social literature this situation is indicated by the introduction of the distinction between emerging adulthood and young adulthood.

The Symposium proposes an analysis and a discussion of the factors that may play a role in the path toward adulthood and that can influence emerging adults’ wellness, as well as their future as potential adults and parents-to-be.

In particular, it will be discussed the role of attachment to peers (partners and friends) in connection to Italian emerging adults’ current attachment to parents and life satisfaction; the emergence of new attachment networks among Italian students and working emerging adults in connection to romantic attachment and recalled parental bonding; the links between the juvenile Neet condition (Not in Employment, Education or Training) in Italy and family factors of a relational and socio-demographical nature; the individual and family predictors of Italian emerging adults’ financial and subjective well-being; the relationship between emotion-related textual content posted by Italian young adults on their Facebook profiles and their emotional well-being.

PARENT AND PEER ATTACHMENT: WHICH INFLUENCE ON EMERGING ADULTS’ LIFE SATISFACTION?
Tani Franca, Guarneri Silvia, Smorti Martina

Attachment relationships with parent and peer are a major indicator of life satisfaction and individual well-being. Despite this, there has been insufficient empirical work focused on understanding the interrelationships and links between attachment to specific social partners (mothers, fathers, friends and romantic partners) and life satisfaction during emerging adulthood. The main focus of the present study was to examine the influence of parental attachment on emerging adults’ life satisfaction. In addition to considering direct associations between these variables, we investigated indirect pathways through peer attachment in emerging adulthood. The sample comprised 385 emerging-adult adolescents (36.1% females), aged from 18 to 25 years. The Inventory of Parent and Peer Attachment was administered to assess parent and peer attachment. The Experiences in Close Relationships was employed to assess romantic attachment. Finally, the Satisfaction with Life Scale was employed to assess life satisfaction. Structural equation modeling techniques were used to identify the direct and indirect effects of parental attachment on life satisfaction. Results indicated that both parental attachment and peer attachment were positively related to life satisfaction, with romantic attachment being the stronger unique predictor. Further, the findings suggest that only romantic attachment mediates the association between attachment to mother and life satisfaction. Romantic partners
achieve a privileged position in an emerging adults’ affective world. Nevertheless, parents continue to have a crucial influence on their children’s lives. Results appear to be consistent with the prototype hypothesis, which claimed that early attachment experiences lay a foundation for future intimate relationships.

ATTACHMENT NETWORK DURING EMERGING ADULTHOOD

Elena Anzelmo, Judith Feeney, Lucia Leonilde Carli

Several studies have shown the growing importance of partners and friends as targets of attachment functions within adolescents’ and young adults’ attachment networks (Hazan, Zeifman 1994; Fraley, Davis 1997; Trinke, Bartholomew 1997; Feeney 2004). These studies linked a transfer of attachment functions’ from parents to partners, with relationship length and romantic attachment security. However, studies connecting the transfer of attachment functions and recalled parental bonding are lacking (Friedlmeyer, Granqvist 2006).

The aim of the present study is to investigate emerging adults’ attachment networks and their links with both socio-demographical variables, such as gender and worker/student status, and relational variables, such as romantic relationship length, romantic attachment and recalled parental bonding. The study is part of a broad project called ‘Parenthood today’ financed by IReR (Regional Research Institute of Lombardy). The aim of the project is to investigate, during different phases and conditions of the life-cycle, critical factors for parenting choice and parental investment.

Participants were 257 Italian emerging adults (63.8% female) aged between 19 and 24 who were student or workers. All participants were currently in romantic relationships. Self-reports were used: 1) a self-report adaptation of WHO-TO interview (Hazan, Zeifam 1994) for attachment networks; 2) the Parental Bonding Instrument (Parker et al. 1979) for recalled parental bonding (Care and Overprotection); 3) the Experience in Close Relationship Revised (Fraley et al. 2000) for romantic attachment (Anxiety and Avoidance).

Results showed 5 attachment network configurations that varied significantly according to gender, student/worker status and romantic relationship length. Some of these configurations were also connected to Avoidance and to Maternal Care.

WHO ARE ITALIAN “NEETS”? YOUNG ITALIAN NEETS AND THEIR FAMILY BACKGROUND

Daniela Marzana, Sara Alfieri, Elena Marta, Emiliano Sironi, Alessandro Rosina

The present work aims to investigate the relationship between several family variables (parents’ educational level, intrusiveness, support, and autonomy) and young Italians’ status as NEETs (Not in Employment, Education, or Training). A representative sample of 9,087 young Italians filled out an online questionnaire. The results reveal that perceived degree of autonomy has a specific negative impact for males Neets while intrusiveness presents a positive impact mainly for females Neets.

ITALIAN EMERGING ADULTS’ FINANCIAL AND SUBJECTIVE WELL-BEING: INDIVIDUAL AND FAMILY PREDICTORS

Margherita Lanz, Semira Tagliabue, A. Sorgente

The prolonged transition to adulthood, characterizing the Mediterranean area and in particular Italy (Tagliabue, Beyers, Lanz, 2014), challenges research in investigating the factors enhancing emerging adults’ well-being. In particular the financial crisis of 2008 determined a difficult financial situation, especially for emerging adults. Thus, research on emerging adults’ well-being should also consider the financial dimension (Shim et al., 2009). The study aims to illustrate the different factors explaining financial and subjective well-being in emerging adulthood. Individual factors (work condition, living arrangement, financial independence, age, personal needs and expenses), family
Symposia 001 - 156

Factors (family structure, parental [emotional] and financial support, perceived financial status) and individual and financial well-being were collected from 285 Italian emerging adults (20-30 years old). Preliminary findings underline that different predictors affect subjective well-being according to emerging adults' work condition. Moreover, family variables (emotional support and perceived financial status) explain different percentages of financial well-being's variance: students (54%), student-workers (27.3%) and workers (16.7%). Multigroup analyses related to emerging adults working condition will be performed. Findings will be discussed taking into account the European context.

Textual Indicators of Emotional Well-Being: A Study on Facebook Among Young-Adults

Davide Marengo, Michele Settanni, Emanuela Rabaglietti

The relationship between online behaviors on social network sites (SNS) and offline behaviors, attitudes and personality is well documented. Concerning internalizing symptoms, findings suggest that the analysis of user-generated content on Facebook profiles can provide relevant information for the identification of users at risk for depression and anxiety. In most studies, rating of user content is generally performed by manually browsing SNS user profiles. Automated text analysis could represent a more cost-effective, time-efficient analytic approach. In a sample of 199 young-adults (Mean age: 28.4 years; 66% females), the main aim of the present study was to investigate the relationship between emotion-related textual content posted by participants on their Facebook profiles and self-report symptoms of depression, anxiety and stress. As a secondary aim, age differences were investigated. Automated text analysis was performed with the LIWC software. The DASS-21 scale was used to collect information about internalizing symptoms. Correlation analyses revealed the Negative emotions and Sadness LIWC categories to be positively correlated with self-report depression, anxiety and stress, while Anger correlated only with anxiety. Overall, the frequency of emotion-related words was found to be higher for participants aged ≤ 25 years than for older participants; correlations between the LIWC emotional categories and the DASS-21 scales were also generally stronger for younger participants. Finally, results are compatible with findings on more traditional text sources and support the use of automated text analysis for the extraction of meaningful indicators of psychological distress from textual content posted on SNS, in particular for young users.

The study of Tani, Guarnieri and Smorti analyses the mediation role of attachment to peers (partners and friends) in connection to emerging adults’ current attachment to parents and life satisfaction. This study suggests the importance of partners in addition to parents for emerging adults’ well-being.

The study of Anzelmo, Feeney e Carli explores the emergence of new attachment networks within distinct groups of students and emerging working adults by investigating their preferred target figures for attachment functions. This study also connects emerging adults’ attachment networks to romantic attachment and recalled parental bonding.

The contribution of Marzana and colleagues examines the Neet condition (Not in Employment, Education or Training), namely a juvenile condition of individuals not committed to learning or working activities during the last 6 months. This study links this status to family factors of a relational and socio-demographical nature.

The study of Lanz, Tagliabue and Sorgente examines the individual factors (work condition, living arrangement, financial independence, age, personal needs and expenses) and the family factors (family structure, parental emotional and financial support, perceived financial status) explaining financial and subjective well-being in Italian emerging adulthood.
Lastly, the study of Settanni, Marengo e Rabaglietti examines the relationship between emotion-related textual content posted by Italian young adults on their Facebook profiles and their self-report symptoms of depression, anxiety and stress.
NEW DIRECTIONS IN RESEARCH ON THE EMOTION REGULATORY FUNCTIONS OF PSYCHOLOGICAL DISTANCE

E11. Health and clinical intervention - Lifestyles and healthy self-regulation

Convenor  Ozlem Ayduk, University of California, Berkeley - United States
Presenters  Ozlem Ayduk, University of California, Berkeley - United States
           Ethan Kross, University of Michigan, Ann Arbor - United States
           Louis A. Penner, Wayne State University, Detroit - United States
           Rachel E. White, University of Pennsylvania, Philadelphia - United States

The concept of psychological distance -- the removal of events from direct experience of “me” in the “here-and-now” has been central to social psychological theories of self-regulation for the last 50 years. Growing out of this work, recent research has focused how psychological distance from the self specifically, impacts emotion regulation and well-being. Findings have shown that focusing on negative emotions from a third person, self-distanced as opposed to a first person, self-immersed perspective reduces emotional reactivity and enhances well-being by facilitating big picture appraisals on distressing events. In this symposium, we will present novel extensions of this work, which begin to shed light on the regulatory functions of different psychological distancing strategies using multiple designs (experimental, individual differences, longitudinal), populations (college students, community participants, adolescents) and levels of analyses (behavioral, developmental, neural).

Kross & Ayduk will review findings demonstrating that using non first person pronouns and one’s own name (rather than “I”) during introspection enhances psychological distancing from the self. In turn, these different types of “self-talk” consequentially impact self-regulation across multiple contexts (i.e., making good first impressions and public speaking) leading people to experience less distress, ruminate less, and perform better. He will also present neural data underscoring the utility of this strategy for automatic and effortless down-regulation of negative affect.

White & Duckworth will address the question of whether adolescents spontaneously engage in self-distancing (i.e., taking an observer perspective during visualization) and whether doing so is linked to adaptive outcomes. Their findings show that spontaneous self-distancing while reflecting on anger-related experiences predict better emotion regulation, and that this relationship strengthens with age. These findings highlight the role that self-distancing plays in fostering adaptive self-reflection in adolescence, and begin to elucidate the role that development plays in enhancing the benefits of engaging in this process.

Penner, Gueverra & Albrecht will present data on parents of pediatric cancer patients -- a group known to be vulnerable to psychosocial problem associated with their child’s disease. Findings show that parents who were both high in trait anxiety and spontaneously self-distanced as they analyzed their feelings surrounding a past medical procedure their child went through reported less distress in response to subsequent medical procedures and greater well-being longitudinally. These findings underscore the utility of harnessing self-distancing as a regulatory mechanism in at-risk populations.

Ayduk & Bruehlman-Senecal will present data on temporal distancing demonstrating that adopting a distant-future perspective (e.g., how will I feel about this 10 years down the line) on stressors relative to a near-future (e.g., how will I feel about this 1 week from now) perspective reduces emotional distress regardless of event severity. Moreover, this effect is mediated by impermanence focus—that is, the extent to which participants focused on the transitory aspects of their stressors. Temporal distancing thus, seems to be a relatively easy to implement distancing strategy that buffers against both minor and major stressors.
SELF-TALK AS A REGULATORY MECHANISM: HOW YOU DO IT MATTERS
Ethan Kross, Ozlem Ayduk
We will review findings from a program of research demonstrating how third-person (vs. first person) self-talk fosters effective self-regulation at the experiential, behavioral, and neural levels by fostering challenge (vs. threat) appraisals.

SPONTANEOUS SELF-DISTANCING PREDICTS ADAPTIVE SELF-REFLECTION ACROSS ADOLESCENCE
Rachel E. White, Angela L. Duckworth
In two studies, adolescents reflected upon anger-inducing or worrying personal experiences. Spontaneously self-distanced (v. self-immersed) reflection on these events predicted more adaptive insight and, in turn, less emotional reactivity.

SPONTANEOUS DISTANCING AMONG PARENTS OF PEDIATRIC CANCER PATIENTS
Louis A. Penner, Darwin Gueverra, Terrance Albrecht
Among parents of pediatric cancer patients, high trait anxious parents’ spontaneous use of self-distancing (i.e., third-person perspective) while thinking about a past medical procedure for their child prospectively predicted better parental functioning.

THIS TOO SHALL PASS: TEMPORAL DISTANCE AND THE REGULATION OF EMOTIONAL DISTRESS
Ozlem Ayduk, Emma Bruehlman-Senecal
Findings indicate that focusing on how one would feel about a stressor in the distant future (i.e., temporally distanced perspective) fosters distress regulation and well-being by leading people to focus on the impermanent aspects of their emotions.
Research in psychotherapy imposes, among other things, a challenge with objectivity. In addition to that, the research data are limited partially due to the scarcity of standardized and reliable tools. In particular, until now, researchers have been lacking of an effective and shared monitoring tool able to assess psychopathological disorders and their development in a given time-frame, for a given case and considering the relational and non-verbal aspects of the therapeutic process.

Telpress Doctor Notes is a method that combines clinical interpretative models with the monitoring of the interactions and transactions via a technology originally intended for audiovisual classification and analysis. Introduced by Telpress International BV this technology, which is based on a software architecture, has been newly applied in psychological assessment and in individual, couple and family therapy.

With implications also for training, this technology helps clinicians in their supervision activities as well as in clinical analysis. It provides support in analyzing, annotating, labeling and indexing local or remote audiovisuals - also in real-time - and integrates a sharing mechanism, making results available to the scientific community, revealing as a simple, user friendly and standardized tool. The system also allows to extract annotated non verbal content as well as to produce textual documents with embedded videoclips or snapshots where necessary.

The annotation consists in the integral or partial transcription of the verbal and non-verbal communication and it provides an effective method to store and index large amounts of structured or unstructured clinical data along with the audiovisual information and its metadata. With its integrated searching tools, thousands of hours of audiovisual documents become available in an indexed form, so that local and remote operators can extract only relevant sections according to their submitted search criteria.

This methodology is useful in clinical assessment, for example in the analysis of Adult Attachment Interview (AAI) and in the study of implicit mentalization, based on non-verbal and procedural elements. Psychotherapists can compare data useful for research and clinical ends and, when permitted, extract visual clues of data provided by other clinicians; keeping track of the evolution of their own research and treatment becomes a possible and simple task. Educators can track and supervise trainees and trainees can analyze sessions with precision and without the need to learn sophisticated software tools nor the necessity to buy dedicated hardware appliances.

The user interface in itself represents an innovation and permits to run in all available web browsers making its use potentially ubiquitous, its learning process very fast and cost effective. This contributes
to make of Telpress Doctor Notes a strong allied for the research community in clinical assessment and in psychotherapy, allowing operators to set common goals with mutually verifiable progresses.

In brief, Telpress Doctor Notes can help to reach these fundamental goals:

- live tagging of real-time sessions and events
- annotate on the basis of verbal and non-verbal communication
- indexing and quick data retrieval of audio visual elements
- remote and real-time supervision of psychotherapeutic sessions
- (selective) sharing of the information with the scientific community for research, training and therapeutic ends.

FAMILY PSYCHOTHERAPY AND NEW TECHNOLOGIES

Antonio Acerra

Clinical research in family psychotherapy imposes, as a necessary assumption, to abandon the necessity of objectivity, the inclusion of the observant and the observed and the rigidity of the method used. We are proposing a method that combines the systemic-relational paradigm with the monitoring of the interactions and transactions through a new technology.

IMPLICIT MENTALIZATION ASSESSED BY MENTALIZATION ASSESSMENT IN PSYCHOTHERAPY (MAP)

Franco Baldoni

Examples of implicit mentalization in a psychotherapeutic session will be displayed following Mentalization Assessment in Psychotherapy (MAP) criteria (Baldoni 2014) and using Telpress Doctor Notes method for the analysis of non-verbal behavior.

NON-VERBAL BEHAVIOR IN ADULT ATTACHMENT INTERVIEW (AAI). AN ANALYSIS USING TELPRESS DOCTOR NOTES METHODOLOGY

Mattia Minghetti, Giulia Landi

An example of a videotaped Adult Attachment Interview (AAI) will be displayed codified following Dynamic-Maturational Model of attachment and adaptation criteria end using Telpress Doctor Notes methodology to study non-verbal behaviour.

TELPRESS DOCTOR NOTES: A BRIEF INTRODUCTION TO THE NEW TECHNOLOGY

Vincenzo D’Innella Capano

Telpress Doctor Notes is a new technology implementing a method that combines clinical interpretative models with monitoring of the interactions and transactions via a web platform originally intended for audiovisual classification and analysis.
Longitudinal investigations into educationally relevant traits have provided insights into their development and the nature of their interrelationships. The proposed symposium presents a collection of investigations into individual differences in educationally relevant traits and their aetiologies using longitudinal methodologies.

The first talk (Rodic) is a large-scale cross-cultural study of cognitive development. The talk explores the longitudinal relationship between mathematics anxiety, mathematics achievement and mathematically related cognitive traits in 6-9-year-old children from the United Kingdom and Russia. The second talk (Malanchini) combines longitudinal and genetically sensitive methodologies to investigate individual differences in mathematics motivation and its association with school achievement in a large sample of twins. The talk discusses the stability of the aetiology of mathematics motivation and achievement as well as the origins of their longitudinal (age 9 – 16) relationships. The third talk (White) presents findings from a longitudinal, cross-cultural investigation of 11-12 year-old children in Russia and the United Kingdom. The study explores the developmental trajectories of school achievement, cognitive abilities, anxiety, self-efficacy and enjoyment in the context of mathematics and geography classrooms. The fourth study (Tosto) applies multivariate genetic analyses to investigate the aetiology and development of oral language and components of reading fluency and reading comprehension between childhood and adolescence (ages 7 – 16).

**MATHS ANXIETY, EARLY ARITHMETIC AND MATHS RELATED COGNITIVE SKILLS: A LONGITUDINAL & CROSS-CULTURAL INVESTIGATION**

*Maja Rodic, Tatiana Tikhomireva, Sergey Malykh, Olga Bogdanova, Xinlin Zhou, Yulia Kovas*

The longitudinal relationship between maths anxiety, maths achievement and mathematically related cognitive traits was investigated in Russian and UK early primary school children. The emerged cross-cultural similarities and differences are discussed.

**MATHEMATICS MOTIVATION: STABILITY AND CHANGE IN ITS AETIOLOGY AND ITS LONGITUDINAL ASSOCIATION WITH MATHEMATICS ACHIEVEMENT**

*Margherita Malanchini, Zhe Wang, Robert Plomin, Yulia Kovas*
We explored the origins of mathematics motivation and its development over time (age 9 to 16) in a large sample of twins. The longitudinal relationship between mathematics motivation and mathematical ability and achievement was also investigated.

A LONGITUDINAL CROSS-CULTURAL INVESTIGATION INTO POTENTIAL RELATIONSHIPS BETWEEN COGNITIVE AND NON-COGNITIVE FACTORS WITHIN THE MATHS AND GEOGRAPHY CLASSROOM
Elaine White, Efrosini Setakis, Tatiana Kolienko, Yulia Kovas
This longitudinal study followed UK and Russian students aged 11-12 years on multiple occasions across one academic year focusing on their maths and geography classrooms. Developmental trajectories were explored in relation to non-cognitive factors and cognitive abilities.

ORAL LANGUAGE, READING FLUENCY, READING COMPREHENSION: THE AETIOLOGICAL RELATIONSHIP BETWEEN 7, 12 & 16 YEARS. A UK TWIN-STUDY
Maria Grazia Tosto, Philip Dale, Robert Plomin, Emma Hayiou-Thomas
Genetic analyses on reading fluency, comprehension & language measured at 7, 12 & 16 in UK twins revealed genetic factors as responsible for stability & covariation within & across domains. Fluency & comprehension showed a partial different aetiology.
PS101
BEING TOGETHER APART: USING TECHNOLOGY TO SUPPORT PEOPLE LIVING WITH CHRONIC ILLNESS

E11. Health and clinical intervention - Lifestyles and healthy self-regulation

Convenor Karen Rodham, Staffordshire University, Staffordshire - United Kingdom
Presenters Jeff Gavin, University of Bath, Bath - United Kingdom
Neil Coulson, University of Nottingham, Nottingham - United Kingdom
Karen Rodham, Staffordshire University, Staffordshire - United Kingdom
Discussant Daryl O’Connor, University of Leeds, Leeds - United Kingdom

Health systems are struggling “to cope with the demands of acute care, let alone the needs of those with long term health conditions,” (Barlow, Wright, Sheasby, et al., 2002), it is therefore essential that those living with chronic conditions are able to self-manage. Successful self-management necessitates the development of a range of skills including knowledge of the condition and its treatment, maintenance of adequate psychological functioning and the ability to implement lifestyle changes required when living with a chronic condition (e.g. Clark, Becker, Janz et al., 1991; Redman, 2011). Technology has the potential to play an important role in facilitating the ability of people with chronic conditions to self-manage. For example, a number of researchers have documented the utility of online support groups. However, the provision and moderation of such sites can be an onerous task and can bring with it the fear of litigation. There are a number of ways online support can be offered – via support groups, mobile phone apps, wiki technology, Facebook and other social media platforms. However, with increasingly sophisticated technology available to us, are we at risk of acting like the Emperor and his new clothes? Are our heads turned by the sci-fi technology that is increasingly moving from the realm of the imagined to that of reality? In order to explore these issues, this symposium addresses 3 key issues related to providing remote support for people living with chronic conditions:

· Building and nurturing a supportive online environment
· The role of moderators
· The experiences of forum members

BUILDING AND NURTURING A SUPPORTIVE ONLINE ENVIRONMENT
Jeff Gavin, Karen Rodham, Neil Coulson, Leon Watts
This talk will present the findings from an NIHR funded research study which set up an online forum and observed how support grew and developed. Implications for the provision of online support are explored.

THE ROLE OF GROUP MODERATORS WITHIN HEALTH-RELATED ONLINE SUPPORT COMMUNITIES
Neil Coulson, Rachel Shaw, Richard Smedley
Two studies will be presented exploring a) views of 33 moderators and b) a thematic analysis of 790 moderator messages with regards the processes, challenges and benefits of their role. Implications for successful community development are explored.
MEMBERS’ EXPERIENCES OF HEALTH-RELATED ONLINE SUPPORT COMMUNITIES
Karen Rodham, Jeff Gavin, Neil Coulson, Leon Watts, Toni Karic, Hannah Heath
This talk will present the findings from a programme of studies exploring members’ experiences of health-related online support communities. Lessons for health professionals, forum developers and patients are explored.
PS102
ART THERAPY FOR PSYCHOLOGICAL AND COMPLEXITY TRAINING

E22. Health and clinical intervention - Other

Convenor  Tania Simona Re, Careggi Hospital, Florence; University of Florence, Florence; University of Genoa, Genoa - Italy
Presenters  Paolo Barcucci, Dean of the Health Section – Addiction Sector, Torino - Italy
Tania Simona Re, Careggi Hospital, Florence; University of Florence, Florence; University of Genoa, Genoa - Italy
Katja Lemberg, Director of KASVAVA Project - Finland
Eija Tarkiainen, Responsible of Minuksi Project - Finland
Silvana Cagiada, Cultural and Research Association “Care of Human Beings”, Crema - Italy
Luisa Merati, Euromediterranean Network for Humanities in Medicine - Italy
Flavia Barbagelata, Member of the Italian Association of Psychosomatic Medicine - Italy
Bruna Dighera, Il Gabbiano Association - Italy
Discussant  Tania Simona Re, Careggi Hospital, Florence; University of Florence, Florence; University of Genoa, Genoa - Italy

The training of psychologists poses increasingly complex challenges, in parallel to the increasing articulation of our societies and wider opportunities for intervention that will make it possible and necessary for this professional.

For several years we have carried out experiments and projects, training area, then not only fundamentally therapeutic or preventive, in which the use of expressive and performative methods such as art therapy, are used to prepare professionals from various areas, including which psychologists, the complexity of their role.

We could say that there is a possibility to include in the curricula a subject that could almost be described as "the complexity in and of itself," and that training in this specific field are particularly useful form of expression just as the fine arts, while representing a distinct area-technical language, convey the right to citizenship in that capacity for suspension of disbelief that in an era increasingly exclusive measurability "objective", and in which the recovery of the areas rather uncertain and unspeakable, without of course for this to abdicate irrational, it is absolutely necessary.

The symposium will also describe some experiences run triple in the formation of groups in which a psychologist expert in cultural anthropology, one expert on addictions therapist and a psychiatrist art have addressed the issue of altered states of consciousness through shamanic techniques and exorcism without nothing to give up the rationality and even the evocative power of these rituals.

THE UNESCO CHAIR IN GENOA: A POSSIBILITY FOR AN INTERDISCIPLINARY APPROACH
Tania Simona Re, Paolo Barcucci

The UNESCO chair project stems from a cultural necessity to fill and a wealth of knowledge to preserve. Health, environment and treatment strategies are considered to be strictly connected in contemporary medicine. This new, integrated approach contradicts and overcomes the traditional separation between humanities, scientific medicine and treatment. Health and approach to treatment
strategies are not uniform around the worlds; the universal baseline is quality assurance of investigation in science.

AUTOHYPNOSIS
Silvana Cagiada
Practice of self-hypnosis, so unscientific, are still used by primitive peoples or by some Eastern religious with the same procedures used by the ancient seers Egyptians, Aztecs, Greeks and Romans, to facilitate the self-induction of trance, they used techniques are not so different those who today have a clinical use in auto and hetero induced hypnosis.
The best use of the principles of functioning of our brain, even in the light of new scientific knowledge of psychobiology, we can have a vision of a broad spectrum of ways of which the mind uses to communicate with the body in somatic, visceral, humoral also through 'integration between science and practice "natural", since all that is archaic and primitive is always within us.

THE ARTISTIC EXPRESSION AS A MEDIUM OF COMMUNICATION MULTIMODAL
Luisa Merati, Flavia Barbagelata
We propose a project of holistic therapy for inner growth, structured as a formal organization that uses musical modes of communication trans modal technique in which visual images and sound integrated, but also olfactory and gestural come together to offer a similar experience the artistic expression of self and hetero direct, according to the archaic language of the dream, to establish a direct bridge of communication with the deep unconscious and enable scenarios such as to growth and deep natural harmonic.

KASVAVA (GROWING)
Katja Lemberg, Eija Tarkiainen
Kasvava (growing) is a Finnish national project that lasts for almost ten years, sponsored by the Association of Psychiatrists of South East Finland and funded by the Finnish Agency of the monopolies. The project was built to meet the demand of the people to be able to find reports and tools to stay in a single place with all their inner dimensions and every aspect of daily life. The working tools were built on experiential knowledge and all operators have initially made their way inside the structure.

THE PATH OF THE “THREE HELLS” AS A PROCESS OF SOCIAL TRANSFORMATION
Bruna Dighera
In the framework of the activities carried out by thirty years in the community of “Il Gabbiano”, the meeting with the association CRAMS (Research Centre Art Music Entertainment) has produced a fertile contamination that has allowed us to realize a large share in Lecco area of social transformation, taking advantage of an ongoing collaboration with the students of vocational schools and art, involves migrants, individuals at risk, groups affected by poverty and marginalization.
The social action conduct ended with an art installation, coprogettata by students and by the population is under construction, emblematic title "The three Hells".
PS103
INTEGRATIVE MEDICINE, MINDFULNESS, HYPNOSIS AND EMDR:
NEW FRONTIERS FOR TREATMENTS

F12. EXPO 2015 Hot Topics - Mindfulness

Convenor  Tania Simona Re, Careggi Hospital, Florence; University of Florence, Florence; University of Genoa, Genoa - Italy

Presenters  Davide Lazzari, SIPNEI President (Italian Society of Psychoneuroendocrinology) - Italy
Laura Gianotti, Hospital Santa Croce, Cuneo - Italy
Piero Stanley Pirro, Hospital Santa Croce, Cuneo - Italy
Isabella Bonapace, Psy Mindfulness Trainer - Italy
Tania Simona Re, Careggi Hospital, Florence; University of Florence, Florence; University of Genoa, Genoa - Italy
Luisa Merati, Italian Society of Psychosomatic Medicine SIMP, Euromediterranean Network for Humanities in Medicine - Italy
Jorge Emanuel Martins, University of Lisbon, Lisbon - Portugal
Maura Franca Garombo, S.I.S.P.Se o.n.l.u.s Italian Society of Sexual Psychopathology - Italy
A. Contarino, S.I.S.P.Se o.n.l.u.s Italian Society of Sexual Psychopathology - Italy
C. Rosso, S.I.S.P.Se o.n.l.u.s Italian Society of Sexual Psychopathology - Italy

Discussant  Mario Simones, University of Lisbon, Lisbon - Portugal

Integrative Medicine is gaining attention worldwide both in terms of a complementary and an alternative approach to the conventional therapies. Integrative Medicine has expanded in different categories: alternative medical systems (e.g., homeopathy, traditional Chinese medicine); biologically based practices (e.g., herbs, vitamins, food); mind body medicine (e.g., meditation, autogenic therapy, progressive muscle relaxation) and Mindfulness.

Indeed the last 5-10 years have witnessed huge steps and the vast mobilisation of multidisciplinary competences “toward a Science of Consciousness”, as clearly illustrated in the recent international conference on that topic held in Stockholm under the patronage of the Center for Consciousness Studies of the University of Arizona and of the Perffjell Foundation. At the same time that Science, and especially the Neuroscience and the Physics of consciousness progresses, tools and new understanding have been developed that will allow for the transfer of much of that basic Science into clinical practice. This transfer doesn’t only concern the clinical practice exclusively with mental disease but also the regular clinical practice where a patient, using his, or her mind, can influence the progression of disease, becoming what one could rightly call a therapeutic partner.

The need to establish connections between Medicine, especially in the therapeutic aspect (healing), and all the information already obtained from the mind-matter phenomenology has led to much experimentation and the arising in this border area.

The Mind Body medicine uses the power of thoughts and emotions to a positive impact on maintaining health and in the healing process. The mind-body approaches, particularly those that use the relaxation response and beliefs of the patient, have been found effective in different mental and physical disorders. This is an area where new developments are happening everyday and where there is growing evidence that new techniques like mindfulness, EMDR, hypnosis can influence and alter many physiological processes including the immune system. It stands to reason that further experimentation in this area is therefore necessary.
“MOLECULES OF EMOTION”: THE EPISTEMOLOGICAL MODEL OF PNEI

Mirko Labella

We are complex beings. The Psiconeuroendocrinoimmunology is the science that studies and integrated connects various disciplines from medicine to psychology, anthropology, economics, biology to physics. The SIPNEI is the first multidisciplinary company that studies with scientific method approaches of integrated medicine for a health care professional who is familiar with the complexity of the human network.

INSIDE-OUT CONNECTEDNESS: HAPPINESS TRANCE COHERENCE IN A MULTIMODAL NEUROFEEDBACK ENVIRONMENT

Jorge Emanuel Martins

Developed as a neurofeedback BMI to help creating a fully immersion experience of the subject, in order to induce a Subjective Happiness State and Long-Term Well-Being, with Clinical Hypnosis, as a self-taught Altered State of Consciousness. The main outcome of this project is to adapt the healthcare environment to a more mindfulness meditative experience. The multimodal neurofeedback environment is the informational experiential matrix where the subject will create the heart-brain-body neuroplastical coherence to achieve the Inside-Out Connectedness.

MINDFULNESS AND MULTIPLE SCLEROSIS

Isabella Bonapace, Maria Grazia Gaia

The objective of this study is to determine: 1) whether Mindfulness Meditation ameliorates the quality of life in patients affected by Multiple Sclerosis; 2) what evaluation participants have of the Mindfulness program and these will be investigated through semi-structured interviews; and 3) the analysis of what occurred during the program's sessions.

MINDFULNESS BASED STRESS REDUCTION PROGRAM ON CHRONIC LOW BACK PAIN: A PILOT STUDY

Laura Gianotti, Piero Stanley Pirro

The objective of this pilot study is to determine the impact of the Mindfulness Based Stress Reduction (MBSR) program on chronic low-back pain (CLBP) as well as on physical, endocrine (cortisol hormone) and psychological functioning. Participants in this observational study were 28 adults, average age = 47.77, sd = 12.36, median = 47.

EMDR TREATMENT IN SEXUAL OFFENDING

Maura Franca Garombo, A. Contarino, C. Rosso

An Instrumental Case Study This case describes the use of eye movement desensitization and reprocessing (EMDR) to reduce reactivity in a sex offender. Contemporary sex offender treatment theory considers the role of unresolved trauma in the etiology of sexual offending and relapse risk.

A COMPARISON OF EFFECTS OF MINDFULNESS-BASED STRESS REDUCTION BETWEEN PATIENTS WITH ORGANIC DISEASE AND HEALTHY PEOPLE: AN OBSERVATIONAL STUDY

Luisa Merati, Alice Azzoni

Mindfulness-based stress reduction (MBSR) is a stress-reduction program based on meditative practices, it is composed of 8 sessions of two hours and a full-day session. This program has shown consistent efficacy in a variety of populations. The aim of this study is to observe the difference in the outcomes of MBSR in patients with organic disease and healthy people, focusing on psychological and physical well-being, perceived stress and awareness.
Participants (N=13, M(SD) Age= 46.62 (14.28), 70% Women) are divided in two groups: the first group (N=3, M(SD) Age = 49.67 (9.07) , 66% Women ) formed by fibromyalgia, multiple sclerosis and polytrauma patients; the second group (N=10, M(SD) Age = 45.7 (15.8) , 70% Women) formed by healthy people. The groups run the program separately. Data are collected at the start of first, sixth session, at the end of the last session of the treatment and after one month by the end of it; using the Short Form Health Survey (SF-12), the Psychological General Well-Being Index (PGWBI), the Mesure du Stress Psychologique (MSP) and the Mindfulness Attention Awareness Scale (MAAS). Data are analysed with statistical procedures for compare MBSR’s outcomes between the two group of participants and eventually find significant differences.
PS104
RESTORATIVE APPROACH COMMUNITY: PROMOTE WELL-BEING, PREVENT DISRUPTION AND DEVIANCE

C11. Culture and society - Forensic psychology and law

Convenor Patrizia Patrizi, University of Sassari, Sassari - Italy
Presenters Pia Christensen, University of Leeds, Leeds - United Kingdom
Martha Frias-Armenta, University of Sonora, Sonora - Mexico
Patrizia Patrizi, University of Sassari, Sassari - Italy
Giancarlo Tamanza, Catholic University of Milan, Milan - Italy
Discussant Elena Marta, Catholic University of Milan, Milan - Italy

The symposium aims to stimulate a debate on developments of communities marked on a conflict management based on relational, peaceful, responsible and solidarity approach. In particular, we will set up a comparison between different situations where the relationship is the main resource to build social ties, interactions and opportunities for prevention of distress and deviance, generative connections of well-being: between people, between systems, between people and systems.

The conflict/crime management promoted by the restorative model represents a cultural shift: community who call themselves Restorative City, schools that adopt restorative approaches, urban areas that use the community for the effective management and resolution of conflicts (Wright, 2010; Patrizi, 2014). At the citizen is recognized an active role in conflict management and more generally in the government of the community in which he/she lives, making him/her feel part of the system (Wright, 2010). The community can/must therefore be promoting lifestyles and relationships oriented to peace, well-being of the person and the community (Lent & Brown, 2008). The symposium will focus on the presentation of a model of Restorative Justice (Restoratives practices), for the protection and promotion of individuals and communities.

Our model of Restorative Community is immersed therefore in a complex international debate on normative changes, the implementing measures and operational protocols to be adopted in judicial and extrajudicial fields, with the main aim to promote individual and collective welfare, fight recidivism, participate in the dissemination of a sense of social security. Its objectives traced back to the need to revise the penal systems in the light of the scientific evidence and operational considerations and, at the same time, the development of new forms of treatment to reduce the conflict within the social dynamics.

In this regard the symposium will focus on the presentation and comparison of international restorative practices experiences in judicial and extrajudicial fields.

A RESTORATIVE COMMUNITY MODEL APPROACH: PROCESSING THE PROCESS
Patrizia Patrizi, Gian Luigi Lepri, Anna Bussu, Ernesto Lodi

The paper will present the development of a theoretical research on governance, on indicators and restorative justice that substantiate the proposed model of Restorative Community, the ReCo model. Will be presented the structure of the action-research project that provides focus groups in order to involve the representatives of institutional agencies.

VITAL CITY, VITAL CHILDHOOD: YOUNG PEOPLE, COMMUNITY AND RESTORATIVE PRACTICES

256
Pia Christensen
This paper presents on-going UK research into urban gardening as a restorative practice. This paper examines some commonly recognised inter- and intra-generational community tensions and conflicts and discusses the potential for the engagement of children and young people in urban gardening movement activities as a way to transform (or exacerbate) such relationships.

ATTITUDES OF JUDGES ABOUT ALTERNATIVE SYSTEMS OF JUVENILE JUSTICE
Martha Frías Armenta
The purpose of this study was to examine the attitudes of judges or lawyers of the courts in relation to the acceptance of alternative measures in juvenile justice systems. The results show that attitudes had a direct effect on the acceptance of the alternative measures, whereas the social norm affected attitudes. The results show the importance of the psychological variables in the prediction of decisions making of the judges and other law professionals of the courts.

VICTIM-OFFENDER MEDIATION AND JUVENILE JUSTICE. PROCESS AND OUTCOME ANALYSIS
Giancarlo Tamanza, Marialuisa Gennari
In this paper we present and discuss a training program aimed to support the improvement of a Juvenile Mediation Service. It runs over three years, and it was divided into three distinct steps: a phase of evaluation research on the process and outcomes of undertaken activity; a supervising of the meditative practice; a phase of training about the operation mode of the working group.
Ahead of time, L. Vygotsky proposed to study the mechanisms of mental development of human by experimental genetic method the main task of which was the experimental reproduction of any higher form of behavior as a process. Such process was taken in motion and going from the process to its individual moments, that just fits into Post-non-classical paradigm of modern scientific rationality. Continuity of the research subject is viewed in Vygotsky’s reasonable ideas about the social situation of mental development, its actual and proximal zone of development, general laws of normal and abnormal development: periodicity, new formations (metamorphosis) development, unevenness of each period, the main lines of development and unity in the process of evolution and involution in the development of psyche that are common for the different levels of psyche (human and animal). The law of construction of higher mental functions, their indirection by cultural mediations, interpersonal character of the human psyche development and the role of mediator in this process, and also the idea of a child’s active interiorization of a cultural content as a mechanism of his/her social development made available not only the study of higher mental functions of human consciousness, which is subjective in its nature, but also study of psychological content of the human self-consciousness (its meanings, values and narratives), the formation and development of which forms a modern perspective ‘apical psychology’ of personality, which Vygotsky was dreaming about, and the object of which is defined as the development of humanistic in person in the process of socialization. The essence of socialization is the development of a man through the mediation of other people's cultural content that becomes internally psychological content of the individual psyche. Social content provides mediation of human mental activity by specific cultural tools (signs and meanings, symbols and myths). As a result, there are opportunities for the personal self-organization and coherent organization and coordination of the joint actions of people.

DEVELOPMENT OF INTEGRAL PERSONALITY IN THE DYNAMICS OF SOCIAL CHANGES

Olena Vlasova

On the basis of cultural-historical approach it was designed an innovative concept of the processes of personality socialization in conditions of social changes. The model opens a possibility of creation effective complex scientific-research projects (psychological, educational and cultural) and scientifically reasonable practices in the present-day challenging situation in the global society.
CULTURAL-HISTORICAL APPROACH IN RESEARCH OF HUMAN READINESS TO ACTIVITY
Oleg Panchenko, Lyudmyla Panchenko, Mariya Garazha

It is well-grounded that one of the important directions of the contemporary researches within the cultural-historical approach is the evaluation of a human readiness to activity, definition of its psycho-physiological criteria, and the time necessary for the attitude change. Introduction of the research results should occur in attaching obligatory dynamic control of the state of a human readiness to the work in dangerous, extreme and stressful conditions.

PERSONALITY SELF-REALIZATION IN THE CONTEXT OF HISTORICAL PSYCHOLOGY
Oksana Yaremchuk

Personal self-development is investigated as a creative process of self-realization in cooperation with other people. It occurs through interiorization of the sign systems for interpretation of various cultural texts and synthesizing personal meanings. Research method: psycho-historical reconstruction. The social and psychological concept of ethno-cultural myth-creativity of personality and community not only justifies the sign symbolic determination of consciousness but also makes it possible to interpret the sign as a tool for self-expansion of consciousness in the cultural and historical perspective. Overall, a person creates his/her own texts using the imposition of cultural matrices on the chain of life situations. It creates a “canon” of favorite and experienced as real concepts, texts, stories, characters, coping strategies, etc. On the basis of this canon we designed the self-construction of a person for implementation of the new life projects.

DIGITAL SOCIETY AS A CULTURAL CONTEXT OF PSYCHIC DEVELOPMENT OF STUDENTS
Regina Erchova

One of the negative consequences of child development in a digital society is a digital dementia meaning a deterioration in cognitive (attention, memory) and emotional abilities. The main task of the research focuses on investigation of the cultural context (digital society) and its influence to psychic development of person. Data were collected with binocular synchronous pupillometry method, and the sample consisted of 466 students.

SOCIALIZATION OF ORGANIZATION PERSONNEL IN THE PRESENT SOCIAL-CULTURAL SITUATION
Andrii Trofimov

Peer-to-peer strategy promotes personnel participation and interaction and stimulates creative ways of thinking, team working and interpersonal communication and forms an environment for the joint study and cooperation in organization. Research methodology includes Organizational Commitment Questionnaire (Porter, 1979), Management Style in Organization (Zakharov, 1999), Interpersonal Relations Test (Leary, 1954), Level of Organizational Culture (Ladanov, 1997), Emotional Intelligence Test (Hall, 2002). The sample is 45 organization employees. The forming experiment has been based on the technique ‘Peer Learning Circles’ which is a peer-mentoring scheme. It develops personal objectives and motivation, time-management skills and personal activity strategies, critical thinking, team building, leadership and effective communication, reflective psychological readiness to share an experience with the beginners, keen motivation for personal development and life-long learning demanded by the present social-cultural situation.
COPING WITH PROFESSIONAL STRESS IN THE OPEN CULTURAL-EDUCATIONAL ENVIRONMENT
Svitlana Paschenko

The objective of the research is defining the role of professional Self-concept in developing strategies of coping with professional crises in university lecturers. Coping strategies could moderate relationship between excessive professional demands and positive and negative effects of professional activity including job satisfaction, somatic and affective symptoms, psychological distress and burnout. The method is a standardized inventory for exposure of professional crisis and coping factors in lecturers (Gerasimova&Chorosova, 2006). N=302. Lecturers with such coping strategies as targeting new intentions for development, finding self-control and purposes can resist the negative impact of crisis on the affective component of professional self-awareness. Those professors who have a low level of ego-centered self-actualization, self-evaluation of leadership characteristics, orientation to avoidance and ownership and high level of development of various aspects of value component of professional self-awareness, socio-oriented self-actualization, pedagogical and psychological knowledge, professional and globalization identity are the most successful in resisting to the negative impact of professional crises and turn it into coping strategies.
PS107
EXAMINING LEARNING AND TRANSFER IN CHILDREN BY USING PROBLEM-SOLVING TASKS

The study of transfer and scientific reasoning skills is a central matter of research for cognitive and educational psychologists. There is a good agreement that children are able to reasoning scientifically from youngest infancy onwards (Gopnik, 2012). However, learning is not only about acquisition of information, but also about adapting what has been learned to novel situations (Bransford & Schwartz, 1999). This phenomenon is called transfer. A common aspect in the studies on transfer is the interest in how learning can be generalized to other contexts.

The main aim of the present symposium is to provide analyses of transfer in children (between the ages of 4 and 10-years) in problem solving situations with repeated measurement designs. In contrast to the traditional single-measurement designs, this approach shows the variability as an important aspect of learning.

The studies presented in this symposium examine whether transfer is displayed in children's behavior during the solution of new problem-solving by using diverse viewpoints such as: near/far transfer, individual/dyadic, group/case studies, instructional/non-instructional, multimedia/hands-on tasks. In addition, the studies address different contents of transfer: naïve understanding about Arquimedes’s principle (AQP), air pressure (AP) and the use of control variable strategies (CVS). The results of these studies all demonstrate the advantages of using a microgenetic method to show the complex relationship of learning and transfer.

Transfer is explored in the three presentations as follows: First, the study of Rojas (University of Connecticut and Universidad Javeriana-Cali) examines far transfer in a group of 4-year olds by using a multimedia task on AQP. Secondly, the presentation of Guevara-Guerrero (University of Groningen) explores near transfer in four dyads of 5-year olds, using hands-on tasks about AP. Finally, the study of Ordoñez (Universidad del Valle) looks at near transfer of CVS in a group of 10-year olds building cars. Together these presentations offer new insights in transfer and provide suggestions about using real-time analysis in future studies.

QUESTIONING TRANSFER AND EMPOWERING TRANSFORMATION OF LEARNING
Tatiana Rojas, Scott Brown
We examine four year-olds’ transfer performance when functional context and modality were different in a Problem-Solving condition. We found better performance in the PS condition and evidence of the transformative character of learning and transfer.

THERE IS SPONTANEOUS TRANSFER? CHILDREN SOLVING HANDS-ON TASKS
Marlenny Guevara-Guerrero, Marijn van Dijk, Paul van Geert
By using a multiple case study, we examine the spontaneous transfer in dyads (M=5.15 years) solving three problem-solving tasks. We found that transfer emerged after adjusting solutions and did not increase between tasks, but showed variable paths.

DISCOVERING AND TRANSFERRING STRATEGIES IN THE CONTEXT OF EXPERIMENTATION

Oscar Ordoñez, Álvaro Iván Valencia

We examine the transfer of CVS in twenty-six children (M=10.7 years) solving two analogous tasks. Results showed that CVS used at the beginning of each task were highly variable, indicating that children used various approaches to solve the problem.
PS108
CROSS-CULTURAL INVESTIGATIONS OF COGNITIVE AND SOCIO-EMOTIONAL DEVELOPMENT

B02. Development and education - School adjustment, academic achievement and learning disabilities
B09. Development and education - Adolescent adjustment
B10. Development and education - Parenting
B11. Development and education - Temperament and individual differences

Convenor  Sergey Malykh, Russian Academy of Education, Moscow - Russian Federation
Presenters  Victoria Ismatullina, Russian Academy of Education, Moscow - Russian Federation
           Ivan Voronin, Russian Academy of Education, Moscow - Russian Federation
           Tatiana Tikhomirova, Russian Academy of Education, Moscow - Russian Federation
           Darya Gaysina, University of Sussex, Brighton - United Kingdom
           Georgy Vasin, Russian Academy of Education, Moscow - Russian Federation

Discussant  Darya Gaysina, University of Sussex, Brighton - United Kingdom

The aim of this symposium is to present results of and reflect on cross-cultural investigations of cognitive and socio-emotional development from childhood through the transition to adulthood. The symposium consists of five presentations that focus on different psychological traits that are central in the second decade of life: general cognitive ability, school achievement, personality, and mental health. The proposed papers use samples drawn from various countries that have been found to differ in terms of their socio-economic status, as well as cultural values, social norms, beliefs, and traditions. All five papers include samples from the Russian Federation and Kyrgyz Republic. In the first paper, the authors present the results of cross-cultural examination of working memory in two samples of Russian and Kyrgyz adolescents. In the second paper, the authors analyse the links between five personality traits and general cognitive ability highlighting the effect of culture, in two samples of Russian and Kyrgyz adolescents. In the third paper, mother-child interactions are examined as predictors of children’s school achievement, paying attention to cultural similarities and differences of these relationships in three countries: the UK, Russia, and Kyrgyzstan. In the fourth paper, the associations between parenting practices and offspring emotional and behavioural problems are investigated in samples of young adults from the UK, Greece, Russia, Kyrgyzstan, and Brunei. Finally, in the fifth paper, a genetically-informative cross-cultural approach is undertaken to get insight into aetiology of the relationship between temperament and behavioural problems in adolescents from two countries – Russia and Kyrgyzstan. These five presentations will provide a basis for a general discussion on the importance of interdisciplinary approaches to studying individual differences in cognitive and socio-emotional development in different countries.

CROSS-CULTURAL STUDY OF WORKING MEMORY IN ADOLESCENTS
Victoria Ismatullina
Working memory (CANTAB) was assessed in a sample of 289 adolescents from Russia and Kyrgyzstan. Findings of this research will be discussed focusing on cultural similarities and differences in cognitive development.

RELATIONSHIP BETWEEN “BIG FIVE” PERSONALITY TRAITS AND GENERAL COGNITIVE ABILITY IN RUSSIAN AND KYRGYZ ADOLESCENTS
Ivan Voronin
Associations between “Big Five” personality traits and Raven’s Progressive Matrices g score were tested in Russian and Kyrgyz adolescents (N=206) and appeared to be weak or moderate. Association between g and Conscientiousness differs in two countries.

**MOTHER-CHILD INTERACTIONS AND CHILDREN’S SCHOOL ACHIEVEMENT: UK-RUSSIA-KYRGYZSTAN CROSS-CULTURAL INVESTIGATION**
*Tatiana Tikhomirova*
The results of a cross-cultural study of interrelationship between mother-child interactions and child’s school achievements in the three samples (N=1375) of 11-14 year-old schoolchildren in the UK, Russia and Kyrgyzstan will be presented.

**PARENTING PRACTICES AND INTERNALISING AND EXTERNALISING SYMPTOMS IN YOUNG ADULTS FROM FIVE COUNTRIES**
*Darya Gaysina*
Associations between parenting practices and offspring internalising and externalising symptoms were tested in British, Greek, Russian, Kyrgyz, and Brunei young adults. There is evidence for both country-specific and country-common effects of parenting.

**IS THE RELATIONSHIP BETWEEN TEMPERAMENT AND BEHAVIOR PROBLEMS INFLUENCED BY GENES OR ENVIRONMENT? EVIDENCE FROM A RUSSIAN-KYRGYZTWIN STUDY**
*Georgy Vasin*
Temperament traits and behavior problems are interrelated. What are the mechanisms underlying this relationship? In our study we analyze the extent to which genetic and environmental factors influence this relationship in two different cultures.
MENTALIZATION AND PARENTING: SOME CONSIDERATIONS ABOUT REFLECTIVE FUNCTION AND SUGGESTIONS FOR FUTURE RESEARCHES

In the last 30 years many researchers have underlined the relevance of mentalization, especially in mother-child relationship as it can be considered the capacity to treat the child as a psychological agent and it fosters child development (Meins et al., 2002; Sharp & Fonagy, 2008).

Child development either relational or cognitive or emotional has been linked to this parental ability. More specifically, mentalization has been suggested to have a specific role in intergenerational attachment transmission as infantile experiences with caregiver can be considered a base for the child's attachment security, physical and socio-cognitive development (Sharp & Fonagy, 2008; Rothschild et al., 2010).

Several constructs aiming to explore parental mentalization have been proposed in diverse backgrounds.

In particular in a psychoanalytic framework Fonagy and collaborators (Fonagy, Gergely, & Target, 2007; Fonagy, Steele, Steele, Moran, & Higgitt, 1991; Fonagy & Target, 1997) have proposed the concept of reflective function (RF) which can be defined in mother-infant relationship as: the parent's capacity to reflect upon her own and her child's internal mental experiences (Slade, 2005). More generally RF has achieved a major role in several studies about personality formation and disorders, adolescence and treatment (Bateman & Fonagy, 2004; Benbassat & Priel, 2012; Fonagy, Gergely, Jurist, & Target, 2003; Fonagy & Target, 1998). In the context of mother-child relationship, another operationalization which has been suggested to be relevant is called maternal Mind-Mindedness (Meins, Fernyhough, Fradley, & Tuckey, 2001).

The symposium can be considered an occasion to deepen some infantile evolutive aspects related to RF and to share critical knowledge and thoughts based on recent studies about mentalization, and more specifically RF and its relationship with MM. Furthermore it aims to suggest reflections and ideas for further studies either theoretical or empirical.

MENTALIZATION AND OVERWEIGHT - HOW FAR GOES THE INFLUENCE OF MATERNAL REFLECTIVE FUNCTIONING?
Anja Keitel-Korndörfer, Verena Wendt, Annette M. Klein, Kai von Klitzing

In the first contribute, Keitel-Korndörfer will discuss the role of maternal Reflective Function comparing a sample of overweight mothers with normal-weight ones and she will reflect on the relationship between RF and child's weight.
MATERNAL MENTALIZATION: ARE REFLECTIVE FUNCTION AND MINDMINDEDNESS RELEVANT CONSTRUCTS IN INVESTIGATING MOTHER-INFANT RELATIONSHIP AND CHILD ATTACHMENT?
Chiara Giovanelli, Lucia Carli
In the second contribute, Giovanelli will present a study conducted to compare RF and Mind-Mindedness in a normative sample and she will analyze its results. Moreover she will share some thoughts about the concept of mentalization and the constructs of RF and MM.

PARENTING, MENTALIZATION AND EPISTEMIC TRUST - TOWARDS THE NEXT LEAP IN EMPIRICAL RESEARCH
Alex Desatnik
In the third contribute, Desatnik will discuss the concept of mentalization and RF and he will introduce the idea of epistemic trust as a part of a triadic model with RF and attachment.
Citizenship is a common characteristic of modern states extending rights to members and guaranteeing certain protection. In return citizens have obligations to the state for these benefits. Yet the political behaviour of citizens does not always reflect this ‘citizenship contract’. Individuals often feel the need to protest in different ways to assert rights they believe are not being addressed. The reasons for doing so are not always clear. Sometimes there are individual causes related to personality and a sense of alienation while at other times there are social causes related to perceived injustice and entitlements. This symposium will explore how the citizenship attitudes of young citizens in selected Asian and European countries are shaped, how young people view their future political participation and values and whether the traditional ‘citizenship contract’ is under threat.

Survey data was identified focusing on young people’s attitudes to citizenship including the International Civics and Citizenship Education Study (ICCS), the World Values Survey and two European Citizenship Research Projects. The focus was on identifying those variables within different country contexts e.g. personality, attitudes to the nation, political trust, attitudes to equality, political efficacy etc. that accounted for the way young people see their future political participation.

The results indicated that young people from European countries tended to endorse future political behaviour that was more politically oriented that those from Asian countries, they were less influenced by patriotism but were similarly committed to equality as their Asian peers. The comparisons across cultures and political systems showed the importance of contexts that influence citizenship values and the difficulty of generalizing across cultures.

HONG KONG STUDENTS’ ATTITUDES TO PROTEST

*Kerry Kennedy*

Successive international research shows that young Hong Kong students show little interest in political engagement, more interest in social engagement and a rejection of illegal protest. Yet ten years later the same students engage in illegal activities in order to advance the cause of democracy. This paper will draw on quantitative and qualitative data to try and explain these changing political behaviors.

YOUNG EUROPEANS’ CITIZENSHIP BEHAVIORS ACCORDING TO THEIR AGE

*Beata Krzywosz-Rynkiewicz*
Citizenship attitudes develop from early adolescence. Based on research with 3794 students aged 11-14-18 from 11 European countries we found developmental regularities of citizenship activity: passive and personal citizenship tends to increase with age; there is also general decline in participatory behavior, although a willingness to protest.

PERSONALITY CONSTRUCTS AND CITIZENSHIP DIMENSIONS OF YOUNG POLES
Anna Maria Zalewska
In a study (Grant ESF/84/2006) we found that general citizenship behaviour and its five dimensions – passive, semi-active, social, personal and change-oriented (excluding political activity) – was predicted by various personality constructs from among Big Five traits and social-cognitive beliefs – optimism, values, mental toughness, responsibility.

CIVIC ENGAGEMENT OF YOUTH IN RUSSIA
Olga Mitina, Nina Nizowskii
Russian Enlightenment thought accumulated ideas about the formation of citizenship and civic activity, then in specific way they were adopted in SU. Today society doesn’t pays attention to this part of education and socialization. The study identified the representations of Russian contemporary youth on these issues

ASIAN STUDENTS’ CIVIC BEHAVIOURS AND ATTRIBUTES AND THEIR AFFECT ON CIVIC KNOWLEDGE
Joanna Li Lijua
Civic action occurs as a result of the interaction of students’ citizenship attitudes and behaviours. This paper identifies attitudinal and behavioural factors affecting Asian students’ civic knowledge at both individual and school levels. Both direct and indirect effects are examined. Data is drawn from the ICCS involving five Asian societies.
PS111

CLINICAL SUPERVISION AROUND THE GLOBE: PRACTICES, EFFICACY, AND REGULATION

E01. Health and clinical intervention - Assessing and accrediting quality of psychotherapy training and practice

Convenor  Nadine Kaslow, Emory University, Atlanta - United States
Presenters  Carol Falender, UCLA University of California, Los Angeles - United States
Anthony Pillay, University of KwaZulu-Natal, Durban - South Africa
Analise O’Donovan, Griffith University, Brisbane - Australia
Nadine Kaslow, Emory University, Atlanta - United States
Discussant  Carol Falender, UCLA University of California, Los Angeles - United States

Clinical supervision has only recently been acknowledged as a distinct professional competency. This symposium will address the various global challenges and advances in training, guidelines, and practices of effective supervision. Although clinical supervision is the cornerstone of clinical training and transmission of the profession and its practices to future generations, internationally, psychology has relied upon the process of osmosis for supervision and has addressed neither the quality nor criteria for successful supervision. Within the past decade multiple countries have begun to remedy this situation by developing guidelines for clinical supervision and by developing regulatory and training criteria. Presenters in this symposium will address state of the art of clinical supervision through the lens of multiple countries, cultures and viewpoints: Australia, South Africa, and the United States. Subjects will include the state of the art of supervision guidelines and standards, regulatory perspectives, effective supervision practices, and the trajectory of supervision training. Critical questions include a) assessment of competence of the supervisor; b) training procedures and requirements to conduct clinical supervision; c) existence of guidelines, ethical standards, or regulations that directly address clinical supervision; d) research on supervision in the various contexts and how they address and inform the areas of practice; e) consideration of outcomes of supervisee development and competence and client outcome.

Objectives:
1) Identify common factors across global settings in the practice and regulation of clinical supervision
2) Identify strengths, commonalities, and variants in guidelines, regulations, and training across global settings
3) Describe consensual themes on effective clinical supervision

SUPERVISION GUIDELINES IN GLOBAL PERSPECTIVE
Carol Falender
Supervision Guidelines were adopted in 2014 in the United States. Commonalities and cultural variants, legal, ethical, and regulatory considerations will be discussed as well as the Western influence on global supervision.

CHALLENGES AND PROCESS: SUPERVISION IN SOUTH AFRICA
Anthony Pillay
Supervision issues and challenges in professional psychology training in South Africa. While supervision in professional psychology training has many universal challenges, countries like South Africa, in social and political transition, have some unique issues influencing the supervision process, content and dynamics.

CLINICAL SUPERVISION AND MANDATORY TRAINING: A VIEW FROM AUSTRALIA
Analise O’Donovan
In 2010, the Australian Psychology Registration Board introduced mandatory supervisor training. Workshop content, effective and ineffective supervisors, and supervisee feedback about supervision in the Australian context will be described.

EFFECTIVE SUPERVISION, CULTURE, AND COMPETENCE
Nadine Kaslow
One of the most challenging aspects of effective supervision relates to supervising trainees with problems of professional competence. The interface between competence problems and multicultural factors will be explored.
PS112
AGEING AND MIGRATION IN EUROPE

C18. Culture and society - Other

Convenors  Isabelle Albert, University of Luxembourg, Luxembourg - Luxembourg
Dieter Ferring, University of Luxembourg, Luxembourg - Luxembourg

Presenters  Vanessa Burholt, Swansea University, Wales - United Kingdom
Stephanie Barros Coimbra, University of Luxembourg, Luxembourg - Luxembourg
Tineke Fokkema, University of Groningen, Groningen - Netherlands
Anne Carolina Ramos, University of Luxembourg, Luxembourg - Luxembourg
Dieter Ferring, University of Luxembourg, Luxembourg - Luxembourg

Discussant  Beate Schwarz, University of Zurich, Zurich - Switzerland

Ageing and migration have become key topics in Europe today, as a large number of first generation immigrants of the 1970s are currently approaching retirement age in many European countries. Although the idea of return migration might often be well present in the lives of ageing migrants, an actual permanent return to the country of origin seems to be enacted more seldom by today’s immigrants after retirement. This might be due to several reasons such as social aspects (e.g., family and friends), economic issues or health. It is therefore of prime importance to learn more about the particular needs and resources of older migrants and their families. Ageing migrants face undoubtedly a special situation: The acculturation situation may result in an increased need for social support due to fewer sociocultural resources in the host country; however, they may also have a smaller social network due to difficulties in adapting to the host country. Within migrant families, an acculturation gap between first and second generation might further lead to different expectations regarding intergenerational solidarity and support, and this can have negative effects on well-being of the different family members. Issues of assistance and care for aged migrants will thus be crucial both for the receiving society which has to address issues of diversity, integration and social cohesion, as well as for families which provide still the lion’s share of support for the aged. Policy makers and practitioners are conscious of the increasing importance of these issues, but more research is needed in order to improve the provisions of age-specific services and assistance for ageing migrants and their families. The present symposium aims to put issues of migration and ageing on the agenda and to raise the awareness of these hot topics in today’s society. It brings together leading researchers in the field of ageing and migration from four different European countries which are characterized by a large share of immigrants in their population, namely UK, Luxembourg, the Netherlands and Switzerland. Contributions will focus on different, country specific immigrant (and national) groups, examining aspects of ethnic identity and multiculturalism, intergenerational relations, social networks, support and care as well as different aspects of well-being in the context of acculturation. Both quantitative and qualitative methodologies will be applied. The presented studies will be discussed with respect to similarities and differences between immigrant groups and different acculturation contexts, and implications for policies regarding ageing and migration in Europe will be considered. Further, lacks in current knowledge will be addressed and suggestions for future research activities will be presented.

TRANSNATIONAL FAMILY RELATIONSHIPS AND CULTURAL IDENTITY: OLDER MIGRANTS IN ENGLAND AND WALES

Vanessa Burholt, Christine Dobbs, Christina Victor
Social identity theory illustrates older UK migrants’ belonging to an ethnic group, country of origin of family, and the UK. We explore the influence of cultural heritage, social class, support network and global citizenship on cultural identity.

MULTICULTURALISM OF PORTUGUESE OLDER MIGRANTS AND THEIR ADULT CHILDREN IN LUXEMBOURG
Stephanie Barros Coimbra, Isabelle Albert, Elke Murdock, Dieter Ferring
Addressing the issue of an acculturation gap between generations of migrants, we focus on ethnic identity, multicultural ideologies, acculturative stress and well-being of Portuguese older parents compared to their adult children in Luxembourg.

LONELINESS AMONG MOROCCAN AND TURKISH OLDER MIGRANTS IN THE NETHERLANDS
Tineke Fokkema, Theo van Tilburg
Migrants might have difficulties to adapt to their new society and integrate socially. The current study explores feelings of loneliness in 475 people born in Turkey or Morocco, aged 55-64, who migrated more than thirty years ago to the Netherlands.

LONG-TERM CARE PERSPECTIVES AMONG ELDERLY MIGRANTS: THE CASE OF LUXEMBOURG
Ute Karl, Boris Kühn, Anne Carolina Ramos
Based on biographic and network interviews, this paper analyses the long-term care perspectives among elderly migrants in Luxembourg. It shows their preference for paid care work and challenges related to language, culture and social isolation.

“THIS IS NOT MY TOWN”: FEELINGS OF CLOSENESS AND SECURITY OF OLDER MIGRANTS AND NATIONAL RESIDENTS
Dieter Ferring, Thomas Boll
The study demonstrates differences in ratings of closeness to one’s living area and of feeling secure out of the perspective of older Portuguese migrants and national residents. Results are discussed regarding processes underlying acculturation.
PS113
SOCIAL ROBOTS AS OUTGROUP: SOCIAL AND COGNITIVE PROCESSES IN RELATIONS TO SOCIAL ROBOTS

C05. Culture and society - Group processes and intergroup relations

Convenor Roger Giner-Sorolla, University of Kent, Keynes College, Canterbury - United Kingdom
Presenters Friederike Eyssel, New York University, Abu Dhabi - United Arab Emirates
Francesco Ferrari, University of Trento, Trento - Italy
Maria Paola Paladino, University of Trento, Trento - Italy
Ceylan Özdem, Vrije Universiteit Brussel, Brussels - Belgium
Discussant Roger Giner-Sorolla, University of Kent, Keynes College, Canterbury - United Kingdom

Worldwide, in the past decade, there has been a sharp increase in investment into the development of sophisticated social robots. But this is not matched by an equivalent level of progress in the studies that investigate the reactions of humans toward this novel social group of our own creation: the robots. Our symposium will redress this neglect by showcasing recent advances in psychological research on robots as “outgroup”. Focusing on robots that resemble human beings (humanoids and androids), we will present research into the psychological processes relevant to their acceptance in social interaction.

Friederike Eyssel will present studies showing how and when the processes of dehumanization and anthropomorphism occur in the context of human-robot interaction.
Francesco Ferrari will present a set of studies based in intergroup theory, demonstrating that people fear highly human-like appearance in robots because they are perceived to pose a threat to human beings’ distinctiveness.
Maria Paola Paladino will address the same issue but from a different angle. Using a well-developed social cognitive theory, processes she will present studies investigating the role of Category Conflict in negative emotional reaction toward highly anthropomorphic robots.
Ceylan Özdem will discuss her research showing the interaction between two processes involved in human-social robot interaction, namely attentional reorientation (cognitive) and attribution of agency (social). In addition to behavioral responses this study also investigated neural correlates of interaction with social robots.

The discussant, Roger Giner-Sorolla, an expert in social emotions and dehumanization, will underline how, across different lines of research, psychological theories and research are fundamental to developing more “human friendly” social robotics. At the same time he will also explain how this research represents a challenging laboratory for basic social psychological theories.

FACTORS = HUMANITY?
Friederike Eyssel
We will present experimental evidence on two prominent social psychological phenomena: anthropomorphism and dehumanization. The underlying mechanisms will be discussed using the 3-Factor Model of Anthropomorphism (Epley et al., 2007).

FEAR OF SOCIAL ROBOTS: PHYSICAL ANTHROPOMORPHISM AS A THREAT TO HUMAN DISTINCTIVENESS AND IDENTITY
Francesco Ferrari
Social robots generally are feared for economic reasons as they replace workers. Referring to research on group distinctiveness, we demonstrated that fear toward robots is more generally linked to the threat to human specificity and identity.

IS IT A ROBOT OR IS NOT? THE ROLE OF CATEGORY CONFLICT IN THE UNCANNY VALLEY
Maria Paola Paladino
According to the uncanny valley theory, very human-like robots can be threatening and cause fear in interactions. The three studies presented here investigate the role of category conflict as a cognitive process responsible for this phenomenon.

BELIEVING ANDROIDS? ATTENTIONAL REORIENTATION AND BELIEF MANIPULATION WITH AN ANTHROPOMORPHIC ROBOT
Ceylan Özdam
The present study investigated the potential interaction between the processes of attentional reorientation (cognitive) and attribution to agency (social) and explored its neural substrate by using a picture of an anthropomorphic robot.
PS115
IDENTIFICATION WITH GROUPS FROM FRONT TO COVER: ITS STRUCTURE, MOTIVATIONAL BASIS AND DIFFERENTIAL EFFECTS

C05. Culture and society - Group processes and intergroup relations

Convenor Andrey Elster, The Hebrew University of Jerusalem, Jerusalem - Israel
Presenters Avihay Berlin , The Hebrew University of Jerusalem, Jerusalem - Israel
Andrey Elster, The Hebrew University of Jerusalem, Jerusalem - Israel
Eyal Rechter, Columbia University, New York - United States
Sonia Roccas, The Open University of Israel, Raanana - Israel
Noga Sverdlik, Ben-Gurion University of the Negev, Beer-Sheva - Israel

Social groups consider members' identification as an immeasurable asset and invest considerable efforts in promoting members' affiliation and commitment. Identification provides various benefits, both to the group (e.g., contribution, loyalty) and to its members (e.g., sense of belonging, self-esteem). The proposed symposium aims to deepen our understanding of the concept of identification, by examining its structure, motivational basis, and contextual factors that mitigate its effect. The first two presentations focus on motivational bases underlying identification. The first examines individual differences in values as predictors of identification over time: Members' values and the values they perceived as expected had a unique contribution. The second presentation studies the opposing effects of locomotion vs. assessment orientations, beyond satisfaction with the leader. Identification, however, is not a uniform construct. The third presentation differentiates between two forms of identification and aims to uncover their motivational and perceptual underpinnings. The fourth presentation shows that attachment and glorification forms of identification differ in their impact on psychological discomfort following violations of personal beliefs by ingroup actions. Finally, the last presentation points to contextual factors affecting outcomes of identification, and shows the moderating role of one's close environment in the relation between identification and membership satisfaction.

The presentations differ in the nature of studies (field and lab), methodology (correlational, longitudinal, multilevel designs) and context (nation, organization, sports teams). Taken together, the research included in this symposium furthers the comprehension of a fundamental concept in social reality - identification with groups. Our joint contributions can be utilized by theoreticians and practitioners to manage and maintain positive relations between individuals and social collectives.

PERSONAL VALUES AND PERCEIVED EXPECTED VALUES PREDICT ORGANIZATIONAL COMMITMENT AMONG VOLUNTEERS

Noga Sverdlik, Tali Rabin

In a longitudinal study among volunteers in a prosocial organization, we found that both personal values and values perceived as expected by the coordinator and the protégé in time 1 predicted organizational affective commitment in time 2.

THE RELATIONSHIP BETWEEN REGULATORY MODE AND AFFECTIVE COMMITMENT
Eyal Rechter
Participants were 205 female players of a community sport league. Locomotion (positively) and assessment (negatively) predicted affective commitment to the team, over and above satisfaction with the coach.

LOVE VERSUS LOVING CRITICISM: DISENTANGLING CONVENTIONAL AND CONSTRUCTIVE PATRIOTISM
Sonia Roccas, Maciej Sekerdej
Three studies of Polish and Israeli students seek to disentangle conventional and constructive patriotism by examining perceptual and motivational mechanisms that differentiate between them.

INGROUP IDENTIFICATION AND NEED FOR COGNITIVE CLOSURE INTENSIFY INTRAGROUP DISSONANCE
Avihay Berlin
Identification in the form of attachment (but not glorification) and Need for Cognitive Closure both had a unique contribution in predicting psychological discomfort following a violation of personal beliefs by ingroup actions.

THE MODERATING EFFECT OF UNIT SUPPORT CLIMATE ON THE RELATIONSHIP BETWEEN IDENTIFICATION AND JOB SATISFACTION
Andrey Elster, Lilach Sagiv
Two studies show that the relationship between identification and job satisfaction depends on the unit-level climate: This relationship is significantly stronger in units with a weak support climate as compared to units with a strong support climate.
The university extension has a key role in enabling students training to bring together the community and academia. It opens up perspectives for the everyday reality and offers a field in which the relationship between students and community become valued, allowing the development of a more dynamic academic curriculum, more tuned with the social demands. It is observed that the passage through this experience produces a transformative effect of both the existential and intellectual points of view. In addition, it is clear that such actions contribute to reduce the imaginary inequalities and the gap between the privileged academic world and reality. Being cooperative processes, such activities provide a fruitful field for coordinating professors and scholarship students to develop new research with issues of strong socio-political nature, that can be a source of resources and tools creation for effective transformation of the groups involved. We intend to present actions of different extension projects at the Federal University of the State of Rio de Janeiro, Unirio-Brazil. In this symposium we held a cutout, prioritizing actions concerning people with special needs, college students and young graduates of our university. The methodologies applied are articulated through Research-Action, valuing the involved subjects, whether they are the fellows who work with us or those served by the various projects. At the work "Mazes and skills: the choices of Pedagogy students" our approach goes through the career choices narratives. In "Interlacing knowledge: some practice impasses" we focus on the crises faced by the students when confronted with the professional field. In "Social inclusion of young people and adults with disabilities: changing attitudes" we discuss the work in an institution that attends youth and adults with intellectual and multiple disabilities.

MAZES AND SKILLS: THE CHOICES OF PEDAGOGY STUDENTS
Lucia Maria de Freitas Perez
The "Mazes and Skills" project makes video records of student testimonials about their career choices. They are presented to others, leading to processes of reflection and discussion on the reasons that lead to such choices.

SOCIAL INCLUSION OF YOUNG PEOPLE AND ADULTS WITH DISABILITIES: CHANGING ATTITUDES
Sandra Albernaz de Medeiros
The title-paper discusses an extension project developed by the Institute of Clinical, Educational and Professional Psychology and meets youth and adults with disabilities.

INTERLACING KNOWLEDGE: SOME PRACTICE IMPASSES
Vera Regina Loureiro
The project aims to build a network of sensitive listening and to weave ties with educators in order to create multiple spaces of intersection and discussion, both in classroom and virtual, to address the inherent difficulties of the educational act.
Leadership and motivation are the two central topics of organizational behavior which attract both academicians and practitioners alike. Motivation is essential for keeping the employees engaged and leadership is essential to show the direction and taking the responsibility motivating self and others. Leadership has been dealt by researchers in multiple ways due to their diverse backgrounds. The symposium addresses the primary question: to what extent do the leadership styles matter in determining employee related outcomes. The study of leadership becomes more important from Indian perspective as India offers unique cultural context due to its collectivist nature and high power distance. While examining the role of leadership in shaping various employee related outcomes, we have used multiple perspectives on leadership including autocratic vs participative leadership, transactional vs transformational leadership, equity perspective on leadership and empowering leadership. Employee related outcomes may consists of job satisfaction, organizational commitment, employee engagement, job involvement, task performance and contextual performance and job related strain and intention to quit. The major hypotheses tested in the studies are: a. social inequity may be perceived not only in terms of financial rewards, but anything that the person subjectively considers as rewarding, the nature of which may be related to personal values. b. transformational leadership would be positively related to work engagement and psychological wellbeing among managers. C. leadership style would have greater influence on employee attrition than organizational performance. The researchers have followed both experimental and survey method to examine their hypotheses using appropriate samples and measurement tools. The studies included in symposium have followed social exchange theory in general and equity theory in particular to integrate their findings. The studies have concluded that the leaders play a strong role in shaping employee related outcomes. Theoretical and practical implications of the studies have been discussed. Limitations and future directions have also been suggested.

LEADERSHIP WITH PASSION: EQUITY MOTIVATIONAL FOUNDATION OF LEADERSHIP
Arvind K. Sinha

Author and associates discovered that social inequity may be perceived not only in terms of financial rewards, but anything that the person subjectively considers as rewarding, the nature of which may be related to personal values. An intense or frequent reinforcement of over-reward occurrences may lead to a strong inclination toward a self-defining activity that one likes or loves, is part of professional position such as leadership roles. Such an inclination has been termed in the literature as “passion”. Using the variables of social inequity and competence, the contribution of “over-rewarding” inequity
on effective organizationally relevant behaviour (with passion nurturing outcomes as the reward) was investigated. Sample consisted of 100 senior undergraduates and 100 pass outs alumni of a technological university, and 80 professionals working in banks. Data analysis comprised of interview data, exploratory factor analysis and regression analysis. Results suggested that an “advantageous inequity” arising out of a basic psychological need of relatedness to some (or a larger) cause, and feeling of competence to make significant contributions to the profession and the humankind at large, may be related to passion, which might make a difference to the form and quality of leadership role enactment. People getting a chance to nurture their passion with such perceived advantage are also likely to be better contributors to the organizationally and possibly socially relevant outcomes.

THE IMPACT OF TRANSFORMATIONAL LEADERSHIP AND ORGANIZATIONAL CULTURE ON EMPLOYEE ENGAGEMENT AND PSYCHOLOGICAL WELL BEING

Kailash B. L. Srivastava

The major objective of this study was to examine the effect of transformational leadership on work engagement and psychological well being among managers. The data were collected from 325 managers through structured interview schedule using the self report method on employee engagement and psychological well being, psychological climate and perceived organizational support. The data on transformational leadership was filled up by the supervisors of the respective managers. The transformational leadership and organizational culture were treated as independent variable and psychological climate and perceived climate was treated as mediator and mediator variable, and work engagement and psychological well-being were considered as dependent measures. The results showed the direct effect of transformational leadership on employee engagement engagement and psychological wellbeing and also the indirect effect of psychological climate, showing its mediation effect. In addition, the research also indicates that transformational leaders are more effective if there is support from the organization resulting in better engagement and enhanced psychological well being. The findings have implications for managers that if leaders adopt the transformational style, they can easily develop a sense of trust and meaningfulness, which helps employees to better engage themselves, face challenges and develop themselves to create wellbeing. The theoretical and practical implications of the study are also discussed.

Key words: Transformational leadership, employee engagement, psychological climate, perceived organizational support, psychological well being.

FACTORS INFLUENCING EMPOWERING LEADERSHIP BEHAVIOR: A STUDY OF TEAM LEADERS’ LOCUS OF CONTROL, TEAM MEMBERS’ TASK CHARACTERISTICS, TENURE UNDER LEADERSHIP AND POWER DISTANCE

Manjari Srivastava, Ruta Vyas

The focus of the present research is to understand the factors influencing empowering leadership behavior, a perspective both from leaders and their team members. With the objective that organizations can focus on the right elements and invest in the appropriate areas during their leadership development activities.

The research is exploratory field study. Sampling is purposive, employing triadic design i.e. a manager and two of his/her subordinates are selected for data collection. The total no. of respondents is 240, with 80 managers and 160 of their direct reports.

The sample is drawn from seven professionally run organizations including those of Indian origin as well as multi-national companies. This study proposes to explore the relationship between leaders’ locus of control and his or her empowering behavior towards the immediate team and further explore the moderating impact of power distance on empowering behavior. Similarly the study also aims to explore if nature of task team members’ perform has any association with the empowering behavior of their leader and whether this relationship is moderated by power distance between them. Thirdly, whether tenure under a leadership influences the nature of task subordinates perform?

Exploratory and confirmatory factor analysis is done to establish the validity of the questionnaires. Further analysis would employ other multivariate techniques of quantitative data analysis.
The finding from this research may be utilized by professionals to guide organizations desiring rapid and sustainable growth, to develop leaders who empower their teams such that they act as leaders themselves and become stimulants for the growth of the organization. 

Key words: empowering behavior, team leaders, team members, locus of control, task characteristics, power distance, and team members’ tenure.

ORGANIZATIONAL LEADERSHIP FOR SOCIETAL WELFARE: ORGANIZATIONAL ENTRY, SOCIALIZATION AND SENSE MAKING

Bhumika, Arvind K. Sinha

The present work attempts to understand the role of organizational leadership in implementation of social welfare through a perspective known as sense-making, which may be thought of as a process by which individual develops the cognitive map of their environment. It is also a process that helps the organizational role incumbents in making decision about their own career graph including their intent to either remain with or quit the organization especially during the early socialization phase, typically during the first eighteen months on the job. Based on qualitative enquiry from the new role incumbents, who did not yet complete two years of continuous experience on the main job for which they had been selected in their respective cadres. Data collected from primary respondents using semi-structured interviews were analyzed through the grounded theory approach. Based on the insights gathered from the interviews, an attempt is made to advance a framework for understanding the process of sense making of the role of organizational leadership in societal welfare of the internal customers and bringing about the roles of (a) their unrealistic expectations and unmet expectations in prompting them for making a choice between intent to quit or to remain with the organization, and (b) the organizational socialization practices. The results are discussed toward a desirable emphasis on actual implementation rather than just identification and creation of policies, and for implications on part of the organization in the direction of enhanced rate of retention of the recruited role incumbents and their social-emotional welfare.

EFFECT OF LEADER BEHAVIOUR AND ORGANIZATIONAL PERFORMANCE ON EMPLOYEE ATTRITION

Shailendra Singh

Employee attrition has invited a great deal of attention from both academicians as well as from practitioners. A popular question often raised by managers- what causes employee attrition- the company or the leader? To respond to this debate, the study examines the impact of leader behaviour and organizational performance on employee stress and likely attrition. It was hypothesized that both leadership and organizational performance will have a significant impact on employee outcomes. However, leadership would likely have a greater impact on employee outcomes as it is the immediate supervisor who influences the work life of employee on day-to-day basis. For junior level employees, leader is the person who represents the organization. Eighty young managers responded to questions regarding their motivation, creativity, stress level and likelihood of attrition under a simulated environment in a 2X2X2 experimental design framework having two kinds of leadership, namely autocratic and participative and two types of organizational performance, namely, loss making and profit making, and two kinds of stimulus order : nature of leadership followed by organizational performance and nature of organizational performance followed by nature of leadership . Results strongly supported the hypothesis that leadership has a greater impact on employee related outcomes including likely attrition than organizational performance. Organizational performance also had a significant influence of likelihood of attrition but the magnitude of the influence was relatively smaller. The results give credence to the maxim that employees more likely to leave the organization because of their supervisors than because of their organization's performance or image. The implications for the theory and practice have been discussed.

Key Words: Stress, Attrition, Employee Outcome, Leadership Style, Organizational Performance
PS118
THE INTEGRATION OF NEUROSCIENTIFIC APPROACHES IN THE STUDY OF CONSUMER BEHAVIOR: THE CONTRIBUTE OF NEUROMARKETING

F13. EXPO 2015 Hot Topics - Neuroeconomics and neuropolitics

Convenor: Vincenzo Russo, IULM University of Milan, Milan - Italy
Presenters:
Carlos Flavian, University of Zaragoza, Zaragoza - Spain
Dominika Maison, University of Warsaw, Warsaw - Poland
Maurizio Mauri, IULM University of Milan, Milan - Italy
Daniela Zambardieri, University of Pavia, Pavia - Italy
Egle Vaiciukynaitė, Kaunas University of Technology, Kaunas - Lithuania
Discussant: Carlos Flavian, University of Zaragoza, Zaragoza - Spain

The aim of the symposium is to explore and discuss the application of neuroscientific approaches as innovative contribution to study consumer reactions. In the last decades the possibilities to take advantage of brain image techniques and the implementation of scientific knowledge about the brain allowed to understand and explain different cognitive and emotional processes involved in consumer phenomena (Plassmann et al., 2012) to such an extent that neuroscientists are able to directly study the brain processes to an unprecedented degree. However the fields of marketing, communication and consumer behavior studies, are still not aware about the neuroscientific advances and about their huge potential. The application of neuroscientific methods, such as the electroencephalography recordings, to market research, has caused controversial debate in the scientific community (Lee et al., 2007). The development of technologies that enable to measure many behaviors of consumers, such as the pointing of the gaze (eye-tracking), or the quantitative facial emotional expressions analyses, or the application of psychophysiological techniques based on the monitoring of the activity of autonomous nervous system (heart rate, respiration, electromyography, skin conductance) can provide important information that can be integrated with traditional methods of market research. However, despite the development of scientific disciplines such as Neuroeconomics (Rustichini, 2006), the rise of protocols or specific techniques enabling market researchers and professionals to take advantage of modern neuroscientific methods is still an open issue. The contributes presented during the symposium will discuss some case studies and some scientific considerations to widen the scopes of neuromarketing, beyond commercial brand and consumer behavior application, in order to share a broader vision on this topic and with the aim to implement marketing as a science.

HOW TO BETTER UNDERSTAND ADVERTISING COMMUNICATION BY USING BIOMETRIC MEASURES

Dominika Maison

Three experimental studies will be presented using implicit measures based on facial emotional reactions. Results showed that using neuroscientific measures provide better understanding of reaction toward advertising than only data based on declaration.

CONSUMER BEHAVIOUR IN VIDEO ADS: AROUSAL AS A RECALL TRIGGER

Carlos Flavian
The consumers’ interest on advertising is reducing because they are overexposed to ads. This research aims to understand the mechanism by which the introduction of arousing sequences in video advertising affects brand recall (Br) and ad recall (Ar).

INTEGRATION OF TRADITIONAL AND INNOVATIVE METHODS IN STUDYING ADVERTISEMENTS VIA PAPER, TABLET AND WEBSITE: A NEUROMARKETING EXPERIMENT
Daniela Zambarbieri
Advertising flyers appearing on a single date on a national Italian newspaper are exposed to: 24 subjects via paper, 24 via tablet and 24 via website. The effects in terms of memorization, total eye-fixation time and brain waves activity are presented.

EVALUATING 3 SOCIAL CAMPAIGNS: AN EMPIRICAL STUDY WITH NEUROSCIENTIFIC APPROACH
Maurizio Mauri
We evaluated the effects of 3 social campaign. The 3 ads were exposed to 16 foreigners. During the exposure, for each subjects neuro-psycho-physiological measures were recorded. Results show how they can “detect” the optimal social campaign.

NEW DIRECTIONS FOR CONSUMERS’ SOCIABILITY RESEARCH IN THE VIRTUAL ENVIRONMENT FROM THE NEUROMARKETING PERSPECTIVE. DOES THAT MEAN "BUTTERFLY EFFECT"?
Egle Vaiciukynaitė, Rimantas Gatautis
"A hot medium is one that extends one single sense in "high definition”"
(McLuhan, Lapham, 1994, p. 22)
Consumers’ sociability refers to social interaction between consumers and includes the social presence to which consumers feel connected to others. The proliferation of social technologies has offered new opportunities for consumers to interact with others in the virtual environment. Recently, consumers have been more empowered and active. However, many companies have faced the challenge to manage consumers’ sociability effectively and to measure the performance of it in the virtual environment. Neuromarketing provides better understanding of consumers’ sociability through measuring consumers’ unconscious processes. The study aims to identify new directions for research into consumers’ sociability. Furthermore, the emergence of wearable technology has offered new tools which can be used for consumers’ sociability research. Consumer can wear the technology that includes tracking information related to physiological data. Wearable technology allows researchers to investigate the relationship between consumers’ sociability and environment and captures consumers’ sociability in real time. Thus, this technology will transform research in this area. Several insights for future investigation are identified. Keywords: customers’ sociability, neuromarketing, social technologies, wearable technology
**PS119**

**THE HYBRID APPROACH AND THE SMART ENVIRONMENTS IN SCHOOL: EMPOWERING THE TRADITIONAL PSYCHO-PEDAGOGICAL PRACTICES WITH ECOLOGICAL TECHNOLOGIES**

B03. Development and education - Learning and instruction

Convenor: Orazio Miglino, University of Naples Federico II, Naples - Italy

Presenters: Dario Bacchini, Second University of Naples, Caserta - Italy
Raffaele Di Fuccio, University of Naples Federico II, Naples - Italy
Maria Concetta Miranda, Second University of Naples, Naples - Italy

Discussant: Henrick Lund, Technical University of Denmark, Kongens Lyngby - Denmark

Global investment in Information Communication and Technologies (ICT) to improve teaching and learning in schools have been initiated by many governments; nevertheless the ICT adoption and integration in teaching and learning have been limited (Buabeng-Andoh C., 2012).

At the same time, in the schools are widely widespread well-established psycho-pedagogical approaches (such as the Montessori and Munari experiences, the use of structured materials, etc.) that focus on the active involvement of children and support particular learning materials (educational toys). The ICT devices could easily reinforce these practices, and the materials are able to foster both learning and teaching processes by stimulating the manipulation of concrete objects and peer group cooperation. In addition, they could integrate the new potentialities of the technologies such as the immediate feedbacks, the tracked sessions, and the use of technological daily-life devices in school contexts.

Some technologies, e.g. RFID/NFC sensors, the leap motion and the handwriting recognition are natural candidates to empower the traditional psycho-pedagogical practices. This hybrid approach allows the children and teachers to conduct the activities as in the past, taking advantages of digital technologies. An important aspect is the use of ecological technologies, i.e. not invasive, yet able to extract information by simply observing and not conditioning the children’s activity.

It will be detailed the experience in this field faced by a project named INF@NZIA DIGI.tales 3.6 funded by the Italian Ministry of Education. The project will be shown in a double analysis: from a side will be described the project aims and the results achieved; from another side will be detailed the results of a needs analysis, carrying out a series of focus group and questionnaires in order to understand the belief, perceptions and attitudes of teachers and parents about ICT devices in school for children between 3- to 6-year old.

**INF@NZIA DIGI.TALES 3.6: AN EXPERIENCE OF THE HYBRID APPROACH IN THE ITALIAN SCHOOL CONTEXT**

Raffaele Di Fuccio

It will be described the INF@NZIA DIGI.tales 3.6 project. The aim is to promote the use of ICT technologies (cloud, social media, open data, etc.) and the latest paradigms of human-computer interaction (RFID/NFC sensors and handwriting) in order to define psycho-educational practices which are able to enhance curricular activities.

**TEACHERS’ AND PARENTS’ ATTITUDES AND BELIEFS ABOUT THE USE OF LEARNING TECHNOLOGY IN PRESCHOOLERS**

284
Dario Bacchini
The literature identified several factors that influence the decision to adopt ICT into teaching (Chen, 2008, Clausen, 2007), but considering just the teacher’s perception. The presentation will focus on a study propose to fill this gap exploring, in a Italian sample, perceptions, attitudes and beliefs about ICT in order to understand whether parents and teachers are willing to integrate ew technologies into their practices of teaching.
PS120
BUILDING BRIDGES BETWEEN EUROPEAN UNIVERSITIES AND PSI CHI, THE INTERNATIONAL HONOR SOCIETY IN PSYCHOLOGY

F01. EXPO 2015 Hot Topics - Capacities building and human development

Convenor     Mercedes A. McCormick, Pace University, New York City - United States
Presenters   Bernardo J. Carducci, Indiana University Southeast, New Albany - United States
             John M. Davis, Texas State University, San Marcos - United States
             Mercedes A. McCormick, Pace University, New York City - United States
             Randall Osborne, Texas State University, San Marcos - United States
             Martha S. Zlokovich, Psi Chi, International Honor Society in Psychology, Chattanooga - United States
Discussant   Florence Denmark, Pace University, New York City - United States

This symposium’s main objective is to build bridges, or partnerships, between European Universities (faculty and students) and the USA-based chapters of Psi Chi, the International Honor Society in Psychology. Such bridges will be used to promote capacity building and professional growth/development in the field of psychology. Each speaker’s presentation is focused on providing information and professional experience about promoting Psi Chi’s mission internationally. Psi Chi’s mission is to produce a well-educated, ethical, and socially responsible member committed to contributing to the science and profession of psychology and to society in general, including to recognize and foster the contributions that diversity makes to the science and practice of psychology. The value of international collaboration, student professional development, engagement, and internet-based technologies are significant threads woven through each presentation.

An important outcome of the Building Bridges Symposium is for faculty and students from European universities to understand clearly the historical background of the organization and the important benefits of bringing a chapter of Psi Chi to their campus. The speakers will describe the process for doing so and how it the process has adapted with more international bridges built. A Psi Chi chapter offers professional benefits to the university, psychology department, faculty, and students. Professional benefits of opening a Psi Chi chapter include opportunities to submit for publication in the Psi Chi Journal of Psychological Research, networking, international mentoring, competing for research grants and/or travel grants to attend conferences and other professional meetings, and more. Psi Chi also provides information about graduate school and professional opportunities through technological resources.

Outcomes of the symposium are: 1) to demonstrate a cultural sensitivity model of cooperation between European and US higher education institutions supporting the growth of academic partnerships for faculty and students; 2) describe Psi Chi’s effectiveness at supporting faculty and students’ professional growth; and 3) demonstrate how Psi Chi’s implementation of social media and other technological tools can enhance international collaborations among students in particular.

PSI CHI BUILDING INTERNATIONAL BRIDGES: FROM EUROPE TO AMERICA TO EUROPE

John Davis
This presentation will briefly describe the origin of Psi Chi during the 9th International Congress of Psychology held at Yale University in 1929, ongoing international connections, and recent international initiatives.

**WHAT ARE THE BENEFITS OF INTERNATIONALIZING PSI CHI?**
*Martha S. Zlokovich*
After 80 years as a national honor society, Psi Chi became international in 2009. Presentation considers what does internationalizing the society mean, why is it important to members, and what benefits can it accrue to both US and non-US members?

**BUILDING BRIDGES BETWEEN PSI CHI AND EUROPEAN UNIVERSITIES**
*Mercedes A. McCormick*
This presentation will describe the importance of Psi Chi, the International Honor Society in Psychology connecting with universities represented at ECP to build student engagement, academic success, and leadership skills.

**BUILDING BRIDGES AS DEVELOPMENT: INTERCULTURAL SENSITIVITY**
*Randall Osborne*
This presentation will focus on how Psi Chi’s efforts to build bridges between European universities and our Honor Society represent growth on the 6 stages of Bennett’s developmental model of Intercultural Sensitivity.

**CROSS-CULTURAL CHANCES AND CHALLENGES TO PROMOTING PSI CHI IN ITALY: AN ITALIAN-AMERICAN’S PERSONAL PERSPECTIVE**
*Bernie Carducci*
The nuts and bolts to establish an initial Psi Chi Chapter in Italy will be discussed. Networking outcomes and the cross-cultural values associated with selectivity of college/university honor societies will be emphasized.
To this day, civilized societies have chosen to institutionalize the family as the “standard” eco-container. Today, however the family as an institution is suffering from increasing pressure: external information easily overthrows the values taught at home, and this applies to all domains; from sexuality to religion, from ownership to anarchy, from love to selfish indifference, etc. Furthermore, there is a growing concern in the world as increasing numbers of children and adolescents are having difficulty managing the challenges of development. According to recent sociological research, an increasing number of youth suffer from apathy, sadness, low self-esteem, and seem to be lacking the capacity to define long-term goals and life choices. At the same time, many adolescents struggle with internalizing problems such as anxiety and depression. Interventions that promote positive psychological well-being may equip young people with the necessary life skills, supports and resources to fulfill their potential and overcome adversity. The aim of the symposium is to present a reflection on the educative function with a focus on the state of the art at international level and the question to which the presenters will try to give an answer is “Is it possible to create a professional style for a new social responsibility between traditional culture and globalisation?” Finally, programs aiming at promoting generic psychosocial competence instead of focusing on specific behavioural problems will be highlighted. In particular, programs aimed to facilitate the process by which the individual gains greater awareness, both to her/his advantage, and to that of the ecosystem in question (system and society).

THE EDUCATIVE FUNCTION BETWEEN FAMILY AND SOCIAL RESPONSIBILITY
Marisa Persiani
The paper aims to present a reflection on the educative function, passing through the main psychological currents of thought up to recent well-being psychology, underlining the need for an inter-disciplinary approach.

CRISIS OF IDENTITY, EXISTENTIAL PROBLEM AND SOCIAL CONSCIOUSNESS
Tatiana Vereitinova
Following research by University of Saint Petersburg the principles for a logistic of progress is discussed: 1) increase life quality; 2) emphasis on environment historic values; 3) professional qualifications converge with local environment; 4) international connection point.
AN INNOVATIVE EDUCATIONAL PROGRAMME FOR THE SOCIETY OF THE FUTURE
Rossella Celmi
Educational programmes of the third millennium, based on empowering young people in solving the difficult balance between individual and society from one side, and evolving their inner positive social vocation on the other, are discussed.

AUTHENTIC INDIVIDUAL AND FUNCTIONAL SOCIETY
Daniela Di Pietro
Society is not abstraction, but a system characterised by individuals. Therefore, to succeed in establishing a "healthy" and functional society, it is suggested to improve physical, mental and psychological wellbeing of individual.
PS122

OBJECTIFYING MEDIA: TURNING PEOPLE INTO OBJECTS

C03. Culture and society - Sex and gender

Convenor Anne Maass, University of Padova, Padua - Italy
Presenters Carlotta Cogoni, Scuola Internazionale Superiore di Studi Avanzati, Trieste - Italy
Silvia Galdi, University of Padova, Padua - Italy
Maria Giuseppina Pacilli, University of Perugia, Perugia - Italy
Jeroen Vaes, University of Trento, Rovereto - Italy
Cristina Zogmaister, University of Milan-Bicocca, Milan - Italy
Discussant Mara Cadinu, University of Padova, Padua - Italy

Media (including TV, advertisement, video games) continue to exert a powerful influence on society, shaping social norms and proposing gender-specific role models. In many countries women tend to be objectified, that is portrayed as bodies rather than individuals. Such objectifying portrayals are particularly prevalent in Italian media, where sexualized images are even extended to children. This symposium addresses the influence of such objectifying portrayals of women and girls on both male and female media consumers. It brings together researchers from 5 Italian universities who investigate the effects of objectifying media mainly with experimental methods, combined with reliable and valid measures (see contribution by Zogmaister et al.).

The symposium provides impressive evidence for the robust and pervasive influence of objectification even after relatively short media exposure. Spectators exposed to such media content tend to perceive women (including individual, non-objectified women encountered after the media exposure) as more object-like. Under normal conditions, human beings and objects are processed in distinct brain regions, yet, when objectified, women are processed much like objects (see contribution by Cogoni et al.) and, as a consequence, are perceived as less human (see contribution by Vaes). This object-like perception of women is likely to disrupt normal empathic responses, thereby discouraging bystanders from intervening in help of the victim (see contribution by Galdi). Interestingly, exposure to objectifying media also interferes with cognitive abilities, such as women’s capacity to resolve math problems. Such cognitive impediment is found even in pre-adolescent children (see contribution by Pacilli et al.). Together, this symposium testifies to the multiple effects of media objectification and provides the empirical basis for a broader discussion on how objectifying media shapes society and on how such effects may be prevented.

WHEN WOMEN BECOME OBJECTS
Carlotta Cogoni, Andrea Carnaghi, Giorgia Silani

We investigate the mechanisms of women objectification by using a task where participants had to recognise images of objects and targets (objectified or personalized women, mannequins). Results indicate that objectified women are processed more analytically than the personalized ones or mannequins, comparable to the processing of objects.

TOWARD A RELIABLE AND VALID MEASURE OF AUTOMATIC OBJECTIFICATION
Cristina Zogmaister, Federica Durante, Silvia Mari, Chiara Volpato
The ascription of less-than-human nature to objectified individuals is an important phenomenon and research is needed that links it to its antecedents and consequences. To conduct such research it is mandatory to possess psychometrically sound measures of objectification. Here we review a range of such measures in terms of reliability and validity.

FROM OGLING TO DEHUMANIZATION: UNDERSTANDING SEXUAL OBJECTIFICATION

Jeroen Vaes

Objectification literally refers to perceiving someone as something. When sexually objectified, a woman is treated as a body that is capable of representing her. I will explain the interplay between body-focus and dehumanization, measuring both people’s eye-movements and their tendency to dehumanize male and female targets independently.

EFFECTS OF EXPOSURE TO OBJECTIFYING TV ON OBSERVER’S INTERVENTION IN A SEXUAL HARASSMENT SITUATION

Silvia Galdi

Previous studies have revealed unequivocal evidence of a link between objectifying media and sexual harassment. The present investigation provides an important extension of previous research by demonstrating that exposure to objectifying TV also influences observer’s actual intervention to prevent the harassment incident from progressing.

THE IMPACT OF SEXUALIZED IMAGES ON CHILDREN'S COGNITIVE PERFORMANCE

Maria Giuseppina Pacilli, Carlo Tomasetto, Elisa Fachechi, Chiara Morbidini

We asked primary school children to complete a math performance test after the exposure to sexualized vs. non-sexualized media images of children of similar age. Findings showed that sexualized images hampered participants’ performance. Moreover, a reduction in working memory capacity mediated the effect of sexualized images on children’s math performance.
PS123
SPORT CLINICAL PSYCHOLOGY: A WELFARE INSTRUMENT TO PREVENT DISCOMFORT AND TO CREATE A NEW ENVIRONMENT CULTURE

E10. Health and clinical intervention - Sport and exercise

Convenor Giovanni Lodetti, AIPPS’s (Association International Psychologie et Psychoanalize du Sport) President, SIPCS’s (Società Internazionale Psicologi Clinici dello Sport) President, Milan - Italy

Presenters Alessandra Cova, AIPPS (Association International Psychologie et Psychoanalize du Sport), Milan - Italy
Giovanni Lodetti, AIPPS’s (Association International Psychologie et Psychoanalize du Sport) President, SIPCS’s (Società Internazionale Psicologi Clinici dello Sport) President, Milan - Italy
Gaia Oldani, Social Clinic psychologist, SIPCS (Società Internazionale Psicologi Clinici dello Sport) member, Milan - Italy
Elena Pomesano, Clinical psychologist, SIPCS (Società Internazionale Psicologi Clinici dello Sport) member, Milan - Italy

Over the past twentyfive years in Psychology department led by Marcello Cesa Bianchi have been developed some clinical sport psychology studies thanks to the works of C. Ravasini - G. Lodetti.

These works have created a new area of interest for the applied clinical psychology, which is the clinical Sport Psychology ©, focused on the athletes personality growth and on the prevention and treatment of young age discomfort through sport practice.

The aim of this clinical research is to define and share an universal message of the sport value.

The methodology is clinical observation of defense mechanism and relational and communication ways, read through Transactional Analysis observing defense mechanism used from person into the sport activity, their play activity, their relationship to individuate problems and suggest them the right remedial action. We came to a new sport formula, aimed to the prevention and care discomfort and also to the well being development. These studies have been approved by EFPA European Federation of Psychologist Association. Some workshops have taken place in Milan through the Scuola Regionale dello Sport (CONI) and Ordine degli psicologi della Lombardia; a Master of Science has been activated through the Ospedale Sant’ Anna in Como under the Patronage of Ordine Regionale degli Psicologi e della Provincia di Milano Projects proposed by AIPPS (registered in Ministero delle politiche giovanili e attività sportive) help children and people to develop correct management of aggressiveness, ADHD, hypomotility, good relationships with peers, immigrants integration, disabled integration.

Principal objective is the prevention of disadvantage using sport not in agonistic sense, but like an approach oriented towards the harmonious growth and a god development of the personality. There is also other specific objectives: develop research and build a new generation of educator, sport instructor, parents, athletes, sport manager, volunteers to share a new approach towards welfare, wellbeing, integration. This particular “way of work” permits to reduce welfare costs and is recommended for young country with young people to teach wellbeing.
YESTERDAY, TODAY AND TOMORROW: THE TWENTY-YEARS PATH OF CLINICAL SPORT PSYCHOLOGY AND ITS MANIFESTO
Giovanni Lodetti

Over the past twentyfive years (since 1989) in Psychology department have been developed some clinical sport psychology studies thanks to the works of C. Ravasini - G. Lodetti, Università degli Studi di Milano. These works have created a new area of interest for the applied clinical psychology, which is the clinical Sport Psychology ©, focused on the athletes personality growth and on the prevention and treatment of young age discomfort through sport practice.
Principal objective is the prevention of juvenile disadvantage using sport not in agonistic sense, but like an approach oriented towards the harmonious growth and a god development of the personality. The methodology is clinical observation of defense mechanism and relational and communication ways, read through Transactional Analysis. Our studies observe defense mechanism used from person into the sport activity, their play activity, their relationship to individuate problems and suggest them the right remedial action .These studies have been approved by EFPA that confirmed their complete scientific autonomy in Xth European Congress in 2007, where for the first time a new section called clinical sport psychology has been created and directed by AIPPS (Association International Psychologie et Psycanalyse du Sport).They also develop well being aimed strategies with weak social categories such as children, elderly people and teenagers. AIPPS created the Format Modello Ecologia della Mente e Sport 2012-15 © for EXPO 2015 Milan.

AN ALTERNATIVE TO DRUGS FOR TAKING CARE OF CHILDREN AND TEEN AGERS’ MINOR TO SERIOUS DISEASES THROUGH SPORT AS WELFARE INSTRUMENTS: THE GAME ROOM AND THE INTERVENTION ON CHILDREN’S SERIOUS DISCOMFORT
Alessandra Cova, Elena Pomesano

In order to give a complete answer as an alternative to drugs, there have been created some sport projects for children, aimed to act against young age discomfort like ADHD syndrome and bad management of aggressiveness. The scope of these projects is also to limit the use and the costs of drugs for these children’s families and social communities.Through the creation of sport game rooms in schools and other private structures, it has been possible to define and develop some clinical therapies aimed to limit the symptoms and the disorders through various sports practice. The methodology used in these contexts is the observation of the defense mechanism used during the sport practice and plays. The major results have been obtained from the individual fight sports like fencing. This martial discipline has been used and for and brought good results also in case of conduct disorder and reduced socialization in primary school contexts and in case of Prader Willy Syndrome (PWS) with mental deficit as well. The clinical approach of these projects allowed to develop a real welfare path through sport practice in schools and in other contexts. This represents a way to prevent more serious disease and it also has a strong impact on the social community in terms of costs (drugs) and wellbeing.

BULLISM: SPORT AS SUPPORT AND PREVENTION THERAPY
Gaia Oldani

Nowadays teenagers suffer for minor to major school and non school related diseases. The intermediate level of seriousness is often expressed through transgressive group behaviours and bullism. The lack of capacity to use their cognitive, affective and relational skills as best they can, cause the above mentioned forms of disease. The vicious circle created between the ‘torturer’ (bully) and the ‘victim’ could cause, forward, serious and invalidating diseases for both, like substances abuse and deviance or abandon phenomena or serious depression. These kind of disease are unfortunately growing at international level in primary and secondary schools, where one child on two is at risk of invalidating diseases that could affect the personality development. Sport can act as ‘laboratory’ where young people can test their and their peers’ limits in a protected context defined by rules and aimed to
read the signals of discomfort. This context facilitates the intervention on this discomfort, allowing young people to share and experience a wellbeing path where there are no victims or torturer. This article is about some examples of intervention through sport practice.
Altruistic behavior and motivation are usually characterized by a focus on the welfare of others. Specifically, prosocial behavior is often accompanied by a conflict between the costs to the helper on the one hand and the wish to improve the welfare of others on the other hand. Hence, the promotion of other's welfare may be on the expense of one's own interests. Although altruistic motives are often the basis for prosociality, in many cases prosociality results from more egoistic mechanisms some of which the decision maker may not be fully aware of. The current symposium presents four research projects that highlight some of these egoistic mechanisms. Sverdlik and Nave use terror management theory to suggest that mortality salience influences the importance people attribute to prosocial values such that values that focus on the welfare of close others become more important, while values that focus on the welfare of distant others may become less important, depending on political orientation. Kogut and Harel show that experiencing partial relief from a recent need, such as eating something after being hungry for a few hours, promotes helping similar others, who are experiencing a corresponding need (hunger). However, this experience of partial relief does not promote helping in general. Levontin and Peer argue that guilt may be a strong motivator for prosocial behavior about also that prosocial behavior serves as a guilt relief action that diminish other ethical behaviors such as confessing to one's unethical behavior. Finally, Dickert demonstrates how repeated donation requests are perceived by people as more costly and less beneficial. Taken together, the symposium gives a glimpse to some of the most recent findings in the field of prosocial behavior and motivation. Our Discussant, Daniel Västfjäll, will provide his integrative view of the presentations and facilitate discussion among audience members and contributors.
When people experience an ongoing need, they are less responsive to others’ needs even when those needs match their own state. However, experiencing a relief from a need, promotes the helping of others who are experiencing a corresponding need.

THE “JUST ENOUGH RELIEF” EFFECT: DONATIONS OR CONFESSIONS AS MEANS FOR SELF-EXONERATION FOLLOWING UNETHICAL BEHAVIOR
Liat Levontin, Eyal Peer
In a series of 4 studies we show that the motivation underlying both confessions and pro-social behavior include relieving one’s guilt. Accordingly, one of these strategies (confessing or donating) makes the other one redundant in a given situation.

ALTRUISTIC AND NON-ALTRUISTIC MOTIVATIONS IN REPEATED DONATION DECISIONS
Stephan Dickert
We assessed participants’ donation behavior in a repeated donation task. Results showed that people were less willing to donate to the second donation request and that repeated donations were perceived as more costly and less beneficial.
Graduate programs in Psychology face a period of increased challenges and opportunities to comply with changing external and institutional standards of excellence. Some of the challenges include periodic changes in the standards of voluntary accreditation agencies, licensing board exam content, and psychology board regulations, student demographic changes, student mobility, and internationalization initiatives. Our proposed symposium panel composed of academic experts from Europe and the Americas will present and discuss the internal and external standards of excellence, challenges, and opportunities faced by psychology graduate programs in both regions. Internal and external factors impacting graduate psychology programs include From Europe, Professor Jose Peiró from the University of Valencia will discuss aspects related to standards of excellence, accreditation, quality assurance, and assessment of psychology graduate programs in Europe. Vincent Rogard from the University of Paris Descartes and Marina Romero from the University of Barcelona will add their perspective from experiences in France and Spain. Laura Galarza and Milagros Méndez from the University of Puerto Rico will present on the standards of excellence, accreditation guidelines, and regulatory challenges of psychology programs in the Americas with an emphasis on Puerto Rico, Latin America, and the Caribbean. The presentation by Aida Jimenez will focus on recent developments in psychology accreditation standards for health service psychology doctoral programs in the United States and will discuss general recommendations and implications for psychology graduate programs. Dr. Rodney Lowman from Alliant University in the United States will serve as the symposium discussant. The similarities and differences on standards, challenges, and opportunities between Europe and the Americas will be contrasted.
STANDARDS OF EXCELLENCE, CHALLENGES, AND OPPORTUNITIES OF PSYCHOLOGY GRADUATE PROGRAMS IN THE AMERICAS
Laura Galarza, Milagros Mendez
Presenters will provide an overview and comparison of similarities and differences among countries in the Americas on standards of excellence, accreditation guidelines, regulatory challenges, and assessment practices of psychology graduate programs.

PSYCHOLOGY ACCREDITATION STANDARDS AND PROFESSIONAL COMPETENCY FOCUS FOR PSYCHOLOGY GRADUATE PROGRAMS IN THE UNITED STATES
Aida Jimenez
This presentation will focus on recent developments in psychology accreditation standards for health service psychology doctoral programs in the United States and will discuss general recommendations and implications for psychology graduate programs.

STRENGTHS AND CHALLENGES OF EUROPEAN PSYCHOLOGY GRADUATE EDUCATION: PERSPECTIVES FROM FRANCE
Vincent Rogard
The presentation discusses the standards, strengths, and challenges of psychology graduate programs in France and in multi-country European psychology programs in contrast to the information presented by fellow panelists on Europe and the Americas.

STANDARDS, STRENGTHS AND CHALLENGES OF EUROPEAN PSYCHOLOGY GRADUATE EDUCATION: PERSPECTIVES FROM SPAIN
Marina Romero
The presentation will focus on the standards, strengths, and challenges of psychology graduate programs in Spain and in multi-country European psychology programs in contrast to information presented by fellow panelists on the Americas and Europe.
PS126
YOUNG PEOPLE CITIZENSHIP PROFILES FROM INTERNATIONAL PERSPECTIVE - PART I

F08. EXPO 2015 Hot Topics - Life skills in culture and society

Convenor Anna Maria Zalewska, University of Social Sciences and Humanities, Poznan - Poland
Presenters José Joaquim Costa, University of Coimbra, Coimbra - Portugal
Beata Krzywosz-Rynkiewicz, University of Warmia and Mazury, Olsztyn - Poland
Despina Karakatsani, University of the Peloponnese, Corinth - Greece
Riitta Korhonen, University of Turku, Turku - Finland
Susana Goncalves, Polytechnic Institute of Coimbra, Coimbra - Portugal
Anna Maria Zalewska, University of Social Sciences and Humanities, Poznan - Poland
Discussant Joanna Li Lijuan, Hong Kong Institute of Education, Hong Kong - Hong Kong

The majority of contemporary social problems among youth cannot be effectively solved through political regulation only, but they require active civic skills and engagement. Active participation in social life as citizen is one of the main indicators of the quality of life. Attitudes towards democracy determining citizenship behaviors develop from early adolescence (Hess & Torney, 2005). During the symposium we will discuss the results of a comparative study (supported by CiCeA/ResearchGrant/2014) into young people's citizenship activity profiles. Six types of citizenship activities have been identified based on the Kennedy’s concept (2006): passive, semi-active, politically, socially, personally engaged and change-oriented. 3794 students aged 11-14-18, girls (1955) and boys (1839) from cities (1735) and towns (2031), from 11 European countries where examined with Citizenship Behavior Questionnaire (Zalewska & Krzywosz-Rynkiewicz, 2011). Results show high level of passive, semi-active and personal type of citizenship, very limited engagement in politics and action for legal protesting in all countries. Quick cluster analysis revealed four profiles of young citizens: Activists (with high level of civic engagement in all forms and types of activity, but the highest in politics), Conservatives (with average levels of civic engagement and low level of political engagement), Individualists (with high level of passive and personal engagement and very low political and social engagement) and Alienated (with low levels of all activity types). Different proportion of the profiles were found in particular countries Activists (LV: 42%; ES:16%; PL: 30%; GR:59%; PT: 20%; FI: 36%), Conservatives (LV: 36%; ES: 39%; PL: 37%; GR: 29%; PT: 51%; FI: 2%), Individualists (LV: 4%; ES: 4%; PL: 2%; GR: 5%; PT: 3%; FI: 53%) and Alienated (LV:18%; ES: 41%; PL: 11%; GR: 6%; PT: 26%; FI: 9%).

In the I Part of symposium we will introduce to the problem, research method and will discuss the results from Baltic countries perspective – Estonia and Latvia.

CITIZENSHIP BEHAVIORS AS LIFE SKILLS IN CULTURE AND SOCIETY
Kerry Kennedy

Participation is a key requirement of citizens in democratic societies, both an obligation and a process of engagement. Yet participation takes many forms that can be categorized as passive and active, political and social, legal and illegal. This paper will introduce the broad theoretical framework that has guided the studies reported below.
YOUNG PEOPLE CITIZENSHIP BEHAVIOURS – HOW WE MEASURE THEM
Beata Krzywosz-Rynkiewicz, Anna Maria Zalewska
In the research we used 34-questions Citizenship Behavior Questionnaire with Cronbach Alpha for scales: passive (.80), semi-active (.67), social (.73), political (.72), personal (.63) and changed-oriented (.80) citizenship.

YOUNG CITIZENS PROFILES IN BALTIC COUNTRIES – THE LATVIAN PERSPECTIVE
Mara Vidnere
Results show high level of readiness to protest and low passive and semi-active behaviors. Latvian youth had reflects neutral attitude towards national identity and the desire for to social change.

YOUNG CITIZENS PROFILES IN BALTIC COUNTRIES – THE ESTONIAN PERSPECTIVE
Kristi Kõiv
Estonian youth had focus on two aspects of active citizenships (political and social) rather than semi-active citizenship as voting and an interest in public life.
PS127
YOUNG PEOPLE CITIZENSHIP PROFILES FROM INTERNATIONAL PERSPECTIVE - PART II

F08. EXPO 2015 Hot Topics - Life skills in culture and society

Convenor: Beata Krzywosz-Rynkiewicz, University of Warmia and Mazury, Olsztyn - Poland
Presenters:
Kerry Kennedy, Hong Kong Institute of Education, Hong Kong - Hong Kong
Anna Maria Zalewska, University of Social Sciences and Humanities, Poznan - Poland
Beata Krzywosz-Rynkiewicz, University of Warmia and Mazury, Olsztyn - Poland
Kristi Kõiv, University of Tartu, Tartu - Estonia
Mara Vidnere, Riga Teacher Training and Educational Management Academy, Riga - Latvia
Discussant: Joanna Li Lijuan, Hong Kong Institute of Education, Hong Kong - Hong Kong

The majority of contemporary social problems among youth cannot be effectively solved through political regulation only, but they require active civic skills and engagement. Active participation in social life as citizen is one of the main indicators of the quality of life. Attitudes towards democracy determining citizenship behaviors develop from early adolescence (Hess & Torney, 2005). During the symposium we will discuss the results of a comparative study (supported by CiCeA/ResearchGrant/2014) into young people's citizenship activity profiles. Six types of citizenship activities have been identified based on the Kennedy’s concept (2006): passive, semi-active, politically, socially, personally engaged and change-oriented. 3794 students aged 11-14-18, girls (1955) and boys (1839) from cities (1735) and towns (2031), from 11 European countries where examined with Citizenship Behavior Questionnaire (Zalewska & Krzywosz-Rynkiewicz, 2011).

Results show high level of passive, semi-active and personal type of citizenship, very limited engagement in politics and action for legal protesting in all countries. Quick cluster analysis revealed four profiles of young citizens; Activists (with high level of civic engagement in all forms and types of activity, but the highest in politics), Conservatives (with average levels of civic engagement and low level of political engagement), Individualists (with high level of passive and personal engagement and very low political and social engagement) and Alienated (with low levels of all activity types). Different proportion of the profiles were found in particular countries Activists (LT: 60%; LV: 42%; ES:16%; PL: 30%; GR:59%; PT: 20%; FI: 36%), Conservatives (LT: 27%; LV: 36%; ES: 39%; PL: 37%; GR: 29%; PT: 51%; FI: 2%), Individualists (LT: 5%; LV: 4%; ES: 4%; PL: 2%; GR: 5%; PT: 3%; FI: 53%) and Alienated (LT: 8%; LV:18%; ES: 41%; PL: 11%; GR: 6%; PT: 26%; FI: 9%).

In the II part of symposium research results will be discussed from Central-East European (Poland,), South European (Greece, Portugal) and Scandinavian (Finland) countries. Finally, citizenship behaviors trends, their limitations and perspective for the future will be presented.

YOUNG CITIZENS PROFILES IN CENTRAL-EAST EUROPEAN COUNTRIES – THE POLISH PERSPECTIVE

Beata Krzywosz-Rynkiewicz

Results show high level of social and low political behaviors. Young Poles are focused on personal growth. They are reluctant to rebel and likely to be involved in the affairs of community rather than the matters of the State.
YOUNG CITIZENS PROFILES IN SOUTH EUROPEAN COUNTRIES – THE GREEK PERSPECTIVE
Despina Karakatsani
The Greek youth are focused on passive and social citizenship, less on action for change and personal growth. Results will be analyzed in relation to the historical and sociopolitical background, economic recession and compared to the societal and educational consequences.

YOUNG CITIZENS PROFILES IN SOUTH EUROPEAN COUNTRIES – THE PORTUGUESE PERSPECTIVE
Susana Goncalves, Jose Costa
Results show high level of social engagement and low of readiness for personal growth. Results will be discussed in the light of the economic crisis in Portugal (salaries, unemployment) and the abstention rate in political elections.

YOUNG CITIZENS PROFILES IN SCANDINAVIAN COUNTRIES – THE FINISH PERSPECTIVE
Riitta Korhonen
Results show high level of personal growth activity and loyalty to the state but low social engagement among young Finns.

YOUNG EUROPEAN CITIZENSHIP PROFILES – COMPARISONS, TRENDS, AND LIMITATIONS
Anna Maria Zalewska
Comparisons of data from various countries demonstrate that young people from European nations, that share a similar history and road to democracy, differ in their civic activity profiles. They cannot be joined based on simple parameters such as the period of free market, membership in the former Soviet block or geographic location.
PS128
REHABILITATION OF (TRAUMATIZED) VIOLENT OFFENDERS - CHALLENGES AND NEW DEVELOPMENTS

C11. Culture and society - Forensic psychology and law

Convenor  Tobias Hecker, University of Konstanz, Konstanz - Germany
Presenters  Jérôme Endrass, University of Konstanz, Konstanz - Germany
Tobias Hecker, University of Konstanz, Konstanz - Germany
Anke Köbach, University of Konstanz, Konstanz - Germany
Anselm Crombach, University Lumière of Bujumbura, Bujumbura (Burundi);
University of Konstanz, Konstanz - Germany
Discussant  Andreas Maercker, University of Zurich, Zurich - Switzerland

The rehabilitation of violent offenders remains a challenge in forensic and clinical settings. This symposium will focus on new developments with a particular focus on traumatized offenders. We will first present therapy outcomes of court-ordered therapies for violent and sex offenders. Recidivism rates will be presented for different offense categories and the effectiveness of treatment will be discussed. Then we present with Narrative Exposure Therapy for Forensic Offender Rehabilitation (FORNET) a new approach for treating violent offenders (Elbert, Hermenau, Hecker, Weierstall, & Schauer, 2012). Violent offenders are at high risk of developing trauma-related disorders and appetitive aggression – a hedonic form of aggression (Elbert, Weierstall, & Schauer, 2010), which reduce successful integration into societies (Hermenau, Hecker, Maedl, Schauer, & Elbert, 2013). FORNET aims at reducing both symptoms of traumatic stress as well as aggressive behavior and readiness for aggression. It broadly follows the logic of the evidence-based trauma-focused Narrative Exposure Therapy. The therapist guides the client by means of exposure through his traumatic experiences linking the emotions to the past. In FORNET we encourage to verbalize also positive emotions and experiences that were linked with violent and aggressive behavior. In this way, the whole range of experiences becomes integrated into the autobiographical memory. In FORNET we support the client to foster the role change from a violent offender to a citizen, who lives a socially adjusted life. The client develops visions and wishes for the future to support a successful integration into society. Pilot studies with former soldiers and violent youths proved the feasibility of FORNET and found first evidence of a positive outcome (Crombach & Elbert, 2014; Hermenau, Hecker, Schaal, Maedl, & Elbert, 2013). Here, we present two recent clinical trials providing further evidence for the efficacy of FORNET.

THERAPY OUTCOME IN TREATED VIOLENT AND SEX OFFENDERS
Jérôme Endrass, Astrid Rosseger

All male adult violent and sex offenders (N=200) treated by MHS between 1997 and 2009 were compared to untreated offenders. Recidivism rates will be presented for different offense categories and the effectiveness of treatment will be discussed.

TREATING VIOLENT OFFENDERS BY MEANS OF NARRATIVE EXPOSURE THERAPY
Tobias Hecker, Katharin Hermenau
Using FORNET the therapist helps the client to anchor the whole range of sensory and bodily information, cognitions, and emotions in the past. We highlight the importance of addressing the whole range of experiences while treating violent offenders.

EFFECTIVENESS AND DISSEMINATION OF NARRATIVE EXPOSURE THERAPY FOR FORENSIC OFFENDER REHABILITATION
Anke Köbach, Susanne Schaal, Tobias Hecker, Thomas Elbert
In a clinical trial (N=98) with demobilizing combatants in the eastern DR Congo, where civil war prevailed for decades, we demonstrate that FORNET conducted by trained local counselors reduces trauma-related disorders and fosters reintegration.

ADDRESSING EVERYDAY VIOLENCE IN MALE AND FEMALE EX-COMBATANTS BY MEANS OF FORNET
Anselm Crombach, Corina Nandi, Manassé Bambonyé, Roland Weierstall, Thomas Elbert
Burundi has a history of civil war. Risk factors for violent behavior, e.g. childhood adversities and trauma-related disorders, accumulate in ex-combatants. In a clinical trial FORNET aimed at reducing their involvement in current everyday violence.
Emotions and emotional disorders are strictly interwoven in many clinical models. This symposium explores this connection in some clinical and well-being models. Carmela Sansone examines the developed syllabus which is taught to 4-5 year old children for a school year. There is a pre/post test model utilizing the Social Rating Scale (Gresham & Elliott, 1990); the Clark & Clark Doll Test (1947) and the Empathy Self Report Scale (Eisenberg, 1991). The variables measured have been found to be good indicators of emotional competence and the embracement of diversity and to correlate positively with future success and life satisfaction. Mercedes McCormick shows data testing the efficacy of a stress reducing Mindfulness and Yoga Therapy aimed at building Resiliency in Young Adults dealing with Stressful Cultural Events. Bernardo Carducci and the Studi Cognitivi research team (Francesca Fiore, Giovanni Mansueto, Sara Palmieri, Naomi Aceto, and Roberta Cattani) will show data analysing shyness as a failure to respond appropriately in social situations. Giovanni M. Ruggiero will analyze how emotional disorders depend on negative appraisal of categories of events and relational patterns learned within significant experiences and relationships, which are evaluated as intolerably painful, and grievous; and on rigid and unidimensional management of life themes using inflexibly avoidant, controlling, and/or compensative strategies. Diego Sarracino will speak about the revision, from a neurobiological viewpoint, of the role of emotions in the ABC model as theoretical and technical basis of Rational Emotive Behavior Therapy (REBT).

COGNITIVE BELIEFS AND PROCESS INVOLVED IN SHYNESS
Giovanni Mansueto, Francesca Fiore, Sara Palmieri, Naomi Aceto, Roberta Cattani, Giovanni Maria Ruggiero, Bernardo J. Carducci
Shyness is the failure to appropriately respond to social situations. This study evaluated which irrational beliefs – belonging to rational emotive behaviour therapy, cognitive behavioural therapy and metacognitive therapy models- composed shyness and explored the differences between shyness and social anxiety in terms of beliefs and processes.

MINDFULNESS AND YOGA THERAPY: TOOLS TO BUILD RESILIENCY IN YOUNG ADULTS DEALING WITH STRESSFUL CULTURAL EVENTS.
Mercedes A. McCormick
This presentation will discuss and demonstrate mindfulness and yoga therapy as powerful stress-reducing tools to help adults build resiliency in dealing with serious cultural events. A stress-reducing program using these tools will be provided.
TEACHING EMOTIONAL COMPETENCE AND THE EMBRACEMENT OF DIVERSITY TO PRESCHOOL CHILDREN IN BROOKLYN, NY.

Carmela Sansone

The developed syllabus is taught to 4-5 year old children for a school year. There is a pre/post test model utilizing the Social Rating Scale, the Clark & Clark Doll Test and the Empathy Self Report Scale. These variables have been found to be good indicators of emotional competence, embracement of diversity, future success and life satisfaction.

LIFE THEMES AND PLANS IMPLICATIONS OF BIASED BELIEFS: ELICITATION AND TREATMENT (LIBET)

Giovanni Maria Ruggiero, Gabriele Caselli, Sandra Sassaroli

The LIBET is a model for case conceptualization in which emotional disorders depend on negative appraisal of events and relational patterns learned within significant interpersonal experiences and evaluated as intolerably painful and on rigid management of these life themes using inflexibly avoidant, controlling, and/or compensative strategies.
Many clinical psychologists in the UK are arguing that the time has come to abandon psychiatric diagnosis together with the idea of ‘mental illness’, and instead embrace a consistently psychosocial approach to mental health and distress. It is possible that the next ten years will see a radical paradigm shift in mental health care. The dominance of the medical model over the delivery of mental health care - and therefore the working practices of psychologists - has been such that many psychologists unquestioningly accept approaches to assessment, formulation and therapy based on a conceptual framework that is in many ways incompatible both with psychological science and with the actual practice of psychological therapists. However, until recently, viable alternative frameworks were poorly articulated and not widely disseminated.

This symposium will provide an overview of the critiques and suggested alternatives. It will also outline how we are disseminating these ideas in the UK, the role played by the British Psychological Society Division of Clinical Psychology (DCP) and the widespread welcome which they are receiving. The presenters will give examples from the UK of well-developed alternatives to traditional psychiatric diagnosis (Kinderman), to the design and delivery of mental health services (Pemberton), and to the understanding of problems usually regarded as the preserve of biomedical psychiatry (Cooke). Together, these presentations will outline a coherent alternative to current psychiatric paradigms, and will envision a genuinely – and genuinely practical – psychological perspective.

A PSYCHOLOGICAL MODEL OF MENTAL HEALTH AND WELL-BEING

Peter Kinderman

Psychological science offers robust models of mental health and well-being. These integrate biological findings with the substantial evidence of the social determinants of health and well-being, mediated by psychological processes. This presentation will outline how such approaches offer coherent alternatives to conventional psychiatric paradigms.

THE END OF MENTAL ILLNESS THINKING?

Richard Pemberton

Richard will present the UK Division of Clinical Psychology’s recent groundbreaking Position Statement on psychiatric diagnoses, which calls for a paradigm shift away from a “disease” model.

Peter Kinderman

Psychological science offers robust models of mental health and well-being. These integrate biological findings with the substantial evidence of the social determinants of health and well-being, mediated by psychological processes. This presentation will outline how such approaches offer coherent alternatives to conventional psychiatric paradigms.

Richard Pemberton

Richard will present the UK Division of Clinical Psychology’s recent groundbreaking Position Statement on psychiatric diagnoses, which calls for a paradigm shift away from a “disease” model.
will draw out the implications for theory and practice, and outline a path towards personalized, effective and compassionate psychological care services.

**CHANGING SOCIETY’S WHOLE APPROACH TO PSYCHOSIS**

*Anne Cooke*

Anne will present the DCP’s recent report: “Understanding psychosis and schizophrenia: why people sometimes hear voices, believe things that others find strange, or appear out of touch with reality, and what can help”. This widely acclaimed report takes a consistently psychological approach to what is often seen as quintessential “mental illness”.

SEARCHING FOR NEW APPROACHES TO ENGAGE INTERGROUP TENSIONS IN CONTEMPORARY COMPLEX SOCIETIES: INSIGHTS FROM RESEARCH IN ISRAEL AND POLAND

C05. Culture and society - Group processes and intergroup relations

Convenor Helena Desivilya Syna, The Max Stern Yezreel Valley College, Emek Yizrael - Israel
Presenters Daniella Arieli, The Max Stern Yezreel Valley College, Emek Yizrael - Israel
Michał Bilewicz, University of Warsaw, Warsaw - Poland
Victor Friedman, The Max Stern Yezreel Valley College, Emek Yizrael - Israel
Michal Raz, The Max Stern Yezreel Valley College, Emek Yizrael - Israel
Discussant Michał Bilewicz, University of Warsaw, Warsaw - Poland

Mounting social divisions and growing diversities characterizing the contemporary societies call for new approaches of engaging the emerging complex intergroup relations. Such novel perspectives and methods need to deal with intergroup tensions in a constructive manner: allowing meaningful existence for all the groups, both autonomously and in tandem while avoiding ostracism, exclusion and promoting expression of genuine voices. Kristeva (1991) succinctly highlighted this challenge: "The question is again before us today as we confront an economic and political integration on the scale of the planet: shall we be, intimately and subjectively, able to live with the others, to live as others, without ostracism but also without leveling?"(p.1).

The symposium aims to discuss lessons emerging from research in two complex societies: Israeli and Polish both abound with conflict-ridden histories of intergroup relations. Drawing on social psychology of intergroup relations, conflict engagement theories and dynamic complex systems, the new approaches explored in the studies focus on identifying ways to circumvent the core division and conflict issue while creating alternatives to maintain cooperative intergroup relations (e.g. alternative attractors, superordinate goals, joint spaces and crossed categories). Such alternatives include common geographic identity (community), common tasks for mixed work teams, common goals such as professional education and partnerships pursuing new social or business venture. The Israeli presentations focus on examination of such novel methods in the area of nursing education and mixed nurses team in actual work setting and the Polish revolves around the well-know "contact hypothesis" and its expansion to include historical elements. Notwithstanding differences in context and research methodologies, the symposium will culminate with integrated insights and delineation of future research directions.

INTERVENTION PROCESSES AT AN ARAB-JEWISH ENCOUNTER IN THE ACADEMIA
Daniella Arieli, Victor Friedman
The study aims to both understand as well as influence Jewish and Arab nursing students’ relations. We suggest a novel theoretical-practical approach based on social constructivism, for coping with tensions related to intercultural encounters. It encourages the participants to consciously and jointly reflect on and construct their space of encounter.

MAPPING THE STRENGTHS AND CHALLENGES IN JOINT ENCOUNTERS OF NURSES IN ETHNICALLY AND NATIONALLY DIVERSE WORK TEAMS

309
Michal Raz, Helena Desivilya Syna
The study examines nurses’, members of mixed work teams, efficacy in developing cooperative relations to accomplish joint tasks, utilizing the positive aspects of diversity while sidestepping negative legacies of protracted national conflict. It also elucidates the fostering and inhibiting factors in constructing cooperative relations.

HOW HISTORICAL CONTACT CAN AFFECT INTERGROUP RELATIONS?
Michał Bilewicz
In this talk I try to extend Allport’s contact hypothesis (1954) into historical dimension. I suggest that knowledge about historical contacts of our ancestors, as well as about group members who transgressed group borders by their moral behavior (moral exemplars) can improve intergroup relations. Evidence from Polish-Ukrainian, Polish-German and Polish-Jewish context will be provided.
Entrepreneurship leads to both economic growth and job creation, at the same time delivering innovative solutions to social and environmental problems. Small and medium-sized enterprises not only constitute more than 90 per cent of European businesses, but also provide the majority of private employment in Europe. Most of the entrepreneurship literature is dominated by business administration and economics, however psychologists make important contributions to the understanding of entrepreneurial intentions, cognitive processes, of entrepreneurial activities and their interplay with broader social environment. As the unique working environment, entrepreneurial firms offer a chance to investigate psychological mechanisms of motivation, cognition, personality, and performance of entrepreneurs and their employees. Therefore, the symposium proposes to investigate entrepreneurship from a psychological perspective, including variables on individual and team levels. Presentations included in the symposium explore the relationships between personal resources, risk-taking propensity, motivation and entrepreneurial intentions, actions, or business success. They aim to show connections between psychological research and entrepreneurship by presenting novel empirical findings which examine psychological antecedents, outcomes and processes associated with entrepreneurship, including social context into the analyses.

The Social Perception of the Entrepreneur and Its Effects on Entrepreneurial Attitudes, Intention and Support

Garazi Azanza, Leire Gartzia

Despite the importance of entrepreneurship for economic growth and development, research about the social perception of the entrepreneur is still scarce. This study aims to further explore the social image of the entrepreneur in key groups: young Spanish people and social agents involved in the business creation process.

Entrepreneurs Are Not Risk Prone, They Are Brave

Artur Domurat

The aim of the studies is to test the common belief that risk-taking propensity is the distinguishing trait of entrepreneurs. As it turns out, entrepreneurs do not consider themselves as prone to risk, but as brave. Their choices in lottery tasks are not riskier than choices of wage earners. Differences emerge when the settings are ambiguous.
THE ENTREPRENEURIAL POTENTIAL AT THE TEAM LEVEL: A PROXY FOR A LONGITUDINAL APPROACH
Susana Correia Santos, António Caetano, Silvia Fernandes Costa
This study presents the entrepreneurial potential construct in entrepreneurial teams competing in a venture competition. A total of 18 entrepreneurial teams participated in this study. The results showed that entrepreneurial potential profile can be a useful tool to point out successful and highly potential teams.

SELF-EFFICACY, POSITIVE AFFECT, AND ENTREPRENEURIAL SUCCESS: LONGITUDINAL RELATIONS
Adam Żaliński, Wiktor Razmus, Mariola Laguna, Oleg Gorbaniuk
The research aims to reveal reciprocal relationships between positive psychological resources and success in entrepreneurial activity, using longitudinal framework. It tests how work specific self-efficacy, positive affect represented by enthusiasm, and subjective entrepreneurial success reciprocally influence one another in a three-wave study.
EIS133
BECAUSE THE WAY TO THE HEART IS THROUGH THE STOMACH.
PSYCHOLOGICAL PREVENTION AND INTERVENTION OF EATING DISORDERS

F05. EXPO 2015 Hot Topics - Eating disorders

Convenor: Christoph Steinebach, Zurich University of Applied Sciences, Zurich - Swiss
Presenters: Christoph Steinebach, Zurich University of Applied Sciences, Zurich - Swiss
Anne-Christine Volkart, Institute Private practice, Orbe - Swiss
Karin Teepe, Centre de Soins Parcours d’Exil, Paris - France
Volker Schulte, Institute University of Applied Sciences Northwestern Switzerland FHNW, Windisch - Swiss
Alberto Zucconi, IACP Institute Instituto Dell’Approccio Centro Sulla Persona, Roma - Italy

Discussant: Alberto Zucconi, IACP Institute Instituto Dell’Approccio Centro Sulla Persona, Roma - Italy

Social conditions, cultural norms, and individual needs determine our eating habits. Eating disorders lead to severe impairments that lead not only to individual but also social, and societal harm. Prevention and therapeutic services are aimed at changing the individual behavior and to forge a lasting influence on problematic emotions, cognitions and social factors. It is becoming increasingly clear that a consideration of the basic needs of the individual, their strengths, and resources must complement the traditionally on deficits oriented interventions. In this symposium we offer an analysis of current eating disorders as a social as well as individual problem. We reflect on strategies of health promotion and psychotherapy in different countries. To line out new perspectives for both, health promotion and therapy we stress the perspective of basic needs and strengths. As the participants of the symposium are from practice as well as research both perspectives will be brought together to highlight evidence based practice and practice based theory in this problem area.

BODY AND MIND: BUILDING RESILIENCE IN PSYCHOTHERAPY FOR CHILDREN AND YOUTH
Christoph Steinebach
Current innovations in psychotherapy for children and youth strengthen the importance of basic needs, strengths, and resilience as object and purpose. Commonalities of theory based interventions to main concepts of positive psychology are outlined. Consequences for eating disorder therapies are discussed.

FOOD AND NUTRITION BETWEEN BASIC NEEDS AND LACK OF SOCIAL RELATIONSHIPS: THE SITUATION OF THE REFUGEES
Karin Teepe
Eating disorders concern most asylum seekers and come as silent symptoms within severe psychological suffering, frequently chronicised by the length and the difficulties of the immigration procedure. Social constraints urge the patient to consider food merely as achievement of a basic need. Therapy issues are discussed.
EATING DISORDERS AND OBESITY. EXPERIENCES WITH PSYCHOLOGICAL PSYCHOTHERAPY IN A PSYCHIATRIC INSTITUTION

Anne-Christine Volkart

The changes of our relationship to food and nutrition over the last decades goes together with changes in the care of people suffering from eating disorders and obesity. I want to discuss it on the background of a 10 years experience in a psychiatric institution in Switzerland, treating people suffering from eating disorders and obesity.

HEALTHY BODY IMAGE POLICIES

Volker Schulte

Media and fashion industry nowadays often provide ideal images of body appearance which do not cover reality. Never was the pressure on young people as strong as today to appear "physically perfect". Teens who can no longer perform their natural body undermine their self-esteem. Switzerland launched a multi-factorial body image campaign which fosters a healthy body image beyond fashion beauty standards.

EMPOWERMENT AND ADVOCACY. THE CASE OF EATING DISORDERS

Alberto Zucconi

Health promotion is an empowerment approach to strengthen health resources which enable individuals and groups to enjoy a lifestyle related to health and well-being. Especially in the case of eating disorders health promotion and prevention require a clear orientation framework. Advocacy for health means to set priorities, to coordinate health related initiatives and to clarify the division of tasks between national and regional levels.

</tbody>
</table>

The Importance of prevention of ill-health and promotion of wellbeing needs to be high on the agenda of governments and health systems. Rechel (2014) make the point that a very low proportion of health spending is on prevention. Psychologists have a key role to play in this field and this symposium will provide an overview of the work of the newly formed EFPA Board of prevention and intervention (http://preventionintervention.efpa.eu/introduction/).

The symposium presents areas of work with children and young people: one of an intervention at an institutional level in orphanages; another study on the use of EMDR and the framework of Adverse childhood experiences (http://www.cdc.gov/violenceprevention/acestudy/); and on suicide prevention among young people in Europe.

We will close the symposium with a presentation of the results of a survey across member associations concerning the work that is done in prevention.

**THE WORK OF THE EFPA BOARD OF PREVENTION AND INTERVENTION**

*Tony Wainwright*

Over the past two years the EFPA Board of prevention and intervention has been working to develop a framework for collaborative working to promote this area of psychological practice. The presentation will outline the main focus of the group’s work, the goals it has set and the obstacles to their achievement. It will also invite participants to join with the group’s work in developing a European network of applied psychologists working in prevention.

**PREVENTION OF THE SOCIAL ORPHANHOOD: ST. PETERSBURG BABY HOME INTERVENTION PROJECT RESULTS AND NEW POLICY ON INSTITUTIONS FOR CHILDREN LEFT WITHOUT PARENTAL CARE**

*Rifkat J. Muhamedrahimov*

This presentation is focused to describe the quasi-experimental institutional intervention project designed to support caregiver-child interactions and relationships in three institutions for children birth to 4 years, called Baby Homes, in St. Petersburg, RF. The results of the project influenced the new resolution of the RF Government concerning institutional care, ultimately requirements for creating in institutions a family environment for orphan children.
ADVERSE CHILDHOOD EXPERIENCES AND THE ROLE OF EMDR THERAPY IN PREVENTION AND INTERVENTION
Isabel Fernandez, Chiara Callerame
The attention of scientific research in recent years has been focused on the link between a history of traumatic life events and the onset of psychological and medical disease in adulthood. The aim of the presentation is to explain the concept of Adverse childhood experiences (ACE) and to explore its usefulness in planning prevention and the role of EMDR therapy as one of the intervention programs.

SUICIDE PREVENTION IN YOUNG PEOPLE
Vita Poštuvan
Suicide prevention is as complex as the phenomenon of suicide. Targeting young people we aim to influence their developmental processes in order to increase their well-being and prevent suicide not only in this developmental phase, but also later in life. Interventions include awareness programmes, education of gatekeepers, screening, as well as changes of attitudes in society.

PREVENTION AND INTERVENTION IN EUROPEAN COUNTRIES: RESULTS OF A SURVEY
Britt Randi Hjartnes Schjodt
This presentation aims to give a brief overview of gathered information concerning member associations and their involvement with this branch of practice. The data comes from answers to an informal questionnaire: What are the main challenges when it comes to mental health and quality of life issues in some European countries, and what can be done to prevent and intervene at different levels. This presentation is supplemented by data from World Health Organisation and organisation for economic Co-operation and Development overviews. It will be discussed in terms of what kind of skills and competence psychologists need to build, in order to participate in evidence-based prevention and intervention at a community level.
EIS135
HUMAN RIGHTS, PROFESSIONAL AND ETHICAL RESPONSIBILITIES OF PSYCHOLOGISTS, SYMPOSIUM A

C01. Culture and society - Ethics and deontology
C08. Culture and society - Prejudice and social exclusion

Convenor  Polli Hagenaars, EFPA Task Force on Human Rights - Netherlands
Presenters  Artemis Giotsa, University of Ioannina, Ioannina - Greece
            Peter Kinderman, University of Liverpool, Liverpool - United Kingdom
            Kerstin Söderström, Lillehammer University College, Lillehammer - Norway
            Polli Hagenaars, EFPA Task Force on Human Rights - Netherlands
Discussant  Ulrich Wagner, Philipp University of Marburg, Marburg – Germany

EFPA wants to articulate more strongly the responsibilities of psychologists and to develop policies for counteracting human rights violations. Therefore, a Task Force Human rights has been established. Human rights are documented in the universal declaration of Human rights and the convention on the rights of the child, ratified by national states. Responsibilities of psychologists for the promotion of Human rights and counteracting violations of Human rights derive from their expertise and role in society as reflected in their Codes of ethics. This symposium distinguishes responsibilities of psychologists for their clients and for the society at large and scope for action by individual psychologists as well by national and international associations of psychologists.

The Task Force intends to develop a policy that will enable action to be taken based on the unique expertise and competence of psychologists. This policy is meant to raise awareness of Human rights and (risks of) Human rights violations, to prevent Human rights violations, to promote Human rights, and to alleviate the effects of Human rights violations.

The focus of the first part of this double symposium is on the ethical and professional responsibilities of psychologists for the protection and promotion of Human rights, especially in the light of the EFPA Meta Code. The core question to be discussed is: what can and what should professional psychologists do as individuals, as well as what can and what should EFPA Member associations do about promoting Human rights.

The second part of the symposium will underscore the need for education in Human rights. The assumption is that Human rights should be part of university education and professional training, including continued professional development. This symposium aims to contribute to the development of curricula and ways to transfer knowledge and experience.

HUMAN RIGHTS IN EUROPE (GREECE)
Artemis Giotsa
This present paper describes the protection of Human rights in Greece. The country is a signatory to the European convention on Human rights, the Geneva convention relating to the Status of Refugees and the United Nations convention against Torture. Many problems arise in different fields in Greece: the treatment of migrants, refugees and Roma families, conditions in prisons, along with many other topics.

EMBEDDING HUMAN RIGHTS INTO THE PROFESSIONAL DUTIES OF PSYCHOLOGISTS
Peter Kinderman
Applied psychologists are confronted with human rights challenges, and are subject to several sets of expectations; from professional bodies, regulators, legislators and external pressure groups. This presentation will discuss the UK experience of embedding human rights responsibilities into psychologists' statutory standards of proficiency.

**HOW CAN PSYCHOLOGICAL KNOWLEDGE AND FORMAL PROCEDURES CONTRIBUTE TO STRENGTHEN CHILDREN’S RIGHTS?**

*Kerstin Söderström*

The right of the child to have his or her best interests taken as a primary consideration is vague and often put aside when in conflict with other interests or principles. This presentation discusses how children’s rights and best interests can be strengthened by psychological knowledge and procedures of best-interest assessments and determinations.

**HUMAN RIGHTS, AN IMPLICATION FOR PROFESSIONAL EDUCATION FOR PSYCHOLOGISTS**

*Polli Hagenaars*

As Human rights are a responsibility of psychologists, this should have implications for their education and training. This societal responsibility has to be ‘translated’ into knowledge and practice for psychologists. As Human rights have been formulated predominantly in judicial and political terms, a societal perspective on Human rights needs to be further elaborated.
EIS136
HUMAN RIGHTS, PROFESSIONAL AND ETHICAL RESPONSIBILITIES OF PSYCHOLOGISTS
SYMPOSIUM B: PROFESSIONAL EDUCATION FOR PSYCHOLOGISTS

C01. Culture and society - Ethics and deontology
C08. Culture and society - Prejudice and social exclusion

Convenor Polli Hagenaars, EFPA Task Force on Human Rights -

Presenters Ioannis N. Dimitrakopoulos, European Union Agency for Fundamental Rights, Vienna - Austria
Janel Gauthier, Laval University, Quebec City - Canada
Nora Sveaas, University of Oslo, Oslo - Norway
Ava Thompson, College of The Bahamas, Nassau - Bahamas

Discussant Ulrich Wagner, Philipp University of Marburg, Marburg – Germany

EFPA wants to articulate more strongly the responsibilities of psychologists and to develop policies for counteracting human rights violations. Therefore, a Task Force Human rights has been established. Human rights are documented in the universal declaration of Human rights and the convention on the rights of the child, ratified by national states. Responsibilities of psychologists for the promotion of Human rights and counteracting violations of Human rights derive from their expertise and role in society as reflected in their Codes of ethics. This symposium distinguishes responsibilities of psychologists for their clients and for the society at large and scope for action by individual psychologists as well by national and international associations of psychologists. The Task Force intends to develop a policy that will enable action to be taken based on the unique expertise and competence of psychologists. This policy is meant to raise awareness of Human rights and (risks of) Human rights violations, to prevent Human rights violations, to promote Human rights, and to alleviate the effects of Human rights violations.

The focus of the second part of the symposium underscores the need for education for psychologists in Human rights. The assumption is that Human rights should be part of university education and professional training, including continued professional development. This symposium aims to contribute to the development of curricula and ways to transfer knowledge and experience.

THE CONTRIBUTION OF PSYCHOLOGISTS IN PROMOTING HUMAN RIGHTS IN THE EUROPEAN UNION THROUGH THEIR WORK
Ioannis N. Dimitrakopoulos

Human rights treaties set out obligations for governments. Psychologists through counseling and therapeutic practices contribute to the fulfillment of these rights, e.g. When providing care and therapy to crime victims; when they facilitate dialogue between ethnic or religious communities. This session will discuss how this work can be framed in a Human rights perspective.

THE EVOLUTION OF DOCUMENTS ASSERTING HUMAN RIGHTS: IMPLICATIONS FOR HUMAN RIGHTS PROMOTION AND EDUCATION
Janel Gauthier

There is a movement in psychology to develop policies that articulate the ethical responsibilities of
psychologists for promoting Human rights (HR) and counteracting HR violations. In this presentation, I examine the historical development and the contemporary meaning of HR and I discuss the implications of my findings for HR promotion and education in psychology.

PSYCHOLOGISTS, HUMAN RIGHTS AND ETHICS - SOCIETAL RESPONSIBILITIES OF PSYCHOLOGISTS

Nora Sveaas

Ensuring that human rights are respected and that all individuals are protected from abuse or violations represent important challenges in all societies. Psychologists have responsibilities related to this. Participation in monitoring bodies and contributions to reporting and implementation of recommendations, as well as the need for human rights education for psychologists will be highlighted.

CHILDREN’S RIGHTS AND PSYCHOLOGY EDUCATION AND TRAINING: ADVANCING CHILDREN’S WELL-BEING IN THE GLOBAL COMMUNITY

Ava Thompson

The CRC has transformed child welfare legislation and policy development in the global community but there is limited evidence of its integration into psychology education and training (PET). In this paper I present a Bahamian model for teaching children’s rights as a social value system and discuss the implications for advancing psychology’s engagement in promoting children’s rights and well-being.
EIS137
‘ETHICAL ASPECTS OF PSYCHOSOCIAL SUPPORT IN CRISIS AND DISASTERS, LESSONS LEARNED FROM THE DIFFERENT EUROPEAN COUNTRIES’

F07. EXPO 2015 Hot Topics - Psychological consequences of disasters for individuals, families and communities

Convenor "Magda Rooze, National Association of Psychology the Netherlands, Diemen - Netherlands"

Presenters
Maria Filippova, Centre of Emergency Psychological Aid of EMERCOM of Russia, Moscow - Russian Federation
Anders Korsgaard Christensen, Copenhagen University Hospital, Copenhagen - Denmark
Eva Muenker Kramer, Association of the Austrian Psychological Association; EMDR Institute Austria, Krems/Donau - Austria
Magda Rooze, Arq Psychotrauma Expert Group, Diemen - Netherlands
Salli Saari, University of Helsinki, Helsinki - Finland

Discussant Magda Rooze, National Association of Psychology the Netherlands, Diemen – Netherlands

Adequate psychosocial intervention following disasters can reduce ill health and foster resilience if handled appropriately. The standing committee on crisis and disaster Psychology of the European federation of psychologists associations (EFPA) wants the citizens of Europe to have access to comparable psychosocial services regardless of where they live. By a more systematic focus on psychosocial support within each member State’s emergency planning, by proper training of volunteers and professionals, and by describing a minimum level of care for those who experience disasters.

The rapid development in the field of disaster, crisis and trauma psychology has continued. Disasters such as bus accidents, airplane crashes, mining accidents, large entertainment event disasters, natural disasters such as earthquakes and floods, terror events such as bombings and school shootings have posed great challenges for disaster and crisis psychology. In conjunction with this state of affairs, the development of guidelines for the delivery of psychosocial support, standards of training for disaster and crisis psychologists and the organization of disaster, trauma and crisis psychologists in each country have gained momentum. To join forces the SC thinks it is of great importance that the European countries learn from each other’s experiences and expertise. This sharing of lessons learned and knowledge is the heart of the work of the SC.

Crisis and disaster psychology is slightly different from other psychological tasks in three aspects: the work is often carried out on the crisis/disaster scene, there is often great media coverage and the affected persons are in a special vulnerable situation, because they are shocked and threatened by what has occurred to them.

The SC members reflected on how these special conditions may influence ethical issues and wants to discuss this to develop specific guidelines on ethical aspects in the work of crisis and disaster psychologists.

ETHICAL ASPECTS OF RENDERING AN EMERGENCY PSYCHOLOGICAL AID IN EMERGENCIES TO REPRESENTATIVES OF DIFFERENT CULTURES
Maria Filippova
The personal experience of the authors dealing with the victims in emergency situations in Russia and abroad shows both culture non-specific and culture-specific acute stress responses. The forms and methods of responding demonstrated are of practically all cultures in the emergency situations are attributed to culture non-specific responses.

DISASTER PSYCHOLOGY: ETHICS IN CLINICAL WORK AND RESEARCH
Anders Korsgaard Christensen
What ethical standards are important to be aware of in the acute phase after disasters and major accidents. Who needs the help the most and why? How can research results in the field of traumatic stress be utilized in the best way to benefit the victims. Ethical aspects of research design in post traumatic stress studies will also be discussed.

PROFESSIONAL DISCRETION IN DISASTER AND CRISIS PSYCHOLOGY AND ITS NEED TO NETWORK – AN UNSOLVABLE DILEMMA OR A CHALLENGE
Eva Muenker Kramer
In many countries psychologists have a very strict law on professional discretion. In psychological first aid and in mid term disaster and crisis psychology networking is essential also and especially in the interest of the concerned persons. In the presentation arguments, pro’s and con’s between law and practical reality will be discussed.

TERRA THE ‘STAIRCASE TO TERRORISM’ – RADICALISATION IN EUROPE AND HOW TO INTERVENE
Magda Rooze
The TERRA research provides information about psychosocial factors which play a role in the radicalisation process. This can be used to positively impact upon supporting prevention and the de-radicalisation process, through people who come into daily professional contact with vulnerable individuals and groups. But on what grounds do we intervene.

RESEARCH RESULTS VERSUS CLINICAL EXPERIENCES – HOW ORGANIZE ETHICAL PSYCHOLOGICAL CRISIS HELP
Salli Saari
In acute crisis work research results and clinical experiences lead to different conclusions. Research results indicate that most people who have been exposed to a traumatic event recover without crisis help, but is it ethical to leave them alone with their difficult experience, when we are thinking of the needs of the victims.
EIS138
THE PSYCHOLOGIST IN SPORT AND EXERCISE

E10. Health and clinical intervention - Sport and exercise

Convenor
Michel Nicolas, University of Burgundy, Dijone - France

Presenters
Michel Nicolas, University of Burgundy, Dijone - France
Ross Hall, University of South Wales, Cardiff - United Kingdom
Zrinka Greblo, University of Zagreb, Zagreb - Croatia
Irina Simonenkov, Russian State University of Physical Education, Sport, Youth and Tourism (SCOLIPE), Moscow - Russian Federation
Pedro Almedia, ISPA University Institute, Lisbon - Portugal
Claire-Marie Roberts, University of Worcester, Worcester - United Kingdom
Enrique Cantón, University of Valencia, Valencia; ISPA University Institute, Lisbon (Portugal) – Spain

Professional practices and interventions of psychologists in sport and exercise have greatly increased the last decade. However, despite the importance of psychological factors both in performance and well-being, psychologists’ interventions are still unknown. This symposium proposes practices and interventions of psychologists in sport and exercise but also in constraining and extreme situations.

AFFECTIVE, SOCIAL AND COGNITIVE OUTCOMES DURING A ONE YEAR WINTERING IN CONCORDIA
Michel NICOLAS

This study investigated time patterns and the relationships between perceived stress, recovery, control, attention lapses and defense mechanisms during a 12-month wintering in Concordia polar station with an international crew. Preventive psychological countermeasures should be developed to improve adaptation to ICE (Isolated, confined, Extreme) situations such as polar stations or space missions.

ELITE RIFLE SHOOTERS AND EMOTIONAL CONTROL: PREPARATIONS FOR THE 2014 COMMONWEALTH GAMES
Ross HALL

Biofeedback is a therapeutic technique used to promote health and improve performance. This study outlines an intervention with elite shooters in preparation for the 2014 Commonwealth Games. Individually preferred breathing frequency rates can lead to increases in heart rate variability, which is suggested to be linked with greater emotional control. The impact of such training upon shooting performance is discussed in line with research evidence.

RELATIONSHIP BETWEEN PHYSICAL ACTIVITY AND MENTAL HEALTH AMONG HIGH-SCHOOL STUDENTS
Zrinka GREBLO, Maroje SORIĆ, Marjeta MIŠIGOJ-DURAKOVIĆ

Empirical findings suggest that physical activity has beneficial effects across several mental-health outcomes. However, studies aimed to determine the relationship between physical activity and psychological well-being among adolescents are still scarce. Thus, the aim of our study was to further contribute to this specific area of knowledge.
TEST OF PERFORMANCE STRATEGIES ADAPTATION FOR EVALUATION OF PSYCHOLOGICAL SKILLS
Irina Simonenkova
The basic psychological skills are Imagery skills, psychic energy management skills, stress management skills, attentional skills, and goal-setting skills. The TOPS (Test of Performance strategies) was developed to provide a test of psychological skills used both in competitions and practice. The purpose of this study is adaptation TOPS questionnaire, developed by Murphy and Hardly in 1999, into Russian language.

ENHANCING ADOLESCENT SPORTS PERFORMANCE THROUGH PARENTAL EDUCATION INTERVENTIONS
Claire-Marie Roberts
Parents of adolescent athletes play a critical role in their sporting development. This support can be the difference between the athletes' progression or dropout, yet parents are rarely informed of how their behaviour can bring about a positive influence. This study involved educating the parents of elite adolescent athletes on how best to support the sporting development of their children. The impact of the intervention was examined through coach and athlete feedback.

THE INTERCONTINENTAL SPORT PSYCHOLOGY: EUROPE AND LATIN AMERICA IN THE INTERNATIONAL PERSPECTIVE
Enrique CANTÓN, Pedro ALMEDIA
A professional specialty needs that his profile of competences and the formation to develop, they are clear and differentiated from any other specialties. This subject is defined by his area of action and the concrete characteristics of the work. In this sense, it seems logical that therefore it is common in any part of the world, at least in very substantial aspects. In this work, we contribute some elements to analyze the current situation, especially in Europe and America, and to aim at some challenges of future in this aspect.
EIS139
TEACHING ETHICS

C01. Culture and society - Ethics and deontology

Convenor     Pierre Nederlandt, Galerie Agora, Bruxelles - Belgium
Presenters   Pierre Nederlandt, Galerie Agora, Bruxelles - Belgium
Presenters   Kathryn Bullen, Aberystwyth University, Aberystwyth - United Kingdom
Presenters   Artemis Giotsa, University of Ioannina, Ioannina - Greece
Presenters   Alla Shabolts, Universitetskaya, Saint Petersburg - Russian Federation

Teaching ethics for psychologists seems obvious but how should it happen? The first step is to inform the students but afterwards it's also very important to give information to the working psychologists and also to answer their questions concerning the ethical dilemmas in the practice. The panel presents the questions concerning teaching ethics and gives some concrete examples of the situation in some European countries.

TEACHING ETHICS: WHEN, HOW? THE GUIDELINES FROM EFPA
Pierre Nederlandt

There are a lot of questions concerning teaching ethics. The first is “when?” During the studies of course but also during the professional life. A second question is “how?” Is it obvious to organize a special course during the studies or must the deontology be explained by a lot of teachers? And what are the topics to be presented: the national code, the Model code from EFPA, the specific codes for some specialists? And who has to teach ethics? Psychologists, lawyers? This presentation opens the discussion.

DEVELOPING ETHICAL COMPETENCES IN PSYCHOLOGY TEACHING AND PROFESSIONAL TRAINING IN THE UNITED KINGDOM
Kathryn Bullen

In the UK, teaching Psychology frequently starts at pre-tertiary level. Continued professional development (CPD) is a requirement for UK based psychologists. Regardless of the level of training all individuals engaged in research in psychology are expected to be familiar and compliant with the British psychological society Codes of Research ethics. Codes of professional practice also apply to practitioners in all areas of applied psychology. To date, the main emphasis at the pre-professional level has been on the ethics of research. However, there is an acknowledgement within UK psychology that there is a need to develop ethical awareness and sensitivity across all levels of psychology teaching. The principles underpinning the guidance are outlined in this presentation together with initial feedback from users of the guidance regarding its utility and practical benefits in the learning environment.

THE CODE OF ETHICS AND TEACHING ETHICS IN GREECE
Artemis Giotsa

This presentation includes the history of the development of the code of ethics in Greece and how this code is presented to the students. It also develops the questions concerning the limits of an academic presentation of ethics.

THE BARRIER FOR TEACHING ETHICS FOR PSYCHOLOGISTS IN COUNTRIES WHERE THIS KIND OF COURSES ARE RELATIVELY NEW
Alla Shabolts
The proposition is to share the Russian experience of teaching ethics and to discuss the barrier for teaching ethics for psychologists in countries where this kind of courses are relatively new and where an important question is to share challenges with others.
WHAT CAN PSYCHOLOGY CONTRIBUTE TO THE DEFENCE AND PROMOTION OF HUMAN RIGHTS?

Convenor: Saths Cooper, International Union of Psychological Science and Pan-African Psychology Union, Johannesburg - South Africa

Presenters: David Fryer, Australian College of Applied Psychology, Brisbane - Australia
Pamela Maras, University of Greenwich, Greenwich - United Kingdom
Robert A. Roe, President of EFPA, Maastricht - Netherlands
Nora Sveaas, University of Oslo, Oslo - Norway
Ava Thompson, College of The Bahamas, Nassau - Bahamas

Discussant: Yeşim Korkut, Acıbadem University, Istanbul – Turkey

Psychology has adapted fairly quickly to the knowledge explosion and the ready access to information. There is general acceptance of difference, cultural diversity, and variance in socioeconomic status. Within the ethical domain, it would be odd for lack of tolerance, even understanding, around issues relating to race, gender, sex, pregnancy, marital status, ethnic or social origin, colour, sexual orientation, age, disability, religion, conscience, belief, culture, language and birth.

Psychology’s utility as an applied profession after the Boulder Conference (August 20 - September 3, 1949) and the espousal of the scientist-practitioner model has grown apace such that psychological insights pervade almost every facet of human endeavour and activity. The widespread decolonisation from the 1960s has seen many more distinct nations being founded. Particularly since the Polish revolution in 1989 and the demise of the USSR in 1991, there has been a clamour for democracy and its apparent corollary: human rights.

However, psychology has not been able to adapt to this global desire to effectively engage in human rights discourse, reducing the efficacy of psychological insights and relevance. This symposium will explore the role that psychology should play in contributing to the discourse on human rights.

HUMAN RIGHTS FROM A CRITICAL STANDPOINT

David Fryer

‘Human rights’, rather than essential, universal, apolitical and progressive, are a manifestation of historically contingent, culturally particular, dominant enlightenment discourses, deployed oppressively and key to the constitution of the individualised psychologised subject. “The good”, as Foucault said, “Is Invented” and so can be reinvented.

CAN PSYCHOLOGICAL SCIENCE BE ‘IMPARTIAL’ IN THE FACE OF RHETORIC AND POLICY THAT UNDERMINES HUMAN RIGHTS?

Pam Maras

Growing anti-immigration nationalist rhetoric in some parts of Europe plays on and reinforces individual/community ‘fears’. The wider human rights implications for the rest of the world’s nations and regions taking such positions and ways that psychology might relate to this will be considered, against the backdrop of ‘scientific impartiality’.

327
WHAT CAN PSYCHOLOGISTS DO ABOUT HUMAN RIGHTS?
Robert Roe
Although necessary and Important, psychological activities to help victims of Human rights violations do little to change their prevalence. This presentation will consider specific recommendations for, Inter alia, psychology’s better understanding of violations, prevention, effective intervention at national and international levels, and coordination.

PSYCHOLOGISTS AND SURVIVORS OF GROSS HUMAN RIGHTS VIOLATIONS: ENSURING VICTIMS’ RIGHTS TO JUSTICE AND REPARATION
Nora Sveaass
Perhaps the most Important human right for psychologists to be aware of Is victims’ right to reparation, including rehabilitation. Victim rights present challenges within all human rights systems, and efforts should be made to ensure that these rights are respected and enjoyed by those who have had their lives changed by violation and injustice.

HUMAN RIGHTS EDUCATION FOR A 21ST CENTURY GLOBAL PSYCHOLOGY
Ava Thompson
Ethics Is a core component In psychology curricula globally, but human rights education remains on the periphery of psychology education and training (PET), despite Its relevance for a 21st century global psychology. This presentation provides an example of curricular integration from the caribbean and the majority World, identifies critical Issues, and offers PET recommendations to promote the integration of a human rights framework Into the discourse on a global psychology.
EIS141
FEAR OF TELLING! THE ETHICS OF SUPERVISEE DISCLOSURE THROUGH AN INTERNATIONAL LENS

C01. Culture and society - Ethics and deontology
E09. Health and clinical intervention - Positivity and well-being

Convenor Carol Falender, Pepperdine University, Los Angeles - United States
Presenters Carol Falender, Pepperdine University, Los Angeles - United States
Mary Creaner, Trinity College, Dublin - Ireland
Analise O’Donovan, Griffith University, Queensland – Australia
Shirley Morrissey, Griffith University, Queensland – Australia
Discussants Stephen H. Behnke, American Psychological Association, Washington DC - United States
Jean L. Pettifor, University of Calgary, Calgary - Canada
Carole Sinclair, Independent practice, Thornhill - Canada

The major way supervisors learn about the clinical content of supervisee sessions with clients, for whom they hold primary responsibility, is through supervisee disclosure: clinical data presented in the supervision session. However, supervisees may not disclose the very topics that are essential to supervisee development, competence enhancement, and monitoring, and protection of the client. Supervisees have reported they do not disclose clinical errors, personal reactions to the client or countertransference, or personal factors about themselves and their clinical work. They may fear a negative evaluation or other consequences, or do not trust the supervisory alliance. Multiple jurisdictions approach supervisee disclosure differently with differences in Informed consent, consequences, and potential Impact on gatekeeping. In this symposium, supervisors from Australia, Ireland, and the United States will present vignettes regarding Issues of supervisee disclosure and ethical and legal intersections that Increase the complexity of supervisee disclosure. Discussants from Canada and the United States will provide additional ethical perspectives.

Objectives:
Describe an ethical or legal standard regarding supervisee disclosure in each jurisdiction
Describe one deterrent to supervisees disclosing client information in each setting

WHAT’S NOT BEING SAID AND WHY? SUPERVISEE NON-DISCLOSURE IN THE REPUBLIC OF IRELAND
Mary Creaner
Supervisee non-disclosure presents ethical challenges regarding the monitoring of best practice. Understanding these Issues helps supervisors fulfill their gatekeeping role, particularly in Ireland, where psychological therapy is not state regulated.

DISCLOSING IMPAIRMENT AND THEN WHAT? ETHICAL AND LEGAL ISSUES IN AUSTRALIA
Shirley Morrissey, Analise O’Donovan
The Psychology Board of Australia requires health professionals to report impaired practitioners including Interns. Issues include judging extent of impairment, confidentiality, informed consent and protection of the public.

**ENCOURAGE DISCLOSURE? AN ETHICAL IMPERATIVE WITH CONSEQUENCES**

*Carol Falender*

In the United States, the APA ethics code (APA, 2010, 7.04) student disclosure of personal information includes informed consent. Supervisors must carefully balance encouraging supervisee disclosure with duty to protect the client and supervisee.
Most European countries face demographic changes defined by an increase of the older population—especially the “old old” people above 80 years—while the proportion of persons within the active age between 15 to 64 years decreases. This “ageing of society” will challenge European countries on several interrelated dimensions most notably with respect to work, employment, and prosperity, but also concerning health provision and care. It is a challenge for psychology and especially geropsychology to provide sound research-based knowledge about the diverse psychological processes underlying human ageing as well as expertise about training, education and interventions that will help to promote quality of living and subjective well-being both at the individual as well as the social level. The symposium prepared by the EFPA standing committee of Geropsychology gives an insight into current research topics across Europe and it delineates at the same time trends in geropsychology that will become crucial in the next decades. Among these, one finds the notion cross-cultural images of ageing that shape our behaviour and attitudes as addressed by Ballesteros et al. (Spain), as well as the perception and evaluation of older adults with dementia which is elaborated by Gatterer and Penkner (Austria). Biological and psychosocial factors affecting survival in old age constitute another topic addressed by Despot-Lučanin and Lučanin (Croatia). Migration and coping with migration—as another current and pressing topic of the ageing society—the presentation by Durak et al. (Turkey). Soldatova and Zavialova (Russia) address psychological resources of well-being in old age and the challenges that the ageing process represents for identity formation. Finally, Stepankova and colleagues (Czech Republic) will discuss the most important issues that need to be considered in the process of establishing geropsychology as a functioning discipline before a European and a national background.

CROSS CULTURAL RESULTS ABOUT IMAGES ABOUT AGEING AND ACTIVE AGEING
Rocio Fernández-Ballesteros, University Of Universidad Autónoma De Madrid, Spain
Antonio Bustillos, Universidad Nacional De Educación A Distancia, Spain
Marta Santacreu, University Of Universidad Autónoma De Madrid, Spain
Maria Angeles Molina, Instituto De Estudios Sociales Avanzados, Spain

The study investigates whether self-perception of ageing can be considered (a) a component of active ageing, (b) to what extent perceived discrimination is influencing active aging and, (c) whether those links are present in regions of three different countries using data from three cross-sectional surveys carried out in Germany, Mexico, and Spain.
ARE THERE SPECIFIC NEEDS OF PATIENTS SUFFERING FROM DEMENTIA? – NORMALITY OR PATHOLOGY OF BEHAVIOUR?
Gerald Gatterer, Geriatric Centre Vienna; Vienna, Austria
N. Penkner, Geriatric Centre Vienna; Vienna, Austria
The study investigates psychological and behavioural symptoms of dementia and hereby focuses on the needs of older persons suffering from dementia out of the perspective of caregivers. Results indicate that needs are differently perceived and evaluated as pathological or not depending on the existence of a dementia diagnosis.

SURVIVAL AND ASSOCIATED BIOLOGICAL AND PSYCHOSOCIAL FACTORS IN ELDERLY PERSONS LIVING IN INSTITUTIONS IN CROATIA
Jasminka Despot Lučanin, Centre For Croatian Studies, University Of Zagreb, Croatia
Damir Lucanin, University Of Applied Health Sciences, Zagreb, Croatia
The aim of the research was to investigate the associations among biological factors and psychosocial factors in the prediction of survival in old institutionalized persons in a sample of retirement home residents. Differential effects are observed and discussed for psychosocial variables and biological status in explaining and predicting survival.

THE PSYCHOLOGICAL CHARACTERISTICS OF AHISKA TURKISH ELDERLY WITH A HISTORY OF FORCED MIGRATION WHO RESIDE IN THE US
Mithat Durak, Abant Izzet Baysal University, Department Of Psychology, TURKEY
Dena Shenk, Gerontology Program, Anthropology, UNC Charlotte, USA
Ekin Emiral, Bahcesehir University, Department Of Psychology, TURKEY
Ahıska Turks had been forced to migrate three times in 60 years under very stressing conditions. In this presentation, common features of Ahıska turkish elderly people living in the US and other migrated communities will be discussed using in-depth interviews conducted with the Ahıska elderly in the US.

PSYCHOLOGICAL RESOURCES OF WELLBEING OF ELDERLY
Elena Soldatova, South Ural State University, Russia
Irina Zavialova, South Ural State University, Russia
The research tested whether the normative crisis of transition to old age leads to constructive new formations of identity. Study findings indicate that psychological well-being in old ages is associated with the achieved identity and results provide evidence for the specific needs of psychological support to older adults.

ESTABLISHING A CULTURE OF GEROPSYCHOLOGY: NATIONAL CHALLENGES OF CZECH GEROPSYCHOLOGY
Hana Stepankova, National Institute Of Mental Health, Klecany, Czech Republic
Dieter Ferring, University Of Luxembourg, Luxembourg
Eva Jarolimova, Czech Alzheimer’s Society, Czech Republic
Ondrej Bezdicek, Department Of Neurology And Centre Of Clinical Neuroscience, Charles University In Prague, Czech Republic
Tomas Nikolai, Department Of Neurology And Centre Of Clinical Neuroscience, Charles University In Prague, Czech Republic
The presentation will address some of the most important issues that need to be considered in the process of establishing geropsychology as a functioning discipline. In doing so, the presentation will...
refer to general factors at the European level before focusing the situation of geropsychology in the Czech republic.
EIS143
EDUCATING SUPERVISORS AS A MEAN TO IMPROVE THE QUALITY OF PSYCHOLOGISTS’ SERVICES IN EUROPE: A SLOVENIAN – NORWEGIAN COLLABORATION

E16. Health and clinical intervention - Other

Convenor    Per A Straumsheim, Norwegian Psychological Association, Oslo - Norway
Presenters  Vlasta Zabukovec, Professor and President of Slovenian Psychologists’ Association
            President, Ljubljana - Slovenia
            Eva Danielsen, Norwegian Psychological Association, Oslo - Norway
            Anja Podlesek, University of Ljubljana, Ljubljana - Slovenia
            Vita Poštuvan, University of Primorska, Koper - Slovenia
            Tor Levin Hofgaard, President of the Norwegian Psychological Association, Oslo - Norway
Discussant  Ingrid Lunt, Chair European Awarding committee for EuroPsy; University of Oxford, Oxford - United Kingdom

In December 2014, a project with the objective to develop and implement an education for supervisors/mentors in Slovenia, was funded with over 300 000 Euro by EEA/norwegian Grants. The Slovenian and Norwegian psychological associations initiated this project several years ago. Later the University of Ljubljana has become the leading partner (applicant) in the project, and other Slovenian institutions are included: the University of Primorska and the Institute for Developmental Projects in psychological counselling. The ambition is to build a supervision model and education that integrates a competency based supervision (EuroPsy), with a supervision model that underline empowering and development of the psychologist (e.g. Via reflection and support).

The first and the second presentations focus on the different perspectives in Slovenia and Norway on supervision: The Slovenian Psychological Association have run a pilot project on implementing the EuroPsy competence model, with a focus on educating mentors in this model. In Norway, supervision has been a part of psychologist education for over 40 years, and the Norwegian Psychological Association has been offering a 2-year education for supervisors. The third presentation gives information about the history of the project, the application process and the model for educating supervisors that now are in the phase of implementation in Slovenia. In the fourth presentation, a participant that is undergoing training as a supervisor reports about her experiences from the project. The last presentation offers an overview of the need for improved quality of psychological services in many parts of Europe. Further, why supervision is necessary to develop quality, and how a project like this can contribute to meet the EuroPsy standard for psychologist education, and thereby improve the quality of psychological services. Hopeful, experiences from this project might inspire and stimulate development of similar education programs.

A CHALLENGE FOR SLOVENIA: MEETING THE EUROPSY DEMANDS FOR SUPERVISION
Vlasta Zabukovec
Tradition for supervision in Slovenia. Challenges with regard to developing high quality psychological services. The Slovenian Psychological Association have run a pilot project on implementing the EuroPsy competence model, with a focus on educating mentors in this model.
BUILDING A TRADITION FOR SUPERVISION OVER DECADES
*Eva Danielsen*
In Norway, supervision had been a part of psychologist education for over 40 years, and the Norwegian psychological association have been offering a 2-year education for supervisors.

A ROLLER COASTER: FIGHTING THE BUREAUCRACY AND DEVELOPING A SUSTAINABLE EDUCATION FOR SUPERVISION IN NO TIME
*Anja Podlesek*
The third presentation gives information about the history of the project, the application process and the model for educating supervisors that now are in the phase of implementation in Slovenia.

DEVELOPING AS A SUPERVISOR; CHALLENGES AND HIGHLIGHTS
*Vita Poštuvan*
In the fourth presentation, a participant that are undergoing training as a supervisor reports about her experiences from the project.

WHY SUPERVISED PRACTICE IS A KEY TO BUILD HIGH QUALITY PSYCHOLOGICAL SERVICES
*Tor Levin Hofgaard*
The last presentation offers an overview of the need for improved quality of psychological services in many parts of Europe. Further, why supervision is necessary to develop quality, and how a project like this can contribute to meet the europsy standard for psychologist education, and thereby improve the quality of psychological services. Hopeful, experiences from this project might inspire and stimulate to development of similar education programs.
EIS144
CONFIDENTIALITY: THREATS AND CHALLENGES

C01. Culture and society - Ethics and deontology

Convenor    Henk Geertsema, Board of Ethics of the Dutch Institute of Psychologists (NIP),
GERION/VU University Medical Center, Amsterdam - Netherlands

Presenters  Edward Van Rossen, Competent authority for psychologists in Belgium, Brussels -
Belgium
Miguel Ricou, University of Porto, Porto - Portugal
Fredi Lang, Headoffice of the Association of German Professional Psychologists
(BDP), Berlin - Germany
Alla Shaboltas, Saint Petersburg State University, Saint Petersburg - Russian
Federation
Anne Andronikof, University of Paris West, Nanterre – France

The purpose of this symposium is to discuss the threats and challenges related to the Idea of
confidentiality. Confidentiality Is at the core of many activities of psychologists. Nevertheless the
protection of one’s privacy Is not so much valued In some situations. Some examples:
(a) By using (social) media people’s attitude to privacy has changed;
(b) In many healthcare institutions care is delivered by a multidisciplinary team. They share
information about the client;
(c) The introduction of digital patient files asked for strict regulations. The reality Is that often too
many people have access to patient information;
(d) quality care institutions or healthcare cost insurance companies want information about the clients.
Do they really need It to control the professionals?
How should psychologists or the association of psychologists respond to these developments?
The objectives of this panel are: (a) to create awareness about the threats and challenges of the idea of
confidentiality; (b) to discuss these threats and challenges from different angles and from several
cultural and historical perspectives; (c) to inspire for new approaches.

THE LIMITS OF CONFIDENTIALITY SET BY THE LAW
Edward Van Rossen
Cases are presented where laws require psychologists to disclose Important and very confidential
information to the state (e.g., the police) without the patient’s consent. Such limits of confidentiality,
aimed at protecting other members of society, may discourage crucial help-seeking behaviour. Or
don’t they?

MULTIDISCIPLINARY WORKING AND CONFIDENCIALITY
Miguel Ricou
Psychology has a wide range of actuation. There are so many fields of intervention that
multidisciplinary work Is fundamental, seeking the client best Interest. In this way, disclosure Is
necessary, which can put In danger the psychologist-client private relation. Balancing these two
Important values Is mandatory.
EHEALTH & CONFIDENTIALITY

Fredi Lang

The introduction of digital patient files asked for severe regulations. Routines may lead to access to patient information by too many people. Digital structure will become safer but confidentiality of all personal and health information may be lost at once. Professionals and clients should develop preventive strategies.

CONFIDENTIALITY ISSUES IN RESEARCH AND PRACTICE: CHALLENGES FOR PSYCHOLOGISTS AND OTHER HEALTH CARE PROVIDERS IN RUSSIA

Alla Shaboltas

The typical cases of breaking confidentiality in research and psychological practices in Russia will be presented. The potential ways of promoting high standards of confidentiality regulations including the role of EFPA Board of ethics and Local ethical committees as an Instruments for managing violations of confidentiality will be discussed.

ISSUES OF CONFIDENTIALITY FOR PSYCHOLOGISTS IN A CHANGING WORLD: HOW TO RESPOND?

Anne Andronikof

The disparity of the professional statute of psychologists across countries, and the current blurring of frontiers between private and public life require thorough examination of the confidentiality Issue by professional associations, leading to a consensual set of ethical recommendations so that psychologists can, anew, exercise their personal responsibility in matters of confidentiality.
EIS145
CREATIVE RESEARCH METHODS IN COMMUNITY PSYCHOLOGY

Convenor: Jacqui Akhurst, York St John University, York - United Kingdom
Presenters: Laura Remaschi, LabCom, University of Florence, Florence - Italy
Patrizia Meringolo, University of Florence, Florence - Italy
Jacqui Lovell, York St John University, York - United Kingdom
Caterina Arcidiacono, INCORPADE Laboratory, University of Naples Federico II, Naples - Italy
Nicholas Carr, Haukeland University Hospital, Bergen - Norway
Discussant: Nicholas Carr, Haukeland University Hospital, Bergen - Norway

Community psychologists focus upon the Impact of the broader social context on individual well-being. They are concerned to make evident the exercise of power and its effects, including the resulting oppression of and discrimination against certain groups. They value diversity and are committed to action against inequalities. As such, traditional research methods are often not participatory enough, and practitioners search for methods that will engage people as co-producers of material.

The following brief and focused papers (around 15 minutes of presentation time), will highlight creative use of research methods as applied to community psychology. These papers will illustrate innovative approaches at the intersection of action and research.

AN EXPERIENCE OF GOOD PRACTICE, CARRIED OUT WITH DETAINED MINORS, THROUGH CREATIVE INSTRUMENTS
Laura Remaschi, Patrizia Meringolo
This experience is part of a European Project “outinout” aimed to promote social inclusion of detained minors, building a network among juvenile justice services and institutions. In this step creative Instruments (photos, Images, semantic maps, drawings) have been used, working in group about communication, emotions and conflictual relationships.
INCORPADE Laboratory (Department of humanities, federico II university of Naples)

THE CO-CREATION OF ‘I LOVE PORTA CAPUANA’
Caterina Arcidiacono And Co-Researchers
To go beyond psychology understood as a discipline merely interested in the study and treatment of individual disease, we need to explore how to use the knowledge of our discipline as an instrument for social change aimed at overcoming inequality and building a society that is fairer and able to meet its citizens’ needs; considering individual, Inter-generational, organizational, political, cultural, and legislative factors. We present the ‘I love Porta Capuana’ project, which included 180 undergraduate and 10 postgraduate students, taking psychology into this district of Naples, and resulting in a flashmob event. Audiovisual material describing our creative methodologies in participatory action research will be presented.

ART, INNOVATION AND BEING TRUE TO OUR VOICES, A PARTICIPATORY ACTION RESEARCH PROCESS TO EVALUATE A COMMUNITY ORGANISATION FROM THE PERSPECTIVE OF ITS DIVERSE MEMBERS
Jacqui Lovell and Jacqui Akhurst

A body mapping tool was utilised within a participatory video production process to evaluate the impact of a community organisation from the perspective of its diverse members. We will describe the development of an inclusive, bottom up, evaluation process that did not require participants to either read or write. The use of “I poems” drawing from Gilligan’s work and expanding these, which effectively allowed all of the voices of the participants to be heard through the analysis process. The process by which this participatory action research opened up our use of arts-based methods, illustrate innovative and potentially empowering elements in this evaluative process.

THE USE OF FILM DOCUMENTARIES IN COMMUNITY PSYCHOLOGY RESEARCH AND PRACTICE

Nicholas Carr

Drawing from the experience within other disciplines such as social Anthropology, social science, journalism and the Arts, community Psychology has rediscovered the film documentary as a tool for various research approaches and communications. This presentation demonstrates the increased use of film as a useful approach to community Psychology research and practice referring to recent European titles. The relevance of documentaries as a tool for evaluating and disseminating participatory research has been argued by Freedman & Brandt (2012). The Internet provides unique technical possibilities of storing and accessing film data. There is a need to explore the ethical and legal questions arising from the use of accessible film data from research projects by searching the web.
EIS146
PROFESSIONAL ETHICS, PEOPLES, AND SOCIAL JUSTICE: HOW ARE THEY CONNECTED?

C01. Culture and society - Ethics and deontology

Convenor "Janel Gauthier, International Association of Applied Psychology; Laval University, Quebec City - Canada"

Presenters Stephen H. Behnke, American Psychological Association, Washington DC - United States
Laura Hernández-Guzmán, National Autonomous University of Mexico, Mexico City - Mexico
Saths Cooper, International Union of Psychological Science, Johannesburg - South Africa
Waikaremoana Waitoki, University of Waikato, Hamilton - New Zealand

Discussant Jean L. Pettifor, University of Calgary, Calgary - Canada

Humans over the centuries have been concerned with what are good ways of thinking and acting as opposed to evil ways. In modern times, we often organize information in smaller chunks without recognizing how they fit together in our experience as human beings. The concept of “peoples” is a key concept in the universal declaration of ethical principles for psychologists, but the connection between peoples, social justice and professional ethics has yet to be explored. In this symposium, we ask how ethics, peoples and social justice are connected. The following questions will be discussed by distinguished presenters from different regions of the world:

(1) What are the implications of adding "peoples" to codes that refer to persons as individuals?
(2) Does adding "peoples" bring the code of ethics closer to encompassing social justice and broaden the scope of psychological functions?
(3) Does adding "peoples" make codes more multicultural and therefore more universal in its applications?
(4) How does adding “peoples” affect our ethical decision making?
(5) How do you define a scientific foundation for social justice Issues?

INDIGENOUS PEOPLES COMMENT ON THE APA ETHICS CODE: DE-STABILIZING THE CONCEPT OF CULTURE
Stephen H. Behnke
This presentation discusses an initiative of the APA ethics committee to invite ethnic minority psychological associations to comment on the APA ethics Code. The society of Indian psychologists, comprised of American Indian and Alaska natives, has written a commentary offering a profound critique of the APA Code: There is no culture-free perspective in ethics discourse. The presentation explores the far-reaching implications of this critique.

THE ROLE OF HUMAN RIGHTS IN ETHICS CODES IN PSYCHOLOGY
Laura Hernández-Guzmán
Codes of ethics based on human rights recognize human dignity and the need of any individual to develop in harmony and at the same time the enhancement of human condition of peoples. They balance basic freedom, equality and human dignity. Only individual ethics can influence peoples’ rights and contribute to coexistence and social justice.
RECONCILING THE IRRECONCILABLE?
*Saths Cooper*

In an ever-conflictual world, where recent geo-politics have indelibly changed how we engage as scientists and practitioners, this presentation will explore if the seemingly contradictory concepts of ethics, Peoples and social justice are connected at all and under what conditions they may be possibly connected. If ethical conduct is as highly contentious as it has become, with hardened positions being adopted, the quest for an egalitarian understanding of what the terms Peoples and social justice connote will be critically unpacked.

ETHICAL PRINCIPLES FOR WORK WITH INDIGENOUS PEOPLE – THE EXPERIENCE OF NEW ZEALAND MAORI
*Waikaremoana Waitoki*

The move towards using ‘peoples’ as a critical term within the universal declaration of ethical principles for psychologists infers community, collective experience, determination, history and culture. As indigenous peoples living our lives in the presence of a dominant majority ethnic group, maori in New Zealand, along with many other indigenous peoples around the world were often referred to as ‘populations’, rather than peoples, robbing us of our right to existence, community, voice and nationhood. The adoption of the term “peoples” is an act of social justice, in and of itself. Psychologists seeking to understand and engage indigenous peoples, individually and communally, need to understand these semantics if professional and social justice efforts are to be of benefit.
EIS147
ALTERNATIVE METHODS FOR ETHICS COMMITTEES: A CLOSE LOOK ON MEDIATION AND EDUCATIVE MEASURES

C01. Culture and society - Ethics and deontology

Convenor: Yeşim Korkut, Acıbadem University, Istanbul - Turkey
Presenters: Pierre Nederlandt, Fédération Belge des Psychologues, Galerie Agora, Bruxelles - Belgium
Nina Dalen, EFPA Board of Ethics; Board of the Norwegian Psychological Association, Oslo - Norway
Henk Geertsema, Board of Ethics of the Dutch Institute of Psychologists (NIP), GERION/VU University Medical Center, Amsterdam - Norway
Discussants: Yeşim Korkut, Acıbadem University, Istanbul – Turkey
Edward Van Rossen, Competent authority for psychologists in Belgium, Brussels - Belgium

When confronted with severe ethical dilemmas and ethical violation cases, ethical committees often choose to follow the adjudication process. In some cases they do employ educative measures, or very rarely mediation technique.

Mediation is a voluntary, and more flexible process using a neutral third party to develop a reciprocally accepted resolution of the conflict between the two sides. It can be a very useful method to employ in certain cases. Educative methods can include letters, extra training, or suggestion of therapy.

Objectives of this symposium can be summarized as follows: (1) To raise awareness about educative methods and especially about mediation technique as an alternative to adjudication in some cases (2) To introduce EFPA mediation guideline (3) To hear perspectives from various countries about these various techniques, including mediation, namely from Norway and Netherlands (4) To bring together all the information, comments shared on the presentations, and to ensure time for audience questions and discussion, via the existence of a discussant.

EFPA’S GUIDELINES ON MEDIATION
Pierre Nederlandt,
In 2007 the General Assembly of EFPA approved a paper presented by the standing committee of ethics headed « guidelines on mediation in the context of complaints about unethical conduct ». These guidelines give guidance to the EFPA member associations on the use of mediation as a mean for the complainant and the accused psychologist to come to a settlement by themselves, facilitated by a third party. All colleagues interested in mediation may find here useful recommendations.

THE FUNCTION AND SCOPE OF AUTHORITY OF ETHICS COMMITTEES. A DISCUSSION OF DIFFERENT METHODS INCLUDING MEDIATION.
Nina Dalen
In many European countries, how the psychological associations should handle complaints against members, are subject to an extensively debate. One argument is, being able and willing to discipline own members, give more credibility in the society. Other advocates the benefit of a more non-judgmental process. Pro and cons relative to different methods will be discussed.
MEDIATION : THE CLIENT’S PERSPECTIVE
Henk Geertsema
Mediation can be a useful way of dealing with a client’s complaint. In this presentation we will discuss the added value of mediation in a field in which there are already several possibilities to deal with complaints, like the complaints commissions of organization, the complaints boards of psychological associations and several governmental bodies. Who will benefit from mediation?

DISCUSSION: FUTURE POSSIBILITIES FOR ETHICS COMMITTEES
Yesim Korkut
All the information shared on the presentations, the stance of EFPA regarding mediation technique, the experiences with other methods than adjudication will be brought together. Perspectives from other EFPA countries will be shared. Future possibilities and needs will be discussed together with the audience.
EIS148
EUROPSY BASIC AND SPECIALIST CERTIFICATES: STATE OF ART AND CHALLENGES

D01. Work and organization - HR assessment and development
E01. Health and clinical intervention - Assessing and accrediting quality of psychotherapy training and practice

Convenors:
- Salvatore Zappalà, Alma Mater Studiorum - University of Bologna, Cesena - Italy
- Ingrid Lunt, University of Oxford, Oxford - United Kingdom
- Rosaleen McElvaney, Dublin City University, Dublin - Ireland
- Lourdes Munduate, Hispalense University of Sevilla, Sevilla - Spain
- Per A Straumsheim, Norwegian Psychological Association, Oslo - Norway

Discussant:
José M. Peiró, University of Valencia, Valencia – Spain

The europsy (or european certificate in psychology) represents a major step forward in promoting the mobility of psychologists and the access of clients to psychological services of high quality across Europe. It presents a set of European standards for psychology that is serving as the basis for evaluating the academic education and professional training of psychologists across the different countries of the EU, and other countries within EFPA.

Europsy (the European certificate in psychology) provides the standards required for independent practice at basic level. Specialist certificates in psychotherapy, and in work and organizational psychology, have been developed to demonstrate the achievement of a specialised or advanced level of competence and expertise in these particular areas of practice.

Currently twenty countries are participating in europsy. Such countries established a national awarding committee (NAC), the body that awards, within a country, the European basic certificate. The symposium will give an update of the europsy basic certificate project.

The minimum standards that European psychologists should meet in order to qualify for independent practice in the field of psychotherapy and work and organizational psychology have also been developed and tested, respectively, in 2010 and 2013. These two specialist certificates have been launched European wide. This symposium aims to inform ECP participants and psychological associations about the aims and conditions necessary to implement the project. It also aims to inform the larger audience of psychologists attending the ECP about the educational and learning activities that psychotherapists and W&O practitioners are expected to attend after graduation, as well as the competences to develop during their career in order to be awarded the specialist certificate.

THE EUROPSY PROJECT: AIMS AND CHALLENGES OF THE BASIC AND SPECIALIST CERTIFICATES

Ingrid Lunt

This contribution will present reasons to launch and establish the Europsy project. In addition, a state of the art of the actual implementation of the basic Europsy in the 20 countries, that have a NAC, will be described. Finally, the speaker, that started the project and is chairing and leading the European awarding committee, will discuss the long-term objectives of the project.

IMPLEMENTATION OF THE SPECIALIST CERTIFICATE IN PSYCHOTHERAPY

Rosaleen McElvaney
In this contribution, Rosaleen McElvaney, chair of the specialist European awarding committee, will present the results of the implementation of the specialist certificate in Psychotherapy. The training standards for psychologists specialising in Psychotherapy, developed for this certificate, as guidelines for the future, will also be outlined. This proposal concerns the curriculum the training institutions and other important components of the training.

THE PILOT PROJECT AND THE STANDARDS FOR THE SPECIALIST CERTIFICATE IN WORK AND ORGANIZATIONAL PSYCHOLOGY
Salvatore Zappalà
This contribution will present the standards that were developed for this certificate and will mention the results of the pilot project, which was run in five European countries, in order to test the standards developed for the specialist certificate in Work and organizational Psychology. Information to be provided, in order to implement this certificate in all European countries, will also be presented.

COMPETENCES IN THE SPECIALIST CERTIFICATE IN WORK AND ORGANIZATIONAL PSYCHOLOGY
Lourdes Munduate
Competences are an innovative component of the Europsy project. Different set and amount of competences have been established for the basic and specialist certificates. The challenges involved in assessing, measuring and giving evidence of competences will be discussed.

EDUCATIONAL ACTIVITIES AND CONTINUOUS PROFESSIONAL DEVELOPMENT IN THE SPECIALIST CERTIFICATES IN WORK AND ORGANIZATIONAL PSYCHOLOGY
Per A Straumsheim
The specialist certificates set standards for training, and post degree educational and learning activities. Such activities still take many different forms and duration across European countries, and matching such activities with the standards may be not so easy and immediate. Building on the experience of the pilot test of the specialist certificate in Work and organizational Psychology, examples of such learning activities will be presented, and suggestions on how to count them will be offered.
EIS149
INTEGRATING PERSONAL VIRTUE AND CHARACTER INTO THE TEACHING OF ETHICS AND ETHICAL DECISION MAKING: SHOULD IT BE DONE? CAN IT BE DONE?

C01. Culture and Society - Ethics and deontology

Convenor Carole Sinclair, Independent practice, Thornhill - Canada
Presenters Carole Sinclair, Independent practice, Thornhill - Canada
Yeşim Korkut, Acibadem University, Instanbul - Turkey
Terry Simpson, Edith Cowan University, Joondalup - Australia
Stephen H. Behnke, American Psychological Association - Ethics Office, Washington DC - United States
Discussant Carol Falender, Pepperdine University, Los Angeles; UCLA University of California, Los Angeles - United States

The majority of previous dialogue on the teaching of ethics has tended to emphasize the development of skills in ethical decision making and the knowledge of ethical principles and rules, with the assumption (and some evidence) that such skills and knowledge increase the likelihood of ethical behaviour. However, there seems to be increasing concern and belief (and, again, some evidence) that the development of such skills and knowledge may not be enough — that there are personal factors and vulnerabilities that can strongly influence a psychologist’s ability or willingness to apply his or her knowledge and skills to a particular situation or dilemma. The concepts of “virtue” and “character” are often drawn upon to understand and explore these personal factors. In order for the profession of psychology to meet its responsibilities to society, it is important for us to explore the role of virtue and character in ethical behaviour, including the need for their integration into the ethics training of its members. The objectives of this symposium are: (a) to stimulate international dialogue regarding whether personal virtue and character should and can be integrated into the teaching of ethics, and (b) to explore existing and potential methods for doing so. In this symposium, one presenter will trace the history of attention to virtue and character in professional ethics across time and across professions; two presenters, each from a different part of our global community of psychologists (Turkey and Australia) will explore ideas and methods for integrating such concepts into the teaching of ethics; and a fourth presenter will explore, in the context of codes, the complexities involved in making a distinction between professional and personal behaviour. A discussant will provide comments and reflections on the presentations, and time will be available for audience questions and discussion.

A BRIEF HISTORY OF THE ROLE OF VIRTUE AND CHARACTER IN PROFESSIONAL TRAINING
Carole Sinclair
Attention to the role of virtue and character in professional training has varied from ancient times to the present. The history of and reasons for these changes will be traced, and the implications for current ethics training will be explored.

WORKING WITH DIFFERENT TECHNIQUES AND MODELS IN TEACHING ETHICS AND ETHICAL DECISION MAKING: MORE EMPHASIS ON VALUES CLARIFICATION AND PERSONAL AWARENESS
Yeşim Korkut
Ethics training usually involves teaching rational problem solving. However, a lack of self-awareness often seems to be a factor in cases coming before ethics boards. Teaching methods to increase the depth of problem solving will be discussed.

HELPING GRADUATES BECOME VIRTUOUS PSYCHOLOGISTS: AN AUSTRALIAN PERSPECTIVE
Terry Simpson, Terry Simpson, Alfred Allan, Maria M. Allan, & Francesca A. Bell
Australian researchers believe psychologists must be virtuous. We consider what it means to be a virtuous psychologist, what role training programs have to play in helping their graduates become virtuous psychologists, and, how this may be done.

FINDING VIRTUE IN OUR CODES: CHALLENGING THE PROFESSIONAL/PERSPECTIVE
Stephen Behnke
Ethics codes typically distinguish between professional and personal behavior. This distinction is more complex and nuanced than often understood. The presentation explores how virtue may emerge from these liminal spaces in our ethics codes.
EIS150
CLINICAL PSYCHOLOGY AS A REGULATED HEALTH PROFESSION: LAND OF OPPORTUNITY OR PANDORA’S BOX?

E22. Health and clinical intervention - Other

Convenor  Koen Lowet, Belgian Federation of Psychologists, Brussels - Belgium
Presenters  Pauline Adair, University of Strathclyde, Glasgow - United Kingdom
          Anders Skuterud, Norwegian Psychological Association, Oslo - Norway
          Anne-Christine Volkart, Swiss Federation of Psychologists, Bern - Switzerland
          Koen Lowet, Belgian Federation of Psychologists, Brussels - Belgium
Discussant  Claus Vögele, Université du Luxembourg, Walferdange - Luxembourg

Clinical psychologists are important actors in the broad domain of health. In most EU countries the practice of clinical psychology is regulated by laws, which explicate the qualifications required for the practice of psychological intervention, such as psychotherapy covered by the health care system. This is a major achievement on the way to better quality assurance and standardisation of evidence-based health care. Nevertheless, harmonization of these laws across EU member states is still in its infancy, and there are significant differences in terms of the required qualifications for the practice of clinical psychology/psychotherapy, study programmes and intervention approaches accepted into national directives. This symposium aims to exemplify the current state-of-affairs of the practice of clinical psychology with contributions from a number of EU member states and address questions concerning the consequences of differences and commonalities.

THE PRACTICE OF CLINICAL AND HEALTH PSYCHOLOGY IN THE UK
Pauline Adair
Clinical psychologist and Health psychologist are two domains of practice in the UK. A register is held by the Health Care and professions council (HCPC) since 2009 when registration became mandatory. Those registered with HCPC are permitted to use the titles practitioner psychologist or registered psychologist as well as a domain specific title depending on registration. The process to registration as well as the requirements for continuing this will be discussed.

THE PRACTICE OF CLINICAL AND HEALTH PSYCHOLOGY IN NORWAY
Norway has a long standing tradition in applying knowledge for psychological research into various health domains. The practice of clinical and health psychology has been regulated for quite some time now. This gives us the advantage to look back and see what this regulation has meant for the psychologists in the field.

THE PRACTICE OF CLINICAL PSYCHOLOGY AND PSYCHOTHERAPY IN SWITZERLAND
Anne – Christine Volkart
Recently, a new law was adopted in Switzerland to protect the title of psychologist and regulate the standards of basic and postgraduate training in psychological professions. The law is interesting as it is one of the most recent in Europe and focusing not only on the protection of the title of psychology, but also regulating the practice of psychological professions, like psychotherapy.
THE CLINICAL PSYCHOLOGIST (FINALLY) RECOGNISED AS A HEALTH PROFESSIONAL IN BELGIUM: HISTORY, REALITY AND THE FUTURE.

Koen Lowet

This symposium aims to explain the history and the new law which regulates the profession of the clinical psychologists as a health profession and regulates the practice of psychotherapy in Belgium. Over 20 years Belgian psychologists have tried to get their profession recognised in a federal system dominated by physicians. The new law grants the clinical psychologists autonomy in his/her work and is therefore considered to be a great victory in the evolution to a multidisciplinary health care system. The purpose of this symposium is to explain the process, the making of this new law and its possible consequences (positive and negative) for clinical psychology in Belgium. We hope to give a contribution to other countries who are struggling for legal recognition and exchange/compare with other European countries that have already installed legislation for clinical psychologists.
EIS151
CULTURE AND ETHNIC DIVERSITY – CURRENT ISSUES FOR THE PSYCHOLOGISTS’ PROFESSION

C18. Culture and society - Other

Convenor Ludek Kolman, Czech University of Life Sciences, Prague - Czech Republic
Presenters Alexander Thomas, Universität Regensburg, Cologne - Germany
Carla Moleiro, University Institute of Lisbon ISCTE-IUL, Lisbon - Portugal
Sylvie Graf, Academy of Sciences of the Czech Republic, Brno - Czech Republic
Discussant Ulrike de Ponte, University of Applied Science Regensburg, Regensburg – Germany

The symposium focuses on subject matter closely connected to the current task of the Taskforce for Culture and ethnic diversity. The most pressing undertaking the members of the Taskforce address their efforts to concerns preparation of guidelines for the incorporation of knowledge on (the implications of) Cultural and ethnic diversity In the education and professional work of psychologists In various areas. Part of this effort Involves proposing ways of the development of curriculum components on Cultural and ethnic diversity at the bachelor and master levels In the study of psychology students. As It could be evidenced In the symposium program, all the presentations deal with the topics connected or closely related to the stated purpose. Alexander Thomas’ presentation and workshop deal with ways of achieving Intercultural competence. Carla moleiro adds concern for ethical standards In the field and my own presentation tries to find a way to a less complex and because of It less costly training In the same area. The presentation of Graf and zingora brings new knowledge on a rather theoretical, but at the same time exceedingly practical task of benefits of ethnic diversity.

InterCultural Competence is Psychology
Alexander Thomas

Intercultural Competence presupposes processes of development and learning of a special sort. Psychology can offer systematic and theory-based training to enable experiential learning. This presentation will show some contributions that psychology and psychological theories can offer to this field of learning and experience, and to the development of Intercultural competence.

Ethical Standards for Psychologists Working with Culturally and Ethnically Diverse Populations: The Interplay between Ethical Principles and Ethical Virtues
Carla Moleiro

In an increasingly diverse European context psychologists need to be able to work with people who are culturally different from themselves. The present presentation will explore the development of
ethical standards for psychologists working with culturally and ethnically diverse populations. A set of specific standards will be explored and discussed.

ETHNICAL AND CULTURAL DIVERSITY – WORKSHOP
Alexander Thomas
Intercultural competence can be understood as a key competence. As fundamental assumptions it is claimed (I) that there exist specific methods to achieve this competence; and (II) there are established methods that result in a lifelong learning processes concerning this end. This workshop will be focused on developing a curriculum of intercultural competence for BA and MA programs of psychology students.

BENEFITS OF ETHNIC DIVERSITY: SECONDARY TRANSFER EFFECT FROM INTERGROUP CONTACT WITH VIETNAMESE TO PREJUDICE AGAINST ROMA
Sylvie Graf & Tibor Zingora
Prejudice solidifies existing boundaries between groups and segregation perpetuates distrust and animosities between their members. One of the most effective ways to reduce prejudice is by having members of different groups engage in contact with each other. Intergroup contact does not only reduce prejudice against the encountered outgroup, but also against other less frequently encountered groups.

INTERCULTURAL SENSIBILITY TRAINING
Ludek Kolman
The paper deals with the development of intercultural sensibility training for psychologists, and demonstrates techniques which might be employed to accomplish the training objectives. The training course discussed aims to help understanding and getting experience of the trainees concerning the differences of individualist and collectivist cultures which seems to be rather important in communication.
EIS152
INTERNET AND SOCIAL MEDIA: ETHICAL CHALLENGES

C01. Culture and society - Ethics and deontology

Convenor Nina Dalen, Norwegian Psychological Association - Hospital Trust: Local medical center, Outpatient Psychiatry Clinic - Private practice, Hovet - Norway

Presenters Vita Poštuvan, University of Primorska, Koper - Slovenia
Karin Kalteis, Klinische und Gesundheitspsychologin - Psychotherapeutin (Existenzanalyse), Wien - Austria
Henk Geertsema, GERION/VU University Medical Center, Amsterdam - Netherlands
Miguel Ricou, University of Porto, Porto – Portugal

Occasionally we realize that the technological development Is a step ahead of us. The expanding role of technology In the provision of psychological services present opportunities and challenges. Nowadays children and adolescents make use of the Internet as an Integral part of everyday life. Computers, Internet and social media In general, constitute a big source of information. The activities are interactive, dialogical and participatory. There are special ethical challenges for psychologists using technology In their practices, like long distance intervention, as well as for psychologists who asked to provide advice and guidance on children's and adolescents Internet use. EFPA guidelines for psychologists who contribute to the media as a framework, will be presented.

In this panel, presenters from EFPA Board of ethics (boe) , will portray us, various difficulties regarding Internet, and social media usage and we will be able to discuss about the ethical dilemmas arising.

ETHICAL COMPETENCES IN MEDIA REPORTING TO PREVENT (YOUTH) SUICIDES

Vita Poštuvan

Inadequate and inappropriate media reports of suicide and suicidal behaviour might be followed by copycat behaviour. Competences of professionals Involved In the media reporting on suicide play a vital role In prevention. Among them, the awareness that suicide reporting should not be misused for commercial purposes and that the confidentiality should always be a priority. Ethical Issues will be addressed.

THE EFPA MEDIA GUIDELINES: DEVELOPMENT AND IMPLEMENTATION

Henk Geertsema

In 2011 the EFPA Board of ethics presented the guidelines for psychologists who contribute to the media. The reason for developing these guidelines and some of the highlights are presented. Some questions from the discussion In the Netherlands as part of the implementation are discussed. I will argue that we will need some sharper definitions at some points In order to give real support to psychologists.

ETHICAL ISSUES FOR PSYCHOLOGISTS USING NEW MEDIA

Karin Kalteis

Modern technologies are offering new ethical challenges: online personal and professional activities, extra-therapeutic contacts, testimonials and communication. Ethical Issues are confidentiality, privacy, multiple relationships, self-disclosure and transparency.
PSYCHOLOGY AND LONG DISTANCE INTERVENTION

Miguel Ricou

Abstract: ethics It’s the science of relation. In psychology, the relation It’s the main way to Improve Its intervention’s goals. One of the main challenges today, It’s the introduction of the new communication technologies, promoting new opportunities to work In a more distant way. We pretend to discuss the advantages and disadvantages of It.
EIS153
ABOUT UNDERSTANDING ROAD USERS

D10. Work and organization - Traffic and transportation

Convenor
Ralf Risser, University of Vienna - FACTUM Chaloupka & Risser OG, Vienna - Austria

Presenters
Bettina Schützhofer, Sicher unterwegs – Verkehrspychologische Untersuchungen GmbH, Vienna - Austria
Andrew Kenneth Tolmie, University of London, London; EFPA Standing Committee on Traffic Psychology, London - United Kingdom
Christine Chaloupka, FACTUM Chaloupka & Risser OG, Vienna - Austria
Ralf Risser, University of Vienna - FACTUM Chaloupka & Risser OG, Vienna – Austria

This symposium deals with verbal data, i.e. with the information we get via the exchange of spoken words in a more or less standardised way. The psychologist has to make sure that information received in this way allows to receive valid, reliable and objective information. This is a difficult task that can only be fulfilled approximately, and by using psychological theory and empirical and heuristic experience. In one presentation verbal information received from witnesses will be discussed and how the quality of such information can be assured. Another presentation will deal with the marketing theory and there especially with the part that is called information policy; how to find out about the problems, needs and interests of target persons and target groups with the help of interviews and questionnaires. One author will talk about traffic culture and how this influences the behaviour of road users in a stochastic sense. And finally, one presentation focuses on professional drivers and their special problems. In all these cases motives play an important role, both concerning the will to say the truth or not (i.e. when one wants to hide not wished for personality states, attitudes or behaviour), and concerning the issue of problems, needs and interests; the latter could be complex, not reflected, ambiguous, or hidden even to the individual itself. Not least, verbal data can reflect compensation potential for performance problems. The use of standardised quantitative methods will be of no help in all of these cases. The motto is "qualitative methods help to discover phenomena that are reflected by verbal data, and quantitative methods serve to measure the distribution of such phenomena in any chosen population". It is clear, though, that except for marketing all discussed procedures usually deal with single individuals and to develop methods for measuring (e.g. personality questionnaires) will be possible and useful only after very long periods of collecting experiences with single individuals, or otherwise with the help of intensive qualitative analyses that have the goal to provide materials that can be used in the frame of standardised procedures.

THE VALIDITY OF EYE-WITNESS MEMORY AND TESTIMONY AFTER A TRAFFIC ACCIDENT

Bettina Schützhofer & Dr. Ralf Risser

Eye-witness testimony is an important knowledge source after a traffic accident and helps to reconstruct it. Scientific evidence shows that there is sometimes a lack of quality when it comes to witness statements. This is e.g. due to awareness phenomena, trauma or non-optimal interrogation styles.
THE PSYCHOLOGICAL SCREENING OF OCCUPATIONAL DRIVERS AND IMPLICATIONS FOR RISK REDUCTION: UK POLICY AND PRACTICE
Professor Andrew Kenneth Tolmie
A fifth of UK road injuries involve someone driving for work, yet commercial drivers do not legally have to be assessed on the psychological skills needed to perform competently. The impact on accidents and the benefits of testing will be considered.

HOW DOES SAFETY CULTURE BECOME VISIBLE IN A SOCIETY?
Christine Chaloupka
Safety culture management including problematic attitudes or behaviour has been discussed recently intensely in industries. Indicators of organisational safety culture shall help to improve effective culture-enhancing practices in traffic safety.

TRAFFIC SAFETY MARKETING: A STRUCTURED COMMUNICATION WITH TARGET GROUPS BASED ON UNDERSTANDING THEM
Ralf Risser
Marketing theory postulates that products, concepts, or ideas can be sold – or "sold" – to intended target groups only if the needs, interests and problems of these target groups in the frame of their demographic context is known and considered. This requires motive research, i.e. sophisticated combination of qualitative and quantitative questioning procedures.
EMPIRICAL FIELD WORK

D10. Work and organization - Traffic and transportation

Convenor Ralf Risser, University of Vienna - FACTUM Chaloupka & Risser OG, Vienna - Austria

Presenters Christine Chaloupka, FACTUM Chaloupka & Risser OG, Vienna - Austria
Mirna Benigni, Noisicuri Project, Brescia - Italy
Jens Schade, EFPA Standing Committee on Traffic Psychology; University of Dresden, Dresden - Germany
Matus Sucha, Palacky University, Olomouc - Czech Republic
Ralf Risser, University of Vienna - FACTUM Chaloupka & Risser OG, Vienna – Austria

How well traffic works with respect to both safety but also other qualities – comfort, accessibility, etc. – should be possible to assess empirically. For instance, for safety assessment it is not advisable to rely only on accident data, which are actually reconstructions of events and not empirical procedures, and which actually should be avoided instead of serving as a statistical data basis. Empirical data have the potential to provide information about how and why risky situations emerge that may lead to accidents. By steering these processes in a different way it should theoretically be possible to avoid accidents. Thereby it seems easier to relate operational behaviour (michon) to risks than higher-level behaviour, like strategic thinking or even the cultural background of persons. In this seminar, though, we will also discuss higher-level factors and how they could possibly be measured, and then proceed to more tactical and operational aspects in the presentations that follow: Rule breaking and how this is anchored, and the communication between pedestrians and car drivers as a source for many dangerous situations – mostly to the disadvantage of the pedestrians. Moreover methods to observe road user behaviour and road user interactions will be presented. With the help of those methods it should be possible to identify risks connected to this behaviour and to the interaction between road users. The goal should be two-fold; to identify risky behaviour, interactions and situations in order to assess risks without having to rely on "sufficient" amounts of accidents for sound statistical analyses; and to identify countermeasures based on empirically founded knowledge of the reasons for dangerous behaviour and interactions. This does not make national accident statistics superfluous but should pave the way to the so-called vision Zero: i.e. to a future when safety on the road starts resembling flight and rail safety, both transportation modes that are exponentially more safe than road traffic.

PSYCHOSOCIAL CORRELATES OF TRAFFIC AND SPEED TRANSGRESSIONS IN ITALIAN TEENS: THE RESULTS OF NOISICURI PROJECT RESEARCH
Mirna Begnini, Manuela Bina, Valeria Basili

The study was aimed to investigate driving behaviours, risky driving and their psychosocial correlates in more than 500 adolescents, aged 12-20, living in the Italian municipalities taking part in Noisicuri Project (national project of road safety).

RULE ACCEPTANCE AND COMPLIANCE OF PEDESTRIAN' AND BICYCLISTS AT SIGNALIZED INTERSECTIONS
Jens Schade & Lars Rössger
Since walking and bicycling are being promoted for its health and environmental benefits, minimisation of its associated risks is of interest. We investigate the determinants of red light running using both subjective (self-reported) and objective (observational) data.

DRIVERS AND PEDESTRIANS INTERACTION AT UNSIGNALISED CROSSINGS IN URBAN SETTINGS
Matus Sucha
The Author In this paper presents outcomes of a field study focused on interaction between pedestrians and drivers when they meet at unsignalised crossings in urban areas. Mixed methods design was used to collect and analyse data, counting 1584 observations.

IN-CAR BEHAVIOUR OBSERVATION AS A COMPLEMENT TO NATURAL DRIVING STUDIES
Ralf Risser
A behaviour observation from inside the car of observed subjects is presented, together with validity and reliability data, the occasions of use in research and diagnostics, and the theoretical background concerning, e.g., the problem of obtrusiveness. Variables and in which way they reflect safety and other issues are discussed extensively.
EIS155
ETHICS ADJUDICATION: SUBSTANCE, PROCESS, AND SPECIAL CHALLENGES
THE NORTH AMERICAN EXPERIENCE

C01. Culture and society - Ethics and deontology

Convenor Stephen H. Behnke, American Psychological Association, Washington DC - United States

Presenters Stephen H. Behnke, American Psychological Association, Washington DC - United States
Yeşim Korkut, Yudit Namer, Acibadem University, Istanbul; Turkish Psychological Association, Ankara; Gediz University, Izmir - Turkey
Nina Dalen, Norwegian Psychological Association, Oslo - Hospital Trust: Local medical center, Outpatient Psychiatry Clinic - Private practice, Hovet - Norway
Henk Geertsema, GERION/VU University Medical Center, Amsterdam - Netherlands
Miguel Ricou, University of Porto, Porto – Portugal

The purpose of these two Interrelated panels Is to provide a comprehensive overview of ethics adjudication among North american and EFPA member psychological associations. The panels will examine the process of creating and administering an ethics adjudication program, the types of cases that come before ethics committees and appellate panels, and special challenges that arise for associations such as when a psychologist accused of unethical conduct knows several members of the ethics committee or when a prominent member of the association attempts to exert Influence over the outcome of an ethics case. Finally, the panels will address the relationship between psychological association ethics committee and government bodies such as licensing boards and colleges In the adjudicatory process. The objectives of this panel are: (a) to provide a detailed description of how psychological associations adjudicate ethics complaints; (b) to convey the Importance of upholding the ethical standards of the profession of psychology and the value of an adjudication program to achieve that goal; (c) to describe the kinds of cases that are brought before ethics committees; (d) to explain how psychological associations may develop and administer an ethics adjudication program; (e) to compare ethics adjudication programs In North america with programs In EFPA member countries; and (f) to distinguish the role of psychological association adjudication programs from government regulatory bodies.

ESSENTIAL ELEMENTS IN ETHICS ADJUDICATION: NOTICE AND DUE PROCESS
Stephen Behnke
The presentation will address the essential elements of notice and due process in apa’s adjudication program. The presentation will explain why notice and due process are critical and the legal relevance of ensuring that all psychologists accused of ethical wrongdoing receive them.

ARE LICENSING BOARDS, NATIONAL ASSOCIATIONS, OR GOVERNMENT ENTITIES BEST EQUIPPED TO ADJUDICATE CASES? THE CANADIAN EXPERIENCE
Carole Sinclair
Psychologists often join more than one psychology organization. In Canada, this may Include a licensing board, a national association, a provincial association, and a government-sponsored specialty
body. The same ethics complaint sometimes is filed with more than one of these organizations. This presentation will outline Canadian practices regarding this issue and the rationale for these practices.

ETHICS CASES: NATURE AND FREQUENCY IN THE UNITED STATES
Lindsay Childress-Beatty
This presentation offers a comparison to the presentations in Panel I by describing the nature and frequency of matters that come to the APA ethics program. The presentation will highlight similarities and offer contrasts between the work of ethics committees in the US and EFPA member countries.

REFLECTION ON THE NORTH AMERICAN EXPERIENCE: THE VALUE OF ETHICS EDUCATION PRECEDING ETHICS ADJUDICATION
Yesim Korkut
APA and CPA have both not only a good tradition of adjudication but also they share an understanding of education preceding ethics adjudication. APA from years of 2000 on has valued a lot educating, consulting, and training psychologists. CPA has also the mission of assuring ethical behaviour by guiding and teaching its members. We will have a close look to their preventive approaches.
EIS156
ETHICS ADJUDICATION: SUBSTANCE, PROCESS, AND SPECIAL CHALLENGES
THE EXPERIENCE OF EFPA MEMBER COUNTRIES

C01. Culture and society - Ethics and deontology

Convenor Stephen H. Behnke, American Psychological Association, Washington DC - United States

Presenters Stephen H. Behnke, American Psychological Association, Washington DC - United States
Carole Sinclair, Independent practice, Thornhill - Canada
Lindsay Childress-Beatty, American Psychological Association, Washington DC - United States
Yeşim Korkut, Acibadem University, Instanbul – Turkey

The purpose of these two interrelated panels is to provide a comprehensive overview of ethics adjudication among north american and efpa member psychological associations. The panels will examine the process of creating and administering an ethics adjudication program, the types of cases that come before ethics committees and appellate panels, and special challenges that arise for associations such as when a psychologist accused of unethical conduct knows several members of the ethics committee or when a prominent member of the association attempts to exert influence over the outcome of an ethics case. Finally, the panels will address the relationship between psychological association ethics committee and government bodies such as licensing boards and colleges in the adjudicatory process. The objectives of this panel are: (a) to provide a detailed description of how psychological associations adjudicate ethics complaints; (b) to convey the importance of upholding the ethical standards of the profession of psychology and the value of an adjudication program to achieve that goal; (c) to describe the kinds of cases that are brought before ethics committees; (d) to explain how psychological associations may develop and administer an ethics adjudication program; (e) to compare ethics adjudication programs in north america with programs in efpa member countries; and (f) to distinguish the role of psychological association adjudication programs from government regulatory bodies.

THE VALUE OF ETHICS ADJUDICATION
Stephen Behnke
This presentation will highlight the importance of ethics adjudication in upholding the standards of the profession. The presentation will underscore the important relationship between adjudication and education, and will emphasize that adjudication is more effective when it does not have a punitive tone or intent.

DEVELOPING AN ETHICS ADJUDICATION PROGRAM IN TURKEY
Yeşim Korkut, Yudit Namer
Tpa has adjudication activities from 2004 on after the ethics codes were officially accepted. In this presentation tpa administrative board ethics - responsible member and chair of ethics committee will first together portray the steps after a complaint arrives, at tpa. Then we will discuss our mission at the initial phase and the challenges we had through time.
ETHICS CASES: NATURE AND FREQUENCY IN NORWAY
Nina Dalen
The Norwegian psychological association organizes 8000 members, 90 percent of authorized psychologists. During 2013, the ethics committee received 67 written complaints, and the appeals committee received 10 cases. 4 psychologists had their authorization withdrawn by the Norwegian board of health. Quality control in the light of ethics adjudication will be discussed.

SPECIAL CASES IN ETHICS ADJUDICATION
Henk Geertsema
In the process of adjudication, several parties are involved: the client with a complaint, the psychologist, the board which hears the complaint, and the psychological association. Each party has unique possibilities and challenges. I will stress the critical importance of the principle of separation of powers.

THE EXPERIENCE OF ETHICS ADJUDICATION IN PORTUGAL
Miguel Ricou
Ethics adjudication should have a pedagogical aspect to make it legitimate and fair. The number of psychologists in Portugal has risen dramatically, thus pedagogy in ethics is critical to our association. I will present the first three years experience of adjudication in the Portuguese association.

ABSTRACT BOOK

ORAL

PRESENTATIONS
Emotional Intelligence (EI) refers to the abilities/competencies that an individual has about emotions. Consumer behavior is still a new venue of research. Kidwell et al. (2008) propose Consumer Emotional Intelligence Scale (CEIS) under the ability model with good results in USA and China. Our purpose was the adaptation and validation of CEIS in Spain. For the linguistic and cultural adaptation we follow the International Test Commission guidelines. Four American and 4 Spanish made the process finally discussed by three researchers. This process revealed the existence of cultural differences in building sentences with linguistic nuances interpreted positively or negatively by various judges. For the evaluation phase and consensus, a pilot with forty participants indicated a good understanding and clarity of the items. For validation we followed the same original scale procedure. We use two different samples (132 undergrads; 120 non-undergrads, n = 252) to determine construct validity. Preliminary analyses show that it is not consistent with the original structure. Statistical indicators indicate a poor correlation between items, and the test-retest points to a lack of reliability, even obtaining significant and negative correlations among many of the items. Our results question the usefulness of CEIS in Spain. Thus, we propose to create a new tool that overcomes the shortcomings of the CEIS and allow us to apply it to decision-making on the use of healthy food products.
Islamic Radicalism has become a serious problem in central Asia and Caucasus as well as other regions of the world having predominantly Muslim population. The causes of this radicalization are hotly debated. It is the aim of this investigation to present an inclusive fact finding research with the hope of shedding some light on various probable sources of Islamic Radicalism in the Central Asian nations. To this end, attention has been given to both internal and external factors of extremism as opposed to some researches that have focused exclusively on either internal or external factors. In this paper, it is argued that internal factors such as religious oppression during Soviet rule, economic backwardness, low level education, sociopolitical unawareness, and the existence of historically famous religious cities which prior to communist regime functioned as the centers of Islamic educational training and ideology fostered religious extremism. With respect to external factors, it is argued that Saudi Arabia along with Emirate, Qatar and Pakistan, all predominately belonging to Sunni sect of Islam, in their rivalry to contain the propagation of Shia sect by the Islamic Republic of Iran in these newly independent nations of Central Asia, provided spiritual and financial support to the mostly deprived, marginalized and agonized segments of the Sunni Muslim population to be armed and trained mainly in Pakistan and Afghanistan to propagate and defend Sharia violently if necessary. Secondly, the dawn fall of Taliban rule in Afghanistan after September 11 led to the fleeing of some Al-Qaeda members to the neighboring nations as their safe heaven which resulted in making them the militant defenders of Islamic codes of behavior within these nations. The third external factors perceived to be the precipitant of Islamic extremism was the idea of preventing the conversion of young Moslems to Christianity by any ways and means in post-Soviet identity crisis.

AMBITIONS AT WORK: A COMPARISON OF STUDENTS AND EMPLOYEES IN MASCULINE AND FEMININE CONTEXTS

D16. Work and organization – Other

Esther Lopez-Zafra Lopez-Zafra, University of Jaén, Jaén - Spain
Alice H. Eagly, Northwestern University, Evanston - United States

This study analyzed whether female or male students are more ambitious than employed women or men in relation to achieving a higher position in organizational contexts that are congruent versus incongruent with their gender role. The participants were 670 (311 men and 359 women) from two categories (391 students and 391 employees); 206 were studying or working in male-congruent settings and 464 in female-congruent settings. Surveyors asked students and employees to voluntarily participate in this study. Participants received a questionnaire in which they were asked to imagine how they would react to a promotion to a leadership position in their organization (for the employees) or a future organization congruent with their field of study (for students). Then they answered questions about their beliefs about the consequences of the promotion, their core self-evaluations that would result from the promotion, positive and negative emotions the promotion would cause, and their gender role ideology. Results showed that individuals in masculine contexts were significantly more ambitious than individuals in feminine contexts, regardless of their sex or status. However, students thought that consequences were more positive than the employed women and men did. Furthermore, women (both students and employees) in congruent contexts had a more positive self-evaluation than women in incongruent contexts, but men had a higher self-concept than women, regardless gender of context. Key Words. Ambition, gender ideology, men, gender role-congruency, students vs employees, women.
THE EFFECT OF EDUCATION ON THE ATTITUDE OF MULTIETHNIC POPULATION IN GOLESTAN PROVINCE, IRAN

Ghorbanali Ganji Jamehshoorani, Islamic Azad University, Azadshahr – Iran

Golestan Province on the coast of Caspian Sea in Iran holds a multiethnic population. So, one of the major objectives in this research was to assess the effect of education on the held attitude of the members of each ethnic group toward the members of other ethnicities. To achieve this objective, the attitude of each ethnic group on four dimensions of economic, politics, culture and social interaction with other ethnic groups was obtained through a questionnaire. T-test technique was employed to compare the attitude of two independent groups: Illiterate and literate, lower and higher educated groups. Inferential statistical data indicates that education has an inverse effect on the favorable attitude held by the individual in each ethnic group toward other ethnicities. Firstly, illiterate individuals in each ethnic group has more favorable attitude than literate ones in accepting and showing inclination to have interaction across ethnic lines. Secondly, lower educated people in each ethnic group inclined more than higher level educated ones in accepting and having interaction with other ethnic groups. The difference of attitude between illiterate and literate, and also between lower and higher educated people in each ethnic groups towered other ethnic groups, are statistically significant at p<.05. Hence, the general conclusion that could be drawn is that the increase in individual education leads to an increase in his negative attitude toward other groups. The widely held accepted view that widespread education is one of the major prerequisite for cultural pluralism seems no to be holding true, at least, in multiethnic population of Golestan Province, Iran.

RELATIONSHIP BETWEEN RELIGIOUS ATTITUDES AND DEPRESSION

A16. General issues and basic processes - Other

Mohammad Mehdi Naderi, Islamic Azad University, Azadshahr – Iran

Religious attitudes have influences on mental health. The main aim of the present study is to investigate the relationship between religious attitudes and depression. The statistical sample of the study is 129 students of Islamic university of Azadshahr which are selected based on random sampling. Subjects are asked to fill out the Beck’s Depression Inventory (1978) and Religious Attitude Questionnaire (Serahzade, 1987). Pearson Correlation Coefficient and Multiple Factor Regression are used to analyze the research hypothesis. The findings of the study suggest that there exists significant relationship between depression and religious attitudes. Furthermore, religious attitudes can explain the depression variance significantly.
O23
WOMEN’S WORK AND ORGANIZATIONAL CULTURE IN THE PHILIPPINES

D12. Work and organization - Safety culture and climate

Jinky Leilanie Lu, University of the Philippines, Manila - Philippines

This study examined the association between labour intensification due to work intensification and work extensification and ill health in women in certain manufacturing work in the Philippines. Work intensification is defined as more workload for each worker, and work extensification as less deadtime or work rest and more overtime. The sample was 23 establishments and 630 respondents. Workplace environment monitoring showed exposure to hazards such as noise, chemicals, poor ventilation, and poor illumination. The most prevalent illnesses and health problems were headache and coughs and colds. Results of focus group discussions showed adverse work conditions, hazard exposures among women workers, fast pace of work, close supervision, and prevalent occupational illnesses. The results indicate that the health issues of women workers depend on many factors, such as management and supervisory style, job autonomy, nature of task, and hazard exposures.
O24
WOMEN SAFETY CULTURE IN MANUFACTURING WORK

D12. Work and organization - Safety culture and climate

Jinky Leilanie Lu, University of the Philippines, Manila - Philippines

In the light of global industrialization, much attention has been focused on occupational factors and their influence on the health and welfare of workers. This was a cross sectional study using stratified sampling technique based on industry sizes. The study sampled 24 industries, 6 were small scale industries and 9 each for medium and large scale industries. Among the 500 respondents, majority were female (88.8%), single (69.6%) and worked in the production or assembly-line station (87.4%). For females, the most prevalent hazards were exertion involving back (76.2%), excessive work (69.3%), heat (66.9%), poor ventilation (56.6%), and chemical exposure (52.4%). Sickness absenteeism was relative high among the workers in this study accounting for almost 54% among females and 48% among males. Many of the workers also reported of poor performance at work, boredom, tardiness and absenteeism. From the data generated, important issues that must be dealt with in work organizations include the quality of work life, and health and safety issues. Based on these findings, we can conclude that there are still issues on occupational health and safety (OHS) in the target site of export processing zones in the Philippines. There must be an active campaign for OHS in industries that are produce for the global market such as the target industries in this study. Keywords: Occupational health and safety, manufacturing industries, export processing zones, organizational factors, quality of worklife
MULTIPLE INTERACTIONS OF HAZARD EXPOSURES, SITUATIONAL FACTORS AND PERSONAL FACTORS ON BURNOUT AMONG NURSES

Jinky Leilanie Lu, University of the Philippines, Manila – Philippines

This was a cross-sectional study, which aimed to determine the interaction between situational factors, role stressors, hazard exposure and personal factors among 246 nurses consisting most of females (78.5%) from the different wards and units in the Philippine General Hospital (PGH). The dominance of female in the profession reinforce the prevailing notion that the caring professions such as nursing are relegated to women. This gives the study its gender perspective. Almost half (49.6%) of the respondents reported being ill due to work in the past year, and 56.1% missed work because of an illness. Correlation statistics using the Spearman’s rho showed organizational role stressors was most significant in burnout among nurses in the Philippine’s largest tertiary hospital. Organizational role stressors consisted of ten dimensions, namely: 1) Inter-role Distance (IRD); 2) Role Stagnation (RS); 3) Role Expectation Conflict (REC); 4) Role Erosion (RE); 5) Role Overload (RO); 6) Role Isolation (RI); 7) Personal Inadequacy (PI); 8) Self-role Distance (SRD); 9) Role Ambiguity; and 10) Resource Inadequacy (RIn). The contribution of the study is in advancing new concepts in the already existing framework of burnout, and thus, can assist nurses and hospital administration on how to control this problem. Keywords: Burnout, Organizational Role Stressors, Hazard Exposures, Situational Factors, Nurses
THE EFFECTIVENESS OF TRAINING SOFTWARE “PROBLEM SOLVING ASSISTANT” ON REINFORCEMENT OF PROBLEM SOLVING OF STUDENTS WITH MATHEMATICS LEARNING DISORDER

Objective: The purpose of the present research was the effectiveness of training software “problem solving assistant” on reinforcement of problem solving of students with mathematics learning disorder. Method: Research method was quasi-experimental with pretest and posttest design with control group. In order to do this research, after of administering of Diagnostic tests (including wechslers intelligence scale for children, Iranian kimat test) thirty girl students with mathematics learning disorder were elected from community of students the fourth and fifth grades of primary school in Qaemshahr city through cluster sampling. Then they randomly divided into two experimental and control groups. the experimental group received training software “problem solving assistant” for 8 sessions but the control group didn't receive any intervention. Data was analyzed through repeated measures analysis of mixed variance. Results: results indicated that between problem-solving scores mean of experimental group and control group have meaningful differences. Conclusion: Based on Results, the training software program improved solving problems in students with mathematics learning disorder. Also this procedures will cause the permanence of the training after duration of three months. It can be recommended that psychologists and learning disorders professionals administer this training software program for the reinforcement of problem solving of students with mathematics learning disorder. Key words: Problem solving assistant software, solving problem, mathematics learning disorder, primary school student.

MINDFULNESSBASED TREATMENT METHODS FOR ADDICTIVE DISORDERS - EVIDENCE-BASED OR FAITH-BASED

F22. EXPO 2015 Hot Topics - Sustainability and mindfulness

Wolfgang Beiglboeck, University of Vienna, Vienna – Austria

Mindfulness came in the focus of interest in Psychology about 25 years ago. Its origins lay in Buddhist meditation techniques where mindfulness plays an important role as a way to the cessation of personal suffering. Therefore it became of interest in the treatment of psychological disorders as a possibility to cope with emotional distress and maladaptive behavior. Nevertheless only during the last few years specialized mindfulness based therapy programs for substance abuse disorders (SUDs) have been developed. Only few of these treatment approaches have a sound theoretical basis and even fewer are evidence-based. Only three of them (Dialectical Behavior Therapy for Substance Abuse, Mindfulness-Oriented Recovery Enhancement for Opioid Misuse - MORE and Mindfulness-based relapse prevention - MBRP) have been investigated by more or less extensive research programs to clarify their therapeutic effectiveness. This presentation will critically discuss if the recently published results of this research legitimates the use of mindfulness based treatment programs as standard care for SUDs. One main restriction of the ongoing research is that all subjects of these efficacy trials have been from English-speaking countries. Therefore the results of a pilot efficacy trial of a German Version of the MBRP will be represented. 30 in-patients and out-patients of a treatment centre for alcohol addicts participated in this 8-week program. Questionnaires comprising Craving, mindfulness, self-management and internal vs. external control were administered in a pre-/post-design. To some extent these measurements could be compared to a control group receiving treatment as usual (TAU). First results show an encouraging increase not only in mindfulness, but also in other relevant therapy factors. Nevertheless there are some restrictions to observe when using mindfulness based approaches in the treatment of SUDs. E.g. there is no or not sufficient research on gender issues and who benefits most of these programs.
Survey evidence has now made clear that no consensus exists among either clinicians or media scholars regarding the impact of violent media on youth. Some evidence with the general public and with clinicians suggests that divergent opinions can be explained as consistent with previous generational struggles over new media such as with comic books and rock music. Namely age, female gender and negative attitudes toward youth all tend to predict greater willingness to believe video game violence is harmful. However, these questions have never been addressed among media scholars themselves. The current research describes a survey study of media scholars examining for factors that influence opinions on video games including age, gender, negative attitudes toward youth as well as two new concepts, sanctimony bias and warning bias. Addressing the sociology of media effects research itself may help understand why some segments of the scientific community continue to make claims about video game effects that are unsupported by data.
O41
GUESSING IN MCQ-BASED ASSESSMENTS

A03. General issues and basic processes – Psychometrics

John Barnard, EPEC Pty Ltd, University of Sydney, Sydney – Australia

This presentation will focus on the scoring of multiple-choice questions (MCQs) as widely used in assessments with a focus on guessing. Classical Test Theory (CTT) is traditionally used to calculate a score based on the number of questions answered correctly. Scores can be adjusted for possible guessing using a form of correction which assumes that guessing is random. In Rasch measurement fit statistics are calculated. Having item difficulty and test taker ability on a common scale, guessing is suspected if a test taker responds correctly to a question of which the difficulty is significantly higher than the test taker’s ability. The three-parameter Item Response Theory (IRT) model includes a pseudo-chance (guessing) parameter which reportedly estimates the probability of a test taker to correctly guess an answer. Whereas the correction for guessing formula in CTT is hard to defend, test takers seldom randomly guess and a guessing parameter value should not be constant, it is argued in Option Probability Theory (OPT) that a guessing parameter should be a person parameter as it is people who guess. In this theory a realism index is calculated to indicate the amount of uncertainty in a test taker’s responses. The test taker assigns percentages to any number of possible answers from which a score and a realism index is calculated.
TOWARD A THEORY OF MONETARY INTELLIGENCE

A growing body of research has explored Monetary Intelligence (MI, money smart). MI examines the relationships between the affective-behavioral-cognitive (ABC) components of money attitudes and theoretically appropriate outcomes. Results of MI offer the following insights. On the dark side, affective love of money motive (Factors Rich, Motivator, and Importance) predicts unethical intentions in multiple panel studies and cheating behaviors in laboratory experiments. Further, money is Power in the context of Materialism. Those who value money as Power and do not Budget their money carefully tend to fall into temptation—worship materialism, impress others, and show off in the social context. On the bright side, in a cross-cultural study involving individuals in 32 geopolitical entities across six continents, money smart managers with negative love of money motive but positive stewardship behavior have high pay satisfaction and life satisfaction. Further, money smart managers adapt the approach coping strategies and enjoy higher intrinsic and extrinsic job satisfaction; whereas money smart students have lower importance in making money, but higher importance in making ethical decisions, and better objective academic achievement (final course grade) in college (predictive validity). Monetary Intelligence demonstrates individuals’ ability to monitor their own emotions, behaviors, and cognitions and use the information to guide their thinking and actions in their everyday lives.

SHORT- AND LONG-TERM COGNITIVE OUTCOMES OF CARDIAC SURGERY

E12. Health and clinical intervention - Cognitive disturbances and rehabilitation

Daria Eremina, Department of psychology, Saint-Petersburg State University, Saint-Petersburg, Russian Federation

Recent researches have shown severe cognitive disorders accompanying cardiac surgery. However, mild cognitive dysfunction, more amenable to prevention and correction, is less studied because of difficulties in diagnosing. Moreover, the underlying mechanism leading to cognitive decline is still unclear. For this reason, we aim at analyzing the dynamics of cognitive functions, dependent on biomedical and psychosocial factors, of patients undergoing cardiac surgery without clinically determined signs of dementia. We also focus on comparing cognitive functioning of patients with the normative data. Examination of 100 patients of average age 57.4 ± 5.2 years (using WAIS, TMT-test, Stroop test, TAS, Benton test, etc.) was effected in three stages: before surgery, 12-14 days after surgery, and 3 months after it. The results obtained demonstrate negative changes in both short- and long-term verbal memory, and also in attention switching after surgery. Possible reasons for postoperative cognitive decline include conditions and consequences of the surgery, normal ageing, and brain injury at the time of coronary surgery. At the same time, positive dynamics in the visual and logical memory, as well as in spatial and verbal-logical thinking, was observed. Upon rehabilitation, the indicators of psychomotor speed, attention switching, and cognitive flexibility, which were reduced as compared to the normative data before surgery, have regained their normal levels 3 months after.

STEREOTYPICAL ATTITUDES AMONGST STUDENTS AT A SOUTH AFRICAN UNIVERSITY

C07. Culture and society - Race and ethnicity
Kathryn Nel, University of Limpopo, Pretoria - South Africa
Cebile Tebele-Mensele, University of South Africa, Pretoria - South Africa
Elizabeth Nel, University of South Africa, Pretoria - South Africa
Larisa Louw, University of South Africa, Pretoria - South Africa

This study investigated race stereotypical behaviour amongst students at a South African University. Participants were African (95%), White (3%), Coloured (1%) and Indian/Asian (1%). Females constituted 62% of the sample and males 38%. The average age of respondents was between 17 – 24 years. Participants completed a racial stereotypes survey which had high internal consistency (Cronbach Alpha .93). The findings indicated that black students from a rural background found that city blacks lacked African culture and were overly westernised. It was also noted that they look down on rural blacks. Rural blacks were stereotypically described as being more respectful, poor and with a greater affinity for African culture. English speaking whites were described as superior, friendly and dominating whilst Afrikaner whites were stereotyped as racist, aggressive, violent and hardworking. Indians were perceived as unethical and deceitful whilst coloureds were noted as being violent and aggressive by blacks and whites of both groups. It is clear that stereotypical racist language or discourse is still widespread in South Africa and underpins students’ perceptions of others. Key words: Stereotypes, race relations, diversity management.
THE EFFECTS OF MESSAGE FRAMING AND TEMPORAL PERSPECTIVE IN PROMOTING HEALTHY EATING HABITS: DIFFERENCES BETWEEN YOUNGER AND OLDER ADULTS

Mauro Bertolotti, Catholic University of Milan, Milan – Italy
Giorgia Chirchiglia, Catholic University of Milan, Milan – Italy
Patrizia Catellani, Catholic University of Milan, Milan – Italy

Research on health communication has been investigating message framing as a persuasive technique to promote healthy behaviours, such as following a balanced diet. Past results, however, showed that emphasizing the positive consequences of healthy eating or, conversely, the negative consequences of unhealthy eating doesn’t directly improve the persuasiveness of health-promoting messages. Other factors can influence the effectiveness of health-promoting messages, such as the focus on health or well-being concerns, the temporal perspective, and recipients’ individual characteristics. In our studies, we investigated the effects of message framing on young and elderly participants. Participants were presented with messages describing the positive vs negative effects of eating habits on health vs well-being, in a long vs short term perspective. Participants’ agreement with the messages and the intention to change their eating behaviour was measured, as well as participants’ levels of self-efficacy, health regulatory focus, and the consideration of future consequences. Results showed that the persuasiveness of positively and negatively framed messages was moderated by the regulatory concern and the temporal perspective of the messages. Participants’ individual characteristics, including age, also moderated these effects. Discussion will focus on which characteristics of persuasive messages and their recipients should be considered when designing effective health communication.

EFFECTIVENESS OF COMPUTER TRAINING PROGRAM IN DEVELOPING THE INTEGRATE BRAIN FUNCTION

A12. General issues and basic processes - Intelligence and cognitive functioning

Fawzy Ezzat Aly Abd Alazem Daw Daw, Suez University, Suez - Egypt

The aim of the study was to verify the effectiveness of a Computer training program in developing the integrate brain functions for preparatory school students. The selected sample were 40 students for the first grade from El-Tal Eilkabir preparatory school in Asmailia governorate-Egypt, means age 12.77 S.D 0.68 the sample were divided into two equal groups, control group 20 students and experimental group 20 students. The Arabic modification of Torrance test of the style of learning and thinking (TTSLT) by Riad & Abd Eilateef (1986) and re-validated by Ibrahim (2011) were pre-administered to the two groups. The Experimental group underwent to a computer training program for 15 sessions through 5 weeks, 3 sessions a week, the duration of every session 45 minutes. The program designed and standardized under the researcher supervision and was reviewed by a committee of ten educational professors. It consisted of some activates representatives the row and simultaneous Brain functions such as, row pictures, Form useful sentence of arrangement words, Linguistic reasoning, Logical reasoning, Aware the relations between simultaneous pictures, also between words, Face recognition, Numerical reasoning, Pictures completion, Visual spatial perception. Post test of (TTSLT) were applied to the two groups, the data were analyzed used t test method between the two groups revealed that there were significant differences in the post (TTSLT) tests in favor of the experimental group at P. 0.01 in the integrate Brain functions. The researcher suggested that this finding sported the effectiveness of the Computer training program, Further Resarches needed to Confirm this Results.

SEEING THE UNSEEN: OPPORTUNITIES TO WORK WITH CHILDREN WHO ARE TRAUMATIZED IN A CARE GIVING RELATIONSHIP

B04. Development and education - Attachment and intimate relationships

Doris D'Hooghe, Traumacentre Belgium, Sint Margriete – Belgium

By presenting a clinical case of an 8 years old boy suffering anxiety, I want to broaden the vision regarding attachment trauma and illustrate a treatment model, based on this expanded view. I want to finger point attachment trauma as adverse experiences, occurring in early childhood, which are repetitive, chronic and between child and caregiver. This expanded vision might serve as a basis for a new classification which has implications for recognition and assessment and enables us to incorporate this in clinical practice, early intervention strategies and treatment. The model is AIP informed and based on neuroscientifically attachment and trauma theory. The model integrates working with the caregiver. Special attention is given to the child-therapist relationship. Research on the consequences of early traumatic events helps us to define new criteria for attachment trauma and enables a more accurate treatment. And finally, a higher awareness of these events enables us to create adequate prevention strategies. By raising awareness among both caregivers and clinician about attachment trauma, prevention strategies and tailor-made treatment might increase and create new therapeutic opportunities.
The current presentation is based on a series of studies conducted during 2009-2015, explored the nature of cyberbullying among youth, its expressions, relationships with psychological variables and youth emotional and behavioral reactions, focusing on cyber victimization. Cyberbullying refers to a deliberate aggressive activity that takes place using electronic technology, aimed at hurting and harassing others through digital communication means (Smith et al., 2008) and is constantly increasing during the last years (Patchin & Hunjuda, 2014). Cyberbullying is characterized by unique features offered by the electronic technology communication, such as: Anonymity, rapid communication, wide accessibility, online disinhibition effect and possibilities to change and locate identify (Law et al., 2012 http://www.sciencedirect.com.elib.openu.ac.il/science/article/pii/ S074756320900185X - bib51). 1132 Israeli adolescents, aged 12-16, completed questionnaires examining their involvement in cyberbullying, specific psychological variables and their emotional and behavioral reactions to cyber victimization. 26% of the participants reported being cyber victims (with a significant increase over the years). Significant correlations were found between cyber victimization and high levels of depressive mood, social and emotional loneliness, low levels of self-efficacy and subjective well-being. The most common emotional reactions were rage and anxiety, while the least common were loss of appetite and sleeping difficulties. Common behavioral reactions were assaulting back and sharing with close friends, but not with parents. Almost no one of the cyber victims disconnect the network. Possibilities for intervention programs integrating psychology and technology aspects will be discussed.
O93
DEVELOPMENT OF EMPATHY SCALE FOR HUMAN CARING BEHAVIOR: INVESTIGATION ON RELEVANCE BETWEEN RESILIENCE AND HOSPITALITY

F19. EXPO 2015 Hot Topics - Life skills in culture and society

Kazuki Nishiura, Miyagi Gakuin Women's University, Sendai – Japan
Kazuhiro Ikeda, Shokei Gakuin University, Sendai – Japan
Jun Tayama, Nagasaki University, Nagasaki – Japan

The purpose of this research was to develop empathy scale for human caring behavior, and to provide fundamental evidence of spontaneous recovery of mental strength, which enables it to endure work stress for human caring. Concretely speaking, we conducted investigation of 624 undergraduate students (300 general undergraduate students and 324 childcare students) with the resilience scale (RS-14), in addition to the hospitality scale that was developed by Nishiura et al. (2008). As a result, we found that the childcare students in the 4th grade had significantly-higher hospitality than the general students, and that the childcare students in the 1st grade and the 4th grade have significantly-higher resilience than the general students. Furthermore, we confirmed that the sample of all the subjects was divided into 3 groups with cluster analysis. The major findings of the study suggested that higher resilience students would show higher hospitality, but lower resilience students would tend to be self-centered, and could not change their empathy into human caring behaviors in the hospitality. Keywords: Empathy, Hospitality, Resilience, Emotional Labor, Human Caring
DESIGNING AND TESTING A MODEL OF SOME PERSONAL, JOB RELATED, AND ORGANIZATIONAL VARIABLES AS ANTECEDENTS OF THE ORGANIZATIONAL WELL-BEING

The purpose of this study was designing and testing a model of some personal, job related, and organizational variables as antecedents of the organizational well-being in employees of National Iranian South Oil Company (NISOC). The statistical population of the present research included all the employees of National Iranian South Oil Company (NISOC). 450 employees were selected by relative stage sampling method. Instruments used in the present study were Personally Expressive Activities Questionnaire (PEAQ), Psychological Capital Questionnaire (PCQ), Servant Leadership Survey (SLS), Organizational Ethical Climate Questionnaire (OECQ), Job Stress Questionnaire (JSQ), Basic Psychological Needs at Work Scale (BPNWS), and Job Content Questionnaire (JCQ). Structural equation modeling (SEM) through AMOS-18 software package was used for data analysis. Results showed that the proposed model fit the data properly. Moreover, direct positive relationships of the psychological capital, basic psychological needs, job characteristics, servant leadership, organizational ethical climate, and the direct negative relationship of job stress with organizational well-being were confirmed. Bootstrap procedure for testing indirect effect revealed that organizational ethical climate mediated the relationship between servant leadership and organizational well being.
O98
THE RELATIONSHIP BETWEEN PORNOGRAPHY CONSUMPTION AND SEXUAL SATISFACTION BASED ON THE THEORY OF PLANNED BEHAVIOR

A01. General issues and basic processes - History of psychology

Esra Inciler, Middle East Technical University, Ankara – Turkey

With expansion of internet usage, pornography becomes a very hot and risky topic about last few decades. Pornography consumption is so sensitive and personal behavior, for this reason individuals generally do not want to talk about it or frequency of pornography watching or choices about pornography. Some people are more tolerated about sexual content in the internet, some other more conservative. On the other hand, there are so many videos or images about explicit content; and everyone can face them almost any time. The aim of this study was to explain relationships between pornography consumption behavior and sexual satisfaction and pornography usage’s main psychosocial factors based on Theory of Planned Behavior. 430 participants were attended to the study and they filled Demographic Form, Theory of Planned Behavior Questionnaire about Pornography Consumption, and Kece’s Sexual Satisfaction Scale. Intention, perceived partner behavior control, and attitude significantly predict pornography consumption.
The vast majority of psychotherapy research focuses on problems and symptoms of those who seek counseling and therapy. The psychological difficulties that mental health professionals might experience, however, have largely been disregarded. This is especially the case in Turkey. This study therefore focused on investigating psychiatric profiles of mental health professionals in Turkey. A sample of 245 professionals including psychologists, psychiatrists, psychological counselors, social workers and other mental health professionals participated in the study. The study was carried out in a survey format, which included questions regarding demographic and professional information as well as psychological problems the participants might be experiencing. Psychiatric symptom level was measured via Brief Symptom Inventory (BSI; Derogatis & Spencer, 1982). Turkish version of BSI reveals five major symptom clusters: Anxiety, Depression, Negative Self, Somatization, and Hostility. The public link of the survey, together with an introductory statement about the content and purpose of the study, was sent to major email groups joined by mental health professionals in Turkey. The survey was also converted into a Word format, printed and distributed to major hospitals and counseling and psychotherapy clinics in Istanbul, the most populated city of Turkey where the majority of mental health workers reside. Participation in the study was based on voluntarism. Mean score of the sample for all five BSI subscale scores were significantly lower than expected means, suggesting that psychiatric symptomatology of the sample is significantly lower than the normal population. Further analyses revealed significant intercorrelations between BSI subscale scores and certain personal and professional variables. These variables include gender, age, university degree (having a B.A., M.A., or Ph.D. degree), clinical supervision, years of clinical experience, total amount of training received in the field, and theoretical orientation. Despite its limitations, the results of this study are important in terms of presenting an overall psychological profile of mental health workers. At the end of the presentation, the findings and their implications will be discussed with respect to both clinicians and those who receive their services.
O105
AN EYE TRACKING EXPERIMENT INTO THE DIVISION OF ATTENTION BETWEEN TEXTUAL INFORMATION AND CAUSAL DIAGRAMS IN ACADEMIC TEXTS

B03. Development and education - Learning and instruction

Sara Verbrugge, University of Leuven, Leuven – Belgium
Bert Goossens, University of Leuven, Leuven - Belgium

Which contributions do diagrams, causal relations and prior knowledge make to scientific texts used for students in academic environments? To answer this question, we set up an experiment with 24 students. They took part in an eyetracking experiment in which they read a text that matched their prior knowledge or did not. Causal diagrams, which summarized the relations in the text by means of bullets and arrows, were added. Text and causal diagrams were presented simultaneously on a computer screen. The number of causal relations was also varied (many-few). Results showed that the text containing more causal relations was better retained by participants than the text containing fewer causal relations F(1, 20)=39.31, p<.0001, irrespective of prior knowledge. However, a main effect of prior knowledge could also be observed F(1, 20)=12.60, p<.01, texts that matched participants’ prior knowledge were better retained. We also checked the eyetracking patterns of participants. For the text containing many causal relations, no correlations could be found between overall scores and division of attention between textual information and diagrams. However, for the text containing fewer causal relations, the more students integrated between text and diagram, the better their memory of the text (correlation 0.63). See Mason et al. (2013) for similar results. Our findings hints towards the need to elucidate course material lacking in causality, with diagrams in order to boost memory.
O108
EYEWITNESS MEMORY FOR VERBAL AND VISUAL ACTIONS AND DETAILS IN YOUNGER AND OLDER ADULTS

A09. General issues and basic processes - Learning and memory

Alaitz Aizpurua, University of the Basque Country, Donostia-San Sebastian – Spain
Elvira Garcia-Bajos, University of the Basque Country, Donostia-San Sebastian – Spain
Malen Migueles, University of the Basque Country, Donostia-San Sebastian – Spain

Life expectancy has increased and so the likelihood that elderly people is called to testify. Although there are no notable differences between young and older adults in recalling generic knowledge or the sequence of the actions of the event, older adults have difficulty remembering specific information that requires attentional/cognitive resources. To examine whether different cognitive mechanisms are involved in processing generic/conceptual or detailed/perceptual information, in this study we distinguished between actions and details and between verbal and visual information of a bank robbery. Participants completed a recall (closed-questions) or a recognition (true/false) task and rated their confidence in their answers. Performance was better in recall than in recognition, for actions than details and for visual than verbal information. Relative to younger adults, older adults had more errors and showed higher confidence in their false memories; their confidence ratings were similar in all contents, whereas younger adults showed higher confidence for actions than details and for visual than verbal information. Errors characterized verbal actions and visual details. These findings suggest that in eyewitness situations, complementary cognitive mechanisms are involved in processing conceptual and perceptual information of the event, and provide guidelines for detecting errors and for improving eyewitness questioning, in particular when the one testifying is an older adult.
A CROSS-CULTURAL STUDY: SYSTEMATIC ASSOCIATION BETWEEN GENDER-RELATED OCCUPATIONAL DIFFERENCES AND NATIONAL CULTURE DIMENSIONS

C10. Culture and society - Economic choices

Fatih Ozdemir, Middle East Technical University, Ankara - Turkey
Hilal Terzi, Middle East Technical University, Ankara – Turkey

The purpose of the study was to predict gender-related occupational differences with Hofstede's national culture dimensions (including power distance, individualism, masculinity, uncertainty avoidance, pragmatism and indulgence). According to 2012 International Labour Organization (ILO) report, projected worldwide gender gap in labor force participation was 26%, and this gap reached to 50% in South Asia, Middle East and North Africa regions. Women are underrepresented at occupational areas over the world, and the level of underrepresentation may be related with culture. In present study, 2006-2013 ILO statistics and World Bank data (including the ratio of man and woman in agriculture, industry, service, labor force, national parliament, legislative positions and vulnerable employment) was tested with Hofstede's national culture data which was collected from 73 different countries. Analyses were conducted in country level. Canonical correlation analysis indicated a systematic association between gender-related occupational differences and national culture dimensions. Moreover, when gross national income per capita of each country was controlled, cultural values significantly predicted the position of man and women in different occupational categories.
Intimate partner violence (IPV) constitutes a serious and prevalent social problem (Garcia-Moreno, Jansen, Ellsberg, Heise, & Watts, 2006) that has traditionally been treated as a gender-related issue or as one aspect of the larger issue of family violence (Lawson, 2012). However, IPV has not been framed within the recent advances of moral psychology. In this respect, it has been observed that feeling too moral give people credentials to behave immorally (Merritt, Effron, & Monin, 2010). Furthermore, the more people sacralize a moral foundation, the more they are willing to fight for it (Graham & Haidt, 2012). Because such results are drawn from Western, educated, industrialized, rich, and democratic samples of college students (Henrich, Heine, & Norenzayan, 2010), it would be interesting to study whether men convicted of domestic violence, who manifestly have perform behaviors judged as wrong in most social systems, may also be affected by such moral paradoxes. From a comparative perspective, we present a characterization of men in a court-mandated treatment for violence against their partners as holding a sacred vision of the five moral foundations (Graham, Nosek, Haidt, Iyer, Koleva, & Ditto, 2011) and of their moral self-conception (Allison, Messick, & Goethals, 1989). This characterization is compatible with the assumption that a sacred moral world is easily threatened by reality, which may be associated with violent defensive reactions, and allow us to add new relevant variables to psychological treatments.
O117
THE INFLUENCE OF RELATIONSHIP STATUS, PERPETRATOR-VICTIM SEX AND Sexting EXPERIENCE ON PERCEPTIONS OF “REVENGE PORN”

C11. Culture and society - Forensic psychology and law

Jeff Gavin, University of Bath, Bath - United Kingdom
Adrian J Scott, Edith Cowan University, Perth - Australia

Revenge porn is the practice of disclosing intimate images of a former romantic partner without their consent. It is typically predicated on the victim sexting these images to the perpetrator. Though prevalent for both sexes, sexting is a gendered phenomenon, with the perceived risks and repercussions different for men and women. Drawing on research on other forms of intimate aggression, this study used a $2 \times 2 \times 2$ independent measures design to investigate the influence of relationship status, perpetrator-victim sex, and sexting experience on perceptions of revenge porn among university students. Students ($n=250$) were presented with a vignette and asked to respond to items concerning the situation described, as well as items concerning the taking, sending and receiving of intimate images. Approximately 50% of participants reported taking intimate images and sending them to romantic partners, and a further 17% reported sending them to prospective partners. The victim was perceived to be more responsible for the situation if the intimate images were taken in the context of a casual rather than a committed relationship. The situation was perceived to be more serious when the perpetrator was a man and the victim was a woman, and participants who did not have sexting experience were more likely to perceive the situation to be serious than participants who had sexting experience. Implications for victim support and prevention advice are considered.
O123
WHAT AFFECTS PSYCHOLOGICAL RESILIENCE IN EARTHQUAKE SURVIVORS FROM VAN, TURKEY?

E14. Health and clinical intervention - Disaster and crisis psychology

Gözde Ikizer, Middle East Technical University, Ankara - Turkey
Karancı Ayse Nuray, Middle East Technical University, Ankara – Turkey
Canay Doğulu, Middle East Technical University, Ankara – Turkey

Natural disasters may result in considerable losses and disruptions, inevitably affecting many people. Therefore, facilitating the ability of individuals to adapt after disasters is an important need. However, there is limited knowledge regarding the resilience capacity of individuals confronted with disasters. The study aimed to understand factors associated with psychological resilience in the aftermath of two destructive earthquakes which struck Van, Turkey in 2011. 360 survivors participated in the study. Quota sampling procedures were utilized to reach participants having different levels of earthquake damage. Instruments assessing socio-demography, personality, social capital, severity of exposure, disaster-related attributions, and coping styles were delivered to participants along with the Connor-Davidson Resilience Scale. The analysis revealed that among pre-disaster variables, education, mental health, extraversion, satisfaction with life, and structural social capital were positively associated with psychological resilience. Furthermore, severity of exposure and coping self-efficacy and problem-solving coping predicted psychological resilience among the within- and post-disaster variables. The results provide empirical evidence for the importance of a wide range of factors that facilitate psychological resilience in disaster context. The recognition of these factors may help to plan, to develop, and to apply psychosocial interventions for disaster survivors.
HOW DO CLINICIANS MAKE SENSE OF CHANGE? AN INTERPRETATIVE PHENOMENOLOGICAL ANALYSIS OF MULTIPLE FAMILY THERAPY FOR ANOREXIA NERVOSA

Zoé Gelin, University of Mons, Mons – Belgium

Multiple Family Therapy (MFT) is an outpatient therapy, bringing together several families affected by the same pathology, which has gained an established position in the treatment of several mental conditions over the past decades. Our research seeks to clarify the therapeutic process from the clinician’s perspectives, with the aim to clarify change mechanisms involved in this therapeutic setting described as a “hybrid” between family and group therapy. Our objective is to contribute to the development of a better-defined identity for MFT through the examination of the subjective experience of clinicians. A qualitative and inductive method was chosen in order to emphasise the effective components within therapy interventions. Six experienced MFT clinicians were interviewed using Interpretative Phenomenological Analysis. Three master themes were identified as potential therapeutic factors: (1) predefined therapeutic model, (2) transmission process and (3) focus on the group. In particular, the process of differentiation within the security of the affiliation to the group « teaches » the family that individuation of family members enhances its identity rather than destroys it. While MFT seems to be strongly influenced by integrative research focused on common factors, the dialectical dynamic between affiliation and differentiation within the group, operating as a mirror for the family may constitute a specific mechanism of change involved in MFT.
O131
DO THE GROUPS WE BELONG TO PREDICT HOW WE ACT? THE EFFECT OF SOCIAL IDENTITY ON HEALTH RELATED BEHAVIOR

E11. Health and clinical intervention - Lifestyles and healthy self-regulation

Natascha de Hoog, Open University of the Netherlands, Heerlen – Netherlands

Belonging to certain groups (supporters, smokers, elderly) can have positive or negative consequences for health related behavior. How much influence group membership has depends on one’s social identity. Social identity is the part of identity derived from the groups people belong to. Especially degree of identification with a group can influence health related behavior. Even though research has shown social identity can influence health related behavior, not much is known about the underlying mechanisms. In 3studies the relationship between social identity and health related behavior and a number of moderators were examined. Study 1 showed a positive effect of smoker identity on smoking behavior. Smoker identity was also positively related to susceptibility and negatively related to self-efficacy. Study 2 revealed a positive effect of active elderly identification on physical activity. Both factors were also positively related to self-esteem, well-being and negatively to loneliness. Study 3 showed a negative effect of subjective Social Economic Status (SES) on a range of unhealthy behaviors, especially when people saw those behaviors as typical for low SES. Results show the importance of social identification in health related behavior, especially degree of identification and perceiving certain behaviors as part of the ingroup. Future research should focus on how social identification can be incorporated into health interventions.
O132
EFFECTS OF RELAXATION INTERVENTIONS ON DEPRESSION AND ANXIETY AMONG OLDER ADULTS: A META-ANALYSIS

E05. Health and clinical intervention - Evidence based psychotherapies

Piyanee Klainin-Yobas, National University of Singapore, Singapore – Singapore
Win Nuang Oo, National University of Singapore, Singapore – Singapore
Pay Ying Suzanne Yew, National University of Singapore, Singapore – Singapore
Ying Lau, National University of Singapore, Singapore – Singapore

This meta-analysis examined empirical evidence of the effects of relaxation interventions on anxiety and depression among older adults. A comprehensive literature search identified studies that satisfied the pre-set inclusion and exclusion criteria. We focused on 19 published and non-published studies undertaken in the past 20 years (1994–2014). Three reviewers selected studies, extracted data and appraised the methodological quality. We then computed Cohen’s effect sizes and used these to represent the effects of intervention. Our findings suggested that older adults who received relaxation interventions experienced a greater reduction in depression and anxiety than controls in most studies. Progressive muscle relaxation training (PMRT), music therapy, audio-based cognitive therapy (ABCT) and yoga had the strongest intervention effects on depression. Music therapy, yoga, mind/body wellness and PMRT most effectively reduced anxiety symptoms among older adults. Furthermore, the impact of some relaxation interventions remained in effect for between 14 and 24 weeks after the intervention was delivered. This meta-analysis supported the positive effects of relaxation interventions on depression and anxiety among older adults. Healthcare providers may integrate relaxation interventions into standard care for older adults in community and hospital settings, taking into consideration the participant’s preference and healthcare policy. Keywords: Anxiety, Depression, Relaxation Intervention, Meta-analysis
O133
THE SIGNIFICANCE OF INDIVIDUAL VALUES AND DESTINATION PERSONALITY FOR TRAVEL BEHAVIOUR

C16. Culture and society – Other

Tamara Jovanovic, University of Novi Sad, Novi Sad – Serbia
Nebojša Majstorović, University of Novi Sad, Novi Sad - Serbia

Why tourists like and why they choose to visit certain types of destinations are some of the key questions for the tourism industry. This study has examined the effects of tourists’ individual values and their perception of destination “personality” on their destination preferences. Research was conducted on the heterogeneous sample of Serbian tourists (N=766) visiting three holiday destinations: seaside, mountain and city. Questionnaire consisted of socio-demographic variables (gender, age, education and marital status), Schwartz Scale of Universal Human Values (Schwartz, 1992), Brand Personality Scale (Aaker, 1997), preference measures for three types of destinations and holiday satisfaction measures. Results of structural equation modelling indicated that individual values, destination personality traits and socio-demographic variables significantly predict tourists’ destination preferences. Out of 11 universal values, hedonism, universalism and power significantly influenced tourists’ holiday preferences. It was also found that perceived sincerity and excitement, as two destination personality features, influence holiday preference directly, as well as, indirectly through satisfaction with the holiday. It was concluded that destination preferences of Serbian tourists are affected by their values and perception of the destination personality and, even more, by limitations that come from their socio-demographic status.

Correlates of personal values were analyzed using data from a cross-cultural study of intimate relationships that is online in multiple languages at http://web.whittier.edu/chill/ir. Participants were recruited in countries in North America (United States, Canada, Mexico), South America (Argentina, Brazil, Colombia), and Europe (Germany, Greece, Hungary, Italy, Romania, Spain), plus others responded from additional countries. Among the 4033 respondents in these analyses, 79% were women, and 66% described a current relationship. Factor analysis of Schwartz PVQ-21 items revealed four high order values found in previous research: Conservatism, Self-Enhancement, Openness to Change, and Self-Transcendence. For both sexes: Conservatism was positively correlated with identification with mainstream culture, church attendance, and belief in God; Self-Enhancement was positively correlated with making money as a goal in life, and trying to impose one's way on the partner; and Openness to Change was positively correlated with having higher self-esteem and saying life is meaningful. Self-Transcendence was positively correlated with having emotionally closer and more fulfilling relationships, but only for men. The lack of other correlations with relationship measures suggests that the dynamics of intimate relationships vary little due to differences in personal values.
According to the laws of sympathetic magic (Frazer, 1925; Rozin, Millman, & Nemeroff, 1986), material objects that resemble a partner (the law of similarity) or were in contact with him/her (the law of contagion) are perceived as if imbued with this person’s “essence”. Consequently, photographs, clothes or gifts from a loved one are treated like the person that they symbolize. It has been proposed that a psychological function of this process, called romantic magical thinking (RMT), is regulation of perceived closeness to a partner (Niemyjska, 2014). Accordingly, I provide empirical evidence showing that separation from a partner, either experimentally manipulated (Study 1) or observed in imprisoned women (Study 2) was related to increased tendency to display RMT. Study 3 confirmed that anxious attachment, characterized by a strong need for partner’s attention and closeness, predicted increased levels of RMT, whereas avoidant attachment, defined by a strong need to distance oneself from a partner, predicted decreased RMT. Moreover, dispositional tendency to employ RMT was related to ascribe greater value to idiographically defined material possessions that were participants’ keepsakes and gifts from their partners, families and friends. Adaptive and disadaptive consequences of RMT are being discussed.
Early Adolescence as a Sensitive Time Window for Social Stress to Cause Long-Term Alterations in Behavior and BDNF Expression

Weiwen Wang, Institute of Psychology, Chinese Academy of Sciences, Beijing - China
San-na Yuan, Institute of Psychology, Chinese Academy of Sciences, Beijing - China
Fan Zhang, Institute of Psychology, Chinese Academy of Sciences, Beijing - China
Wenjuan Lin, Institute of Psychology, Chinese Academy of Sciences, Beijing - China

Social stress in adolescence is correlated with emergence of psychopathologies during adulthood. However, how social stress specifically impacts adolescent behavior and brain function and its relationship with adult psychopathologies remain unclear. This study included two experiments. In Exp1, we investigate the short- and long-term (24h and 6w after stress) effects of social defeat stress (SDS) on exploratory behavior, social interaction and cortically-mediated cognitive function in attentional set-shifting task in early adolescent (PND 28-37, EA), late adolescent (PND 38-47, LA), and adult (PND 70-79, ADULT) mice. Adults experiencing SDS during EA, but not LA and ADULT exhibited behavioral deficits in both defeated-related social memory and extra-dimensional set-shifting. In Exp2, we further examined adult alterations in behavior and BDNF expression induced by EA SDS and the effects of antidepressant duloxetine treatment. Besides behavioral consequences as shown in Exp1, EA SDS also differentially affected adult BDNF levels in different regions, causing decreased BDNF in medial prefrontal cortex and increased BDNF in hippocampus. Moreover, 14d duloxetine treatment reversed above behavioral and molecular alterations. These results suggested EA might be a sensitive “time window” during which SDS persistently affected context-related memory and cortically cognitive function, which might be involved in the increased risk for psychiatric disorders during adulthood.

INFLUENCES OF GENDER, POLITICAL AND RELIGIOUS ORIENTATION ON INTUITION BASED MORAL DECISION MAKING PROCESS

C12. Culture and society - Political preferences and behavior

Beyza Tepe, Ahçeşehir University, Bahçeşehir University, Istanbul - Turkey
Zeynep Ecem Piyale, Ahçeşehir University, Bahçeşehir University, Istanbul - Turkey
Selçuk Şirin, New York University, New York - United States

Intuitive approach of Jonathan Haidt (2013) constitutes the main theoretical framework for the current study which attempts to explore the influences of gender, political attitude and religious orientation on moral decision making process. Unlike the traditional morality approach based on cognitive perspective by Kohlberg and Piaget, Haidt highlights the influences of human’s intuitions on moral decision making process. Specifically Haidt argues that intuition comes first and finding reason comes second in the form of rationalization mechanism. Furthermore he argues that moral decision making is strongly associated with religious orientation and gender which in turn influence one’s political orientation. Haidt proposed six foundations of morality all of which is related to political attitudes which again put the emphasis on the importance of intuitions on decision making process. These moral foundations are, care-harm, liberty-oppression, fairness-cheating, loyalty—betrayal, authority—subversion, sanctity—degradation. Each of these foundations play a role in the moral decision making process which is associated with individual’s political orientations. Haidt (2012) stated that Republicans and Democrats are differentiated between each other in terms of their moral foundations. Liberal and Democrats had showed a tendency to care-harm, liberty-oppression and fairness-cheating foundations on their evaluation and decision making process. However, Republicans had leaned equally to each of these six moral foundations. According to that background knowledge, the relationship between political orientations and moral decision making process will be a kind of interesting study in Turkey. Haidt and his colleagues’ (2013) developed harmless taboo violation stories to test cultural validity of his theory which trigger the participant’s intuitions that overcome the irrationalization. The current study is a replication of Haidt’s original study in Turkey. Specifically, we interviewed 167 individuals between the ages of 18 - 30 years old using the same procedures outlined by Haidt. In addition to the taboo scenarios, we also used two self-report surveys to estimate the relation between moral reasoning and political ideology and spiritual beliefs. Political ideology is assessed via the Right-wing authoritarianism scale adopted to Turkey by Güldü (2011). Participant’s spiritual beliefs were assess by the Spiritual Transcendence Scale developed by Seidlitzand his colleagues (2002) which is translated and back translated by researchers. The study tests basically the following three hypotheses. (1)Higher score in right-wing scale and religious attitudes is positively related with moralizing stance but being more spiritual is expected to be positively related with permissive stance. (2) Having higher spiritual tendency is positively related with bothering scores. (3) Higher score in rightwing authoritarian scale is expected to be associated with the higher scores of punishment attitude in the stories and their rightwing authoritarian score. Hypothesis 1 and 3 were confirmed however hypothesis 2 was rejected. One of the interesting results of the current study was that our samples showed tendency towards the concepts of divinity which was not found in the original study with American and Brazilian sample. No significant relationship was found between gender and moral decision making as it was similar with the original study. Participants who got higher scores from the rightwing authoritarian, spiritual and religious scales demonstrated more retributive attitude and moralizing stance towards the actors of harmless taboo violation scenarios. According to Pearson correlation results, religious orientation is significantly correlated with aggressive rightwing authoritarianism (r = .33, p .000), conventional rightwing authoritarianism (r= .55, p .000) and spiritual tendencies (r = .71, p .000). Another interesting finding was that even though our participants identified themselves in leftwing and nonreligious they reacted conservatively. This finding was interpreted as such due to the relationship between referents of ethic of divinity and conservatism as it is
highlighted by the body of literature (Inbar, Pizarro&Bloom, 2008). Further results and more detailed analysis will be discussed at the presentation. Keywords: intuition, moral decision making, rationalization, moral dumbfounding, decision making process.
The aim of the present study was to examine differences of the ways of handling school bullying incidences between teachers with and without workplace victimizations experiences, taking into consideration the measurement of self-report frequency of workplace victimization in school context by using the Negative Acts Questionnaire (Einarsen & Raknes, 1997). Teachers’ workplace victimization was reported by 16% (n=44) and nonvictimization by 84% (n=230) from a multi-stage cluster sample according to the criteria proposed by Mikkelsen and Einarsen (2001). A sample of 276 teachers (mean age=41.09 years; SD=8.14) completed survey asking how often they use different strategies (class management strategies; discussions with the bully and the victim; ignoring bullying; inclusion of other adults; punishing the bully) to respond bullying incidents between pupils. Teachers with and without workplace victimization experiences differed on three of the five scale scores: (1) teachers with workplace victimization experiences more often ignored bullying incidences and used punishment of bullies, and (2) teachers without workplace bullying experiences used more often constructive discussions with bullies and victims. Factors related with teachers’ ways of handling school bullying incidents may by relate not only with their personal characteristics and school-level variables, but also with teachers’ experiences of being victims or non-victims of workplace bullying.
Reinforcement sensitivity theory (RST, Gray, 1970) proposes three neuropsychological systems accounting for two fundamental types of behaviour: approach and avoidance. Approach behaviour is explained by the behavioral activation system (BAS) which provides the neural substrate for impulsivity. Avoidance behavior is clarified by two systems: the behavioral inhibitions system (BIS) which relates to avoidance of conditioned aversive stimuli and provides the neural substrate for anxiety; and the fight-flight-freeze system (FFFS) which relates to avoidance of unconditioned aversive stimuli and provides the neural substrate for fear. RST has been revised into the revised reinforcement sensitivity theory (rRST) where a clearer distinction is made between BIS and FFFS. Research suggests that the overactivity of these systems underlies the etiology of proactive and reactive aggression. Dominance in approach behaviour increases the risk of proactive aggression, while dominance in avoidance behaviour increases the risk of reactive aggression. While no study has examined rRST in explaining proactive and reactive aggression, the aim of this study is to compare RST and rRST in authorizing those subtypes of aggression. Measures of aggression, BAS, BIS, and FFFS were obtained on adolescents (N=81). Regressional and correlational analyses were applied. Ethical principles were respected. The results show no differences between RST and rRST in explaining proactive and reactive aggression.

AN INVESTIGATION ON ENTREPRENEURIAL KNOWLEDGE STRUCTURES: THE ROLE OF UNIVERSITY STUDENTS BACKGROUND

D02. Work and organization - Leadership and entrepreneurship

Michela Loi, University of Cagliari, Cagliari - Italy
Marco Cogoni, Centro di ricerca e sviluppo e studi superiori della Sardegna, Pula – Italy
Maria Chiara Di Guardo, University of Cagliari, Cagliari – Italy

This research investigates entrepreneurs' and students' knowledge structures with regard to the entrepreneurship knowledge domain. The exploratory purposes, resting on the entrepreneurial cognition perspective, are to elucidate the network characteristics defining each groups' representations and to investigate whether and which differences emerge between students' and entrepreneurs' knowledge structures. 18 concepts were extrapolated through a two-stage procedure, firstly based on a literature review aiming to extrapolate the most frequent concepts associated to entrepreneurship and, finally, on a focus-group with entrepreneurs and students to select the final list, which follows: Experience, Intuition, Planning, Change events, Self-efficacy, Risk, Earn, Personal success, Passion, Autonomy, Power, Market, Innovation, Funds, Failure, Friends entrepreneurs, Entrepreneur, Regional context. According to pairwise association methods, participants were asked to indicate the level of correlation between each pair of concepts in a 5 point-scale (1= not connected; 5= strongly connected). The Pathfinder algorithm was used to simplify the structure of individuals' representations and an ad-hoc Python software was developed to (1) visualize individual representations; (2) to measures concepts centrality. Results rest on a sample of 29 entrepreneurs and 165 university students and show that the network differences between entrepreneurs and students increase depending on students' training background.

DISPOSITIONAL GRATITUDE IS POSITIVELY ASSOCIATED WITH SUBJECTIVE WELL-BEING: A LONGITUDINAL STUDY

C06. Culture and society - Attitudes and values

Lilian Jans-Beken, Open University of the Netherlands, Heerlen - Netherlands
Johan Lataster, Open University of the Netherlands, Heerlen - Netherlands
Roeslan Leontjevas, Open University of the Netherlands, Heerlen - Netherlands
Nele Jacobs, Open University of the Netherlands, Heerlen - Netherlands

My contribution will present data on dispositional gratitude associated with measures of subjective well-being. Gratitude received some attention in the research literature but empirical studies on gratitude as an attitude remain sparse compared to other constructs such as resilience and subjective well-being. In a longitudinal research design, 440 adults (M = 46, SD = 14, Range = 18 - 80) completed Dutch versions of the Short Gratitude, Resentment, and Appreciation Test (S-GRAT), the Gratitude Questionnaire (GQ-6), the Satisfaction With Life Scale (SWLS) and the Positive Affect and Negative Affect Schedule (PANAS). Multiple regression analyses showed significant positive associations between gratitude, life satisfaction, and positive affect. Significant negative associations were found between gratitude and negative affect. We can conclude that gratitude as an attitude is significantly associated with subjective well-being. Cultivating a grateful attitude may add to the subjective well-being of individuals with and without mental health problems.
O166
PARENTAL EMOTION SOCIALIZATION AND ITS RELATIONS WITH EMOTION REGULATION, SOCIAL DEVELOPMENT AND LANGUAGE DEVELOPMENT

B10. Development and education – Parenting

Bilgesu Hasçuhadar, Abant Izzet Baysal University, Bolu - Turkey
Hamit Coşkun, Abant Izzet Baysal University, Bolu – Turkey

Aim: In this research, the relations among the parental emotion socialization, child’s social competence, metaphor development and the mediational role of child’s emotion regulation in this relationship will be investigated. Introduction: Emotion socialization is defined as the parent’s responses and communication with their children when the children experience negative emotions. The parental emotion socialization have some influences on child’s emotion regulation and social competence. Also, child-parent interaction has also some impacts on language development. Method: The sample of study will include a total of 200 pre-school children whose ages are 5-6 years old, their mothers, and teachers. The children’s emotion regulation skills will be measured via the task of delaying gratification and metaphor development will be measured via the task of creating metaphor. Emotion socialization and parenting behaviors and social competence will be assessed by a means of scales. Expected Results: This planned study will demonstrate whether or not the relationship between parental emotion socialization and child rearing behaviors will be present in terms of different aspects of the child development and investigate whether or not child’s emotion regulation is a mediator variable in this relationship. Conclusion: The plausible results from the findings will contribute to the quality of parent-child relationship and intervention programs for child development.
O168
USING AVOIDANCE MOTIVATION TO DECREASE PROCRASTINATION BEHAVIOR AMONG STUDENTS

A11. General issues and basic processes - Motivation and emotion

Michal Milka Schodl, The Hebrew University of Jerusalem, Jerusalem - Israel
Aharon Raz, Ben Gurion University of the Negev, Beer Sheva – Israel

We tested the hypothesis that an increase in avoidance motivation reduces procrastination. Students participated in a longitudinal study about online self-learning tools. The learning tools were used to manipulate either an approach or avoidance motivation. After the manipulation, participants were offered a benefit (i.e., bonus points). Behavioral procrastination was operationalized as the time it took students to receive the benefit (by clicking a weblink), such that higher delay indicated greater procrastination. 96 students (73 females) completed a measure of chronic procrastination and then were randomly assigned to either the approach or avoidance manipulation conditions. The manipulation was operated twice, each time followed by two benefits. Thus, we measured behavioral procrastination four times during the semester and conducted four regression analyses and simple slope analyses regressing behavioral procrastination on chronic procrastination and approach/avoidance motivation. In three out of four measurements, our hypothesis was supported as increase in avoidance motivation either reduced behavioral procrastination (delay of action) or moderated the effect of chronic procrastination on behavioral procrastination. Specifically, we found that designing learning tasks that focused on avoiding mistakes reduced the tendency to delay small beneficial actions. Our findings suggest that avoidance motivation may protect against the chronic tendency to procrastinate.
IN Variant Measurement of Cancer Health Literacy Between Persons With and Without Cancer Diagnosis

Purpose: The Cancer Health Literacy Test – 30 (CHLT-30) was originally developed to measure cancer health literacy of persons with cancer. This study aims to test the measurement invariance of the CHLT-30 between persons with and without cancer and compare latent means between the two groups. Rationale: Invariant measurement properties of an instrument should be empirically demonstrated in groups excluded from the test development sample. Once the invariant measurement properties are established, this evidence will provide empirical basis to use the instrument in a new group and to allow for testing mean differences between the two groups. Results: The unidimensional measurement structure of the CHLT-30, originally proposed for persons with cancer (N = 1,306), was strongly supported in a group of persons without cancer diagnosis (N = 534). Results from test statistics supported the configural invariance and scalar invariance properties of the CHLT-30 between persons with and without cancer diagnosis. The latent mean difference test was significant (p < .001) and large (d = .50) indicating that the cancer health literacy score of persons with cancer is higher than those without cancer. Conclusion: In addition to the demonstrated invariant measurement properties of the CHLT-30 between gender and race/ethnic groups, this study provides construct validity evidence that the instrument can be used to measure cancer health literacy among persons without cancer diagnosis. Implications: The study results provide empirical support to the applicability of the CHLT beyond individuals with cancer. The evidence that persons with cancer score higher than persons without cancer may indicate changes in cancer health literacy level once the cancer diagnosis is made. Longitudinal studies are needed to test this hypothesis.
COME DINE WITH ME BATSWANA MEALS! EXPLORING INTERGENERATIONAL RELATIONS THROUGH TRADITIONAL FOOD KNOWLEDGE IN SOUTH AFRICA

F19. EXPO 2015 Hot Topics - Life skills in culture and society

Shingairai Chigeza, North-West University, Potchefstroom - South Africa

Traditional food knowledge (TFK) plays a key role in contributing to healthy and sustainable diets. Yet, traditional knowledge transfer between generations and consequently the usage of traditional foods is gradually decreasing. Participatory action research is applied which is embedded in community psychology, appreciative inquiry and fuses the disciplines of psychology and nutrition. Focus groups, intergenerational practises (IGPs), and world café method were conducted with 60 Batswana women in two rural communities in South Africa. Activities of the IGPs consist of preparing, cooking, and evaluating traditional dishes, inspired by the TV reality show ‘Come dine with me’ (ITV Studios, Shiver Productions). Findings of this ongoing research reveal the current knowledge and perceptions of traditional foods as well as the usage and meaning of traditional foods within the socio-cultural environment. The dynamics between generations in the context of the transfer of this knowledge are described. Based on perceived opportunities and challenges during the IGPs, approaches developed by participants to continue the transmission of TFK and nurturing of intergenerational relations in the communities are presented. TFK transfer can be one means of asserting relationship between traditional culture and healthy communities. More creative research is needed to explore on TFK in the context of intergenerational relations to enhance healthy diets, and relational wellbeing of communities.
O178
SIMILARITIES AND DIFFERENCES BETWEEN THERAPEUTIC ALLIANCE RUPTURE SESSIONS AND PRE-DROPOUT SESSIONS

E01. Health and clinical intervention - Assessing and accrediting quality of psychotherapy training and practice
I. Volkan Gulum, Hacettepe University, Ankara - Turkey
Gonca Soygüt Pekak, Hacettepe University, Ankara - Turkey

Psychotherapy research literature suggests that the therapeutic alliance is the most robust predictor of psychotherapy outcome and it is a common factor for every psychotherapy approach (Horvath, Del Re, Flückiger, & Symonds, 2011). One of the relevant factors, there is a significant relationship between therapeutic alliance quality and dropout rates (Roos&Werbart, 2013). However, to the best of our knowledge there is no systematic comparison between pre-dropout sessions and rupture sessions. The main purpose of this study is to compare the therapeutic alliance ruptures sessions and pre-dropout sessions in terms of rupture types, psychotherapists’ behaviors, attitudes and sessions’ contents. We examined Hacettepe University Psychotherapy Research Laboratory data set including Cognitive Behavioral Therapy and Schema Therapy sessions conducted by psychotherapy trainees. We mainly used qualitative methods to analyze16 different rupture sessions and 16 different pre-dropout sessions in micro levels. Additionally, we run some basic quantitative methods to improve data quality and clarity of the results. Results revealed that there are apparent differences and similarities between the rupture sessions and pre-dropout sessions in terms of positive psychotherapist behaviors, content intensity and the types and amount of ruptures.
The will to be a mother is a central component of many women’s identity, providing meaning to their lives and contributing to their life satisfaction. Difficulties to conceive may lead to stressful reactions. The study aimed to examine the contribution of stress, cognitive appraisal (threat, challenge, self-efficacy), and self-mastery to life satisfaction and meaning among women with/without children in the beginning of fertility treatments. One hundred and forty-five women completed questionnaires tapping stress, cognitive appraisal, self-mastery, life satisfaction, meaning in life and background information, during their first visit to fertility clinics. No differences were found between women with/without children in meaning and life satisfaction. Additionally, the associations between self-mastery and cognitive appraisals of threat and self-efficacy were mediated by the perception of stress: Higher levels of self-mastery were associated with lower levels of stress which, in turn, were associated with lower appraisal of threat; Higher levels of self-mastery were associated with lower levels of stress and higher cognitive appraisal of self-efficacy; Higher levels of self-mastery and lower levels of stress were associated with greater satisfaction and meaning in life. The findings suggest that it is important for the interdisciplinary staff to address psychological aspects, such as women’s cognitive appraisal of the treatments already at the first visit to the clinic.
EFFICIENCY OF MINDFULNESS BASED COGNITIVE TREATMENT IN REDUCING ANHEDONIA IN MAJOR DEPRESSIVE DISORDER

F22. EXPO 2015 Hot Topics - Sustainability and mindfulness

Ursa Malesic, Maastricht University, Maastricht - Netherlands
Frenk Peeters, University Hospital Maastricht, Maastricht - Netherlands

Anhedonia is a symptom characteristic for major depressive disorder (MDD) and is a deficit in two types of pleasure – anticipatory and consummatory. Anticipatory pleasure is experienced in relation to future activities while consummatory pleasure is experienced in the moment. A novel treatment for MDD that could be promising for lowering symptoms of anhedonia in depressed individuals is Mindfulness Based Cognitive Treatment (MBCT) that promotes the focus on the present moment. The aim of this study was to investigate the efficiency of MBCT in reducing anticipatory and consummatory anhedonia in participants with a history and current residual symptoms of MDD. The study did not find any effect of treatment group on change in anticipatory and consummatory pleasure over time. Furthermore, it was found that anticipatory pleasure is already lower in participants with more than 3 than those with less than 3 previous episodes of depression at baseline. However, consummatory pleasure increased as a consequence of MBCT treatment, but only in individuals with less than 3 previous depressive episodes. Focusing one’s attention on the present moment can therefore promote awareness of pleasurable experience, which results in increased consummatory pleasure. The study provides an insight in the differences between individuals with different history of depression and highlights the importance of investigating consummatory and anticipatory anhedonia as two different constructs.
O186
IS POOR SOCIAL FUNCTIONING OF PSYCHOTIC PATIENTS A RESULT OF INABILITY TO TRANSFER SOCIAL REWARD VALUE TO FUTURE SITUATIONS?

E16. Health and clinical intervention - Other
Ursa Malesic, Maastricht University, Maastricht - Netherlands

Poor social functioning is one of the main features of psychosis. A possible reason for poor social functioning in patients with psychosis is impaired reward sensitivity. The aim of this study was to investigate the extent to which positive affect (PA) experienced in social company leads to social engagement in the immediate future, and whether this pattern of consummatory experience informing social behavior differs between patients and controls. Furthermore, a combination of a Social functioning scale (SFS) and experience sampling method (ESM) used in this study allowed us to understand how reports on the questionnaire translate to everyday life. It was found that patients with psychosis report poorer social functioning than controls and spend more time alone. Also, SFS subscale ‘social withdrawal’ and reports of being alone during the ESM week were found to be directly associated with each other. Patients experienced higher levels of PA while in the company of others than controls. However, pleasantness of social company and PA while in company were not predictive of future engagement in social company in neither of the two groups. This study confirmed the results of previous studies that found poorer social functioning in patients with psychosis but suggested that positive experience during social company does not predict being in similar situations in the immediate future for either group. The study opens new questions and introduces possibilities for future research.
Background: Guided self-help interventions for PTSD are a promising tool for dissemination of contemporary psychological treatment, e.g. after crisis or disaster situations. After the 2008 Sichuan earthquake we investigated the efficacy of the Chinese version of the My Trauma Recovery (CMTR) website. Methods: In an urban context, 90 survivors of different trauma types were recruited via Internet advertisements and allocated for a randomized controlled trial (RCT) with a waiting list control condition. In a rural context 93 earthquake survivors were face-to-face recruited for a parallel RCT in which the website intervention was conducted in a counseling center and guided by volunteers. Assessment was completed online at a professional Chinese survey website. Primary outcome measure was the Posttraumatic Diagnostic Scale; secondary outcome measures were Symptom Checklist 90-Depression, Trauma Coping Self-Efficacy Scale, and Posttraumatic Cognitive Changes and Social Functioning Impairment questionnaires adopted from the My Trauma Recovery website. Results: For the urban sample, findings indicated a significant group × time interaction in posttraumatic symptoms severity. CMTR reduced posttraumatic symptoms significantly with high effect size after one-month treatment and the reduction was sustained over a 3-month follow-up. In the rural sample, the group × time interaction was also significant in posttraumatic symptoms severity. Posttraumatic symptoms decreased significantly after treatment and during the follow-up period. Additional outcome measures (posttraumatic cognitive changes, depression) indicated a range of positive effects, in particular in the urban sample, contributing to the positive evidence for self-help interventions. Differences in the effects in the two RCTs are exploratory explained by sociodemographic, motivational and setting feature differences between the two samples. Conclusions: These findings give support for the short-term efficacy of CMTR in the two Chinese populations and contribute to the literature that self-help Web-based programs can be used to provide mental health help for traumatized persons.
O191
PARENT SATISFACTION WITH TOURETTE SYNDROME TREATMENT FOR YOUNG PEOPLE

Başak İnce, Istanbul Arel University, Istanbul - Turkey

Tourette Syndrome (TS) is a neurodevelopmental disorder characterized by motor and vocal tics. Although effective treatments for TS have been found, no study has yet examined parent satisfaction with the treatment as an indicator of service and treatment quality. This study aimed to investigate parent satisfaction with TS treatment and the association between parent satisfaction and tic severity, tic frequency and general psychopathology in their children prior to treatment. Hence, parent satisfaction was examined following the attendance of their children at either habit reversal training or psychoeducation group treatments while they attended a parallel information and support group. Results showed that parents found the treatment to be very helpful. There was high satisfaction with the amount of information and the frequency of the sessions, and low satisfaction with the timing of the sessions, the number of the sessions and the duration of the sessions. The study could not find significant associations between parent satisfaction and any of patient-related variables or significant difference between treatment groups. A further qualitative analysis on parent experiences showed that obtaining information, social support and symptom reduction were the most satisfactory aspects of the treatment. Findings revealed that changing the number and the length of treatment sessions and the overall duration of the treatment might improve parent satisfaction with TS group treatments.
A considerable number of young people suffer from long-term conditions (LTCs) (e.g., asthma, orthopaedic illnesses and epilepsy) which are likely to lead to psychosocial burden. Research has shown that high percentages of young people with LTCs, particularly neurological illnesses, develop mental health problems. The co-occurrence of LTCs and psychological symptoms negatively impacts patients’ quality of life and their treatments. Hence, the current evaluation aimed to investigate whether young people with comorbid neurological and psychological conditions benefit from the administration of Evidence-Based Psychotherapies (EBPs). For this purpose, effectiveness of the EBPs was tested for 5 young people by calculating the added value score of the Strengths and Difficulties Questionnaire (SDQ) as an outcome measure for general psychopathology. Furthermore, clinical significance and reliable change indices were calculated for the symptom specific measurements (e.g., depression and anxiety). Findings indicated that 4 patients showed better improvement than predicted based on the SDQ Added Value Score. Furthermore, all patients showed clinically significant improvement after treatment, and only 2 patients showed both clinically significant and reliable improvement. The current evaluation demonstrated that it is possible to integrate EBPs into care for young people with comorbid neurological and psychological conditions and obtain good treatment outcome.

DISPLACEMENT EFFECTS ON FAMILY STRUCTURE AND ETHNIC
IDENTITY: MUSLIM MESKHETIANS IN THE USA

C16. Culture and society – Other

Ekaterine Pirtskhalava, Ivane Javakhishvili Tbilisi State University, Tbilisi – Georgia
Elene Pirtskhalava, Ivane Javakhishvili Tbilisi State University, Tbilisi – Georgia

This presentation is a part of my research which examines the impact processes of displacement on the family of the Muslim Meskhetians in the U.S. The Muslim Meskhetians, refer to a local population historically having been living in Samtskhe-Javakheti region of Georgia. Participant of this study are one part of the deported people from Meskhetia, (republic of Georgia) the Muslim Meskhetians, which since 2005 are living as a refugees in the U.S. In the Scholars articles this community are called differently as Meskhetian Turks or Turks from Meskehtia, In this article they are mentioned as Muslim Meskhetian. Combining face to face in-depth and groups interview with refugees, the study illustrates that Muslim Meskhetian refugee are carefully negotiating traditional values of family structure and family relationships in the U.S. according to new social environment. There is shown impact of marriage process in Muslim Meskhetians family.

IS UNCONSCIOUS JUDGMENT CULTURE BOUND? A CROSS-CULTURAL RESEARCH DUPLICATION

A13. General issues and basic processes - Thought, decision and action

Deborah, R. Vivo, ISPPREF, Istituto di Psicologia e Psicoterapia Relazionale e Familiare, Ospedale Universitario San Giovanni di Dio e Ruggi D’Aragona, Salerno - Italy

Conscious thought is rule-based and precise, but it has limited capacity. Unconscious thought, on the other hand, is less strict, creative, and has high capacity. A series of studies by Dijksterhuis and his colleagues support the idea that unconscious thought works better when complex decisions are at stake. Because of the importance of the implications of these findings (e.g., that people should stop consciously deliberating complex decisions), we decided to repeat one Dijksterhuis’ studies in order to examine whether the so-called “deliberation-without-attention” effect would still hold if we emphasized the role of experience and context in conscious decision-making.
O199
DOES UNIVERSITY STUDENTS’ SPIRITUAL AND RELIGIOUS ORIENTATION LEAD TO A MORE POSITIVE SOCIAL SELF-ESTEEM? A RESEARCH PROPOSAL

C13. Culture and society – Religion

Deborah, R. Vivo, Ospedale Universitario San Giovanni di Dio e Ruggi D’Aragona, Salerno – Italy

This research proposal is aimed at exploring whether University students with a spiritual or religious orientation have a more positive collective self-esteem (as defined by Luhtanen and Crocker, 1992) than students who do not have a spiritual or religious orientation. The research would include a demographic questionnaire, a spirituality/religiosity questionnaire and a measure of collective self-esteem (Luhtanen and Crocker’s COLLECTIVE SELF-ESTEEM SCALE), in order to find out whether there is a positive correlation between high scores in spirituality/religiosity and high scores in collective self-esteem. I would expect that students who have a religious / spiritual orientation - whether or not they are active members of a religious (in)group - develop a sounder self-concept which ultimately leads to a more positive social self-esteem.
O200
NEGATIVE EMOTIONS AT WORK AS A SOURCE OF JOB BURNOUT: THE MODERATING EFFECT OF TRAIT EMOTIONAL INTELLIGENCE

D04. Work and organization - Well-being at work

Dorota Szczygiel, Warsaw School of Social Sciences and Humanities, Faculty in Sopot, Warsaw – Poland
Lukasz Baka, Jan Długosz University, Czestochowa – Poland

The aim of the study was to verify the hypothesis that trait emotional intelligence (EI) acts as a moderator in the relationship between negative emotions experienced at work and emotional exhaustion (EE) which is considered to be the core symptom of the burnout syndrome. Participants (nurses working in hospitals in Poland, N=177) were presented with a list of adjectives describing emotions and asked to rate the extent to which they experienced each emotion at work. A list of emotions contained: positive emotions (contentment, pride, enthusiasm and joy), anger-related emotions (ARE, annoyance, antipathy, anger), and sadness-related emotions (SRE, sadness, dissatisfaction, disappointment). Participants also completed measures of trait EI and EE. Positive and negative affectivity, measured with PANAS, were also controlled. To test the hypothesis, moderated hierarchical multiple regression analyses were performed. Results showed that the interaction of ARE and IE term was significant and accounted for a significant portion of the variance in EE. ARE were positively related to EE among employees who were low in trait EI. In contrast, ARE and EE were unrelated among employees who were high in trait. The interaction of SRE and IE term was not significant and did not explain any additional variance in EE beyond the main effects. The results of the study demonstrated that trait EI functions as a psychological resource that buffers the negative association between ARE and burnout.
O201
THE INFLUENCE OF PRISON EDUCATION TO BUILD CITIZENSHIP AND RETURN TO THE COMMUNITY

B03. Development and education - Learning and instruction

Francisco Ramos de Farias, Federal University of the State of Rio de Janeiro, Rio de Janeiro - Brazil

This paper presents the preliminary results of an ongoing research that aims to produce a reflection on the public education policies in prisons, evaluating its implementation, operation and outcomes in terms of remission of penalty and the possibility of building alternatives in recovery of criminals to society. This aim was done with tracking laws, decrees, resolutions and other official documents as well as a review of the literary regard of this subject. During the process a laboratory of social practices and research on violence for the production of a school theme collection in prisons was set up. An orientation space was also created for prisoners who were in a semi-open system and on parole, who demonstrated an interest in school education. Those who wished to be integrated into the job market were also assisted. A referral to public health institutions for the psychosocial support of those who brought indelible marks of stay in prison was included as well as those who intend to develop the condition as criminal. The networking with professionals from various fields was a strategy for this purpose. The work done to date shows that the inclusion in the education and preparation for the job market are actions that facilitate the construction of citizenship after being released from prison, as an alternative identity position different from a criminal one.
O202
THE TRANSITION OF EGRESS FROM THE PENITENTIARY SYSTEM TO THE COMMUNITY AFTER SERVING A SENTENCE: POSITIVE ASPECTS, CONTRADICTIONS AND IMPASSES

C11. Culture and society - Forensic psychology and law

Francisco Ramos de Farras, Federal University of the State of Rio de Janeiro, Rio de Janeiro - Brazil

This paper discusses the results of a survey regarding the transition of the penal system to life in society and the development of devices for the psychosocial, educational and legal counsel, contributing to the reconstruction of citizenship and the circulation in the context of relationships. These actions were undertaken at the Laboratory of Social Practice and Research on Violence (LPSPV) of the Post-Graduate Program in Social Memory at the Federal University of the State of Rio de Janeiro (UNIRIO). The cartographic method was adopted in this research, being centered on the construction of the memory of egresses coming from the prison system of the State of Rio de Janeiro. The survey was built on three methodological steps: survey of journal’s investigation; documentary survey; and conducting group interviews. Data analysis was based on the life stories method. The results have highlighted that the process of institutionalization affects the subject, so that the transference of values from prison culture can function as a mnemonic device for submission’s maintenance, even after prison release. At the same time, transition plans are imbued with their memories related to condition as prisoners. Finally, the identity construction processes reflects, in a significant way, on difficulties of building life projects.
O203
MANIFESTATION OF THE DISCRIMINATORY ATTITUDE AS A EVALUATION OF FACIAL APPEARANCE OF REPRESENTATIVES ETHNO-CULTURAL GROUPS

B07. Development and education - Social cognition, identity and social interactions

Vera Labunskaya, Southern Federal University, Rostov-on-Don - Russian Federation

The research purpose is a definition of features of evaluation of various components of ethno-cultural types of facial appearance. Research Methods: The technique “Estimated and intentional interpretation of facial appearance and its correspondence to gender and age constructs”. In the questionnaire facial appearance types: “Slavic facial appearance”, “Caucasian facial appearance”, “Asian facial appearance” are the objects of evaluation. We have offered the participants of research to estimate the degree of correspondence of judgments to a certain type of facial appearance according to the 10 scoring system. For the purpose of definition of distinctions between estimations of “Slavic facial appearance”, “Caucasian facial appearance”, “Asian facial appearance” we have used Wilcoxon’s nonparametric Z-criterion (SPSS 16.00 program). Research subjects: Russian students - 37 women, 15 men at the age from to 25 years. Results of research: The discriminatory attitude to groups with a certain type of facial appearance is expressed in various levels of estimations of components of facial appearance. Conclusion: The students consider that both men and women having “Slavic type of facial appearance” are more beautiful, attractive, more masculine or feminine, than the persons of “Caucasian or Asian type of facial appearance”. The discriminatory attitude presented in different types of estimations was shown to people with “Asian type of facial appearance” in a greater degree.

FORMING FAMILIES WITH SURROGATES: PSYCHOLOGICAL AND LEGAL BEST PRACTICES

C02. Culture and society - Family systems and processes

Michelle Loris, World Wide Surrogacy LLC, Law Firm of Victoria Ferrara, Fairfield - United States
Victoria Ferrara, World Wide Surrogacy LLC, Law Firm of Victoria Ferrara, Fairfield - United States

This presentation will discuss the psychological and legal best practices for working with Intended Parents who are forming families with Gestational Surrogates. Today more and more couples, both same sex and heterosexual, are forming families by using surrogates; yet no uniform legal or psychological practices are in place to help and work with these couples. These presenters have been working together for over ten years helping couples form families with gestational surrogates and they have developed a protocol of best psychological and legal practices to help couples through what is a very long, complicated process involving medical, legal, psychological, and family issues. In this presentation, we will outline the protocol of legal and psychological process, policies, practices we have developed. We will illustrate the complexities and obstacles ---both psychological and legal---by using case examples, and we will discuss some of the issues and problems that are emerging in international surrogacy.
WORKPLACE TRANSLATION OF THE DIABETES PREVENTION PROGRAM: PHASE I AND II RESULTS

The Diabetes Prevention Program (PPE) is a clinically effective, theory-based intervention focusing on weight management and physical activity. This presentation summarizes phase I and II results from a workplace translation of DPP. Finding an acceptable trade-off between intensity and effectiveness is a primary challenge of translation and is particularly crucial for widespread workplace adoption. A primary ingredient of the original DPP was frequent one-on-one interaction with a trained “lifestyle coach”. The current trial compared three delivery modes: group coaching sessions, telephonic coaching, and self-study. The primary outcome was weight loss with secondary outcomes of healthy eating and physical activity. Incremental cost effectiveness was used to compare the three treatment conditions. Results from the first two phases of this three phase study indicate that telephonic coaching was more effective than the other delivery modes and associated with a mean weight loss of approximately 6 lbs. at the conclusion of the core intervention (six months). The telephonic condition was about twice as expensive as the group condition, which was about twice as costly as self-study. Process evaluation data suggest that telephonic treatment costs could be reduced with little impact on effectiveness through modification of the calling protocol. These results are discussed in terms of developing a version of DPP suitable for adoption in different types of work settings.
ROLE OF SOCIAL SUPPORT IN WORK-FAMILY BALANCE BY CONSIDERING THE MEDIATING ROLE OF CORE SELF-EVALUATION

Monirsadat Zakerfard, University of Isfahan, Isfahan - Iran
Aboulghassem Nouri, University of Isfahan, Isfahan - Iran
Hooshang Talebi, University of Isfahan, Isfahan - Iran
Hossein Samavatyan, University of Isfahan, Isfahan - Iran

The present research was designed to examine the role of social support in work-family balance also the role of individual differences in this relationship. The assumptions were analyzed using structural equation method among employees in a governmental organization in Iran. Using stratified random sampling, a number of 150 employees were selected from the study population. The research tools included Questionnaire of Work-Family Balance (Carlson et al. 2009), Family and Colleague Support Measure (O’Driscoll et al., 2004), Survey of Perceived supervisor support (Rhoades and Eisenberger, 2000) and Core-Self Evaluation Scale (Judge et al, 2003). Results of structural equation showed that the direct influence exerted by family support, colleague support and supervisor support on work-family balance was not meaningful. However, considering its indirect influence, results revealed that core self-evaluation played a completely mediatory role in the relationship between family support and colleague support, while its influence on the relationship between supervisor support and work-family balance was not meaningful. The present study was conducted on the basis of conservation of resources (COR) theory. Since little research has been conducted on the role of social support in work-family balance considering cross-individual differences, the present research may be regarded as new in this manner and it creates some opportunity for developing more research on cross-individual and cross-cultural differences in work-family balance.
Self-control is a powerful tool that promotes goal pursuit by helping individuals curb personal desires, follow norms, and adopt rational thinking. In interdependent social contexts, the socially acceptable (i.e. normative) and rational approach to secure long-term goals is prosocial behavior. Consistent with that, much research associates self-control with prosociality. The present research demonstrates that when norm salience is reduced (i.e. social relations are no longer interdependent), high self-control leads to more selfish behavior when it is economically rational. In three studies, participants were asked to allocate an endowment between themselves and another person (one-round, zero-sum version of the dictator game), facing a conflict between a socially normative and an economically rational approach. Across the studies, norm salience was manipulated [through manipulation of social context (private/public; Studies 1 and 2), measurement of social desirability (Studies 1 and 3), and measurement (Study 2) and manipulation (Study 3) of social power] such that some participants experienced low normative pressure. Findings showed that among individuals in a low normative pressure context, self-control led to economically rational, yet selfish, behavior. The findings highlight the role of self-control in regulating behavior so as to maximize situational adaptation.
A VIBROTACTILE DEVICE TO HELP OLDER PEDESTRIANS TO GET AROUND SAFELY

Old pedestrians are overrepresented in fatal accidents. Many studies have consistently shown slower decision making, wrong time estimation, slower walking speed and navigation difficulties that lead to dangerous pedestrian behaviors and/or travel reduction with aging. In this context, the present study aims at developing and assessing the efficiency of a vibrotactile navigation assistance to support old pedestrians to cross the street and get around safely. To this end, 40 old participants aged between 70 and 80 and 20 young adults take part in two simulated pedestrian tasks. The first one is a street crossing task where participants actually cross a two-way experimental road in a virtual environment. The second one is a navigation task where participants have to go from point A to point B in a virtual city. Each task is performed with and without a vibrotactile wristband delivering alert messages (street crossing) and directional messages (navigation). Data are currently being collected. We hypothesize that both young and old pedestrians will benefit from the vibrotactile aid system, with fewer dangerous street crossing decisions and more efficient navigation patterns. We expect a stronger effect in the old participants’ group. If such a vibrotactile device offsets difficulties related to cognitive and perceptual decline in old pedestrians, it can contribute to maintaining their travel autonomy and reduce the risk of fatal accidents.
O221
TO DO, TO HAVE, OR TO SAVE? WELL-BEING AND MATERIALISM AS PREDICTORS OF FINANCIAL INVESTMENT – CROATIAN CASE

F03. EXPO 2015 Hot Topics - Consumer behaviour

Ljiljana Kaliterna Lipovcan, Ivo Pilar Institute of Social Sciences, Zagreb – Croatia
Zvjezdana Prizmic-Larsen, Washington University, St.Louis - United States
Andreja Brajsa-Zganec, Ivo Pilar Institute of Social Sciences, Zagreb – Croatia
Tihana Brkljacic, Ivo Pilar Institute of Social Sciences, Zagreb – Croatia

Research suggests that people are happier if they spend money on experiential purchases such as travel, rather than on material purchases. This study examined the predictive values of wellbeing variables and materialism for the persons’ financial investments into savings, experiential or material purchases. Subjects were a representative sample of Croatian citizens (N=1000, 51% women). The reported their life satisfaction, and completed Personal Wellbeing Index (which includes satisfaction with 7 life domains: material status, health, achievement, relationships, safety, community and future security), and a materialism scale. Also, they reported how they would spend their extra money either in experiential purchases, in material purchases or putting into savings. While controlling for gender, age, and income, hierarchical regression analyses showed that being younger, with higher income, satisfied with the life as a whole and satisfied with their achievements were the strongest predictors of experiential purchases. People who would invest in material purchases were younger and more materialistic than their counterparts. People who would rather save their money were older, with lower income, and less materialistic than their counterparts. Economic and cultural environments are discussed as possible contextual influences for how people choose to spend or save their money.
PROTESTS AND SOCIAL DISCONTENT IN BRAZILIAN CONTEMPORARY

C16. Culture and society - Other

Rafael Andres Patiño Orozco, Federal University of the State of Rio de Jaineiro, Rio de Janeiro - Brazil
Francisco Ramos de Farias, Federal University of the State of Rio de Jaineiro, Rio de Janeiro - Brazil

This paper aims to present the meaning of social protests which took place in Brazil on June 2013 in an economic prosperity context. This research was based on social psychology as a framework that allows critical analysis of processes of social changes and interdisciplinary dialogue. The study was guided by qualitative methodology and it was adopted by a method of content analysis to address the testimony of protesters, published in virtual media during these events. A Categorization process was prepared in a hermeneutic unit in Atlas-ti 6.2 software. It was identified that these social movements can be considered as an expression of contemporary discontent at the failure of the Modernity’s political-economic project. Protests are also forms of manifestation of indignation related to events considered as morally unjust. They can motivate the creation of alternatives with the purpose of social transformation, but may also arise in the form of radical groups that advocate violence as a means of protest. At the same time, these movements represent forms of resistance against legitimate loss of Government and traditional channels of political participation. In this sense, these subsequente events represent new modes of subjectivation.
O224
SUBJECTIVE CONFIGURATIONS OF RELATIVES OF VICTIMS OF FORCED DISAPPEARANCE IN COLOMBIA

C16. Culture and society – Other

Rafael Andres Patiño Orozco, Federal University of the State of Rio de Janeiro, Rio de Janeiro - Brazil
Francisco Ramos de Farias, Federal University of the State of Rio de Janeiro, Rio de Janeiro - Brazil

Based on a historical-cultural perspective of Social Psychology, the aim of this study was to understand the subjective configurations on relatives of forced disappearances in the context of the Colombian armed conflict. The research grew out of a study design of multiple cases. Unstructured interviews were conducted, with three focus groups and a phrase complementation tool. The information produced was integrated into a hermeneutics unit in Atlas-ti 6.2. The data analysis was conducted using abductive reasoning for identifying configurations of meaning. It was found that the relatives of forced disappearances remain in a state of mourning: a fracture in memory caused by the uncertainty about what happened to their loved one, accompanied by the inability to build a sense of loss and, therefore, to grieve. Despite the uncertainty, there are some possible ways to progress the loss and overcome the mourning. It is possible to construct meaning about the traumatic experience from farewell rituals and repair actions, such as fact-finding and conviction of those responsible in court. Some individuals manage to overcome their mourning by building new meanings to life through work, political or academic lessons. We conclude that the overcoming of grief involves individual, historical and social elements. Therefore, the society and the state have a crucial role in ensuring the implementation of a repair process accompanying the significance of the traumatic experience.
O225

COGNITIVE ORIENTATION AS A TOOL FOR IDENTIFYING PSYCHOLOGICAL RISK FACTORS FOR COLORECTAL CANCER

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Shulamith Kreitler, Tel-Aviv University and Sheba Medical Center, Tel-Aviv - Israel
Michal M. Kreitler, Tel-Aviv University, Tel-Aviv - Israel
Frida Barak, Barzilai Medical Center, Ashkelon - Israel

The purpose was to identify personality correlates of colon cancer patients by applying a new methodology of studying beliefs, based on the cognitive orientation theory. In study A the personality questionnaire was administered to 106 colon cancer patients and 99 matched healthy controls. The results showed that the main psychological features of the patients, independent of demographic and medical factors, were self-restraint, controlling themselves and others, pent-up anger, increased demands of themselves and perfectionism. The findings were confirmed in study B with 230 colorectal cancer patients. Gender differences were found in responses. In study C discriminant analysis showed that the questionnaire identified significantly cases of three groups (165 healthy controls, 90 Crohn patients at risk for cancer, 230 colorectal cancer patients). The personality correlates of colorectal cancer were tendencies for compulsiveness, control of oneself, anger, self effacement, pleasing others, self assertion, distancing oneself from others, keeping regulations, and performing obligations perfectly. The three major foci are perfect duty performance, and two contradictory pairs: self effacement versus self assertion, and closeness to others versus distancing from others. The clusters and the contrasts constitute sources of tension. It is suggested that the identified personality correlates be considered as psychological risk factors for colorectal cancer.
O227
MEANING-BASED ASSESSMENT OF CREATIVITY

A12. General issues and basic processes - Intelligence and cognitive functioning

Shulamith Kreitler, Tel-Aviv University and Sheba Medical Center, Tel-Aviv - Israel
Kineret Weissler, Tel-Aviv University, Tel-Aviv - Israel

The purpose was to develop a procedure of assessing creativity by the Kreitler meaning system which is a psychosemantically-grounded system of processes underlying cognitive acts. Three studies will be presented, describing the meaning variables differentiating between more and less creative participants, in different samples of children, and with different measures of creativity. In the first study 158 children (ages7;2-9;4) were administered the meaning test, the Wechsler IQ test and the Torrance test of creativity. In the second study 71 children (mean age 10;9) were administered the meaning test and their drawings were evaluated for creativity by 3 independent experts. In the third study 238 Beduin children (mean age 13;7) were administered the meaning test and the questionnaire “The Things Done on your Own” (Torrance). In each study the meaning variables differentiating between the more and less creative were identified. The creative children used more dynamic terms, considered the objective aspects of objects, emphasized the experiential aspects of emotions and cognitions, used nonverbal forms of expression and focused both on external and internal reality, on the general and the specific, on the personal-subjective and the interpersonally-shared, on the present inputs and the distant ones. It is suggested that the meaning variables characterizing the more creative children could be used as an assessment instrument for creativity and for developing creativity.
This study was undertaken to explore the relationship organizational climate and organizational commitment (normative and affective) as mediated by organizational identification. A total of 350 white-collar employees completed organizational commitment (affective and normative parts), organizational climate (open, supportive, management, responsibility, criteria, stress, team, innovation and manager dimensions). As indicated in hypotheses, organizational climate predicted affective and normative commitment and these relationships are mediated by employees’ organizational identification. In addition both organizational climate and organizational identification predicts 76% of affective and normative commitment. The results showed that organizations needs to increase their identification based programs in order to secure organizational commitment. Further studies and limitations will be discussed.
O236
MANAGERS WHO PROVIDE SECURE BASE: DO THEY INCREASE PROMOTION FOCUS?

D02. Work and organization - Leadership and entrepreneurship

Michal Lehmann, The Hebrew University of Jerusalem, Jerusalem – Israel
Avraham N. Kluger, The Hebrew University of Jerusalem, Jerusalem - Israel

Both attachment theory and regulatory-focus theory (RFT) make similar predictions: Attachment theory suggests that a relationship that provides a secure base increases exploration; RFT suggests that nurturance needs activate promotion focus, which is also associated with exploration. These predictions may also be relevant for relationships at work. Thus, we hypothesize that a manager who provides a secure base increases promotion focus among employees, and consequently increases the likelihood that employees perform promotion tasks (vs. prevention tasks). We ran four scenario experiments, priming either a secure or an insecure base with a manager. In Study 1 & 2 (N = 53, N = 301, respectively), after the prime, participants rated the likelihood that they would perform promotion and prevention tasks. In Study 3 & 4 (N = 101, N = 121, respectively), participants chose between promotion or prevention tasks. Across all studies, a secure base increased promotion focus (d = 0.67, p < .02; d = 0.22, p < .06, d = 0.56, p < .01; d = 0.49, p < .01, respectively). To our knowledge, this is the first study to link between attachment theory and RFT. Moreover, this research suggests that fostering good subordinate-supervisor relationships is likely to be rewarded with promotion-focused behaviors such as creativity and innovation.
O238
HOW "TALENTS" ARE DIFFERENT FROM OTHER PEOPLE: DIFFERENTIATING FACTORS

A14. General issues and basic processes – Personality

H. Ulas Ozcan, Hasan Kalyoncu University, Istanbul - Turkey

This study examined the profile of the employees who are called as “talents” in different organizations and different sectors. Total 2830 white-collar employees participated to the study and 189 of them were called as “talents” in their organizations. All participants completed reasoning test, needs scales (nAff, nAch, nPow, nCog), time perspectives scales, change orientation scale, self-efficacy, uncertainty tolerance, ambiguity tolerance, locus of control scales. The results showed that the employees who are called as “talent” showed significant differences in all these dimensions. Specifically, talents showed significantly higher level of reasoning, nAch, nPow, nCog, change orientation, self-efficacy, locus of control and ambiguity tolerance. They also had significantly low level of uncertainty tolerance and nAff. In addition, talents also had a pattern of time perspective. Specifically, they were highly future oriented and showed low level of past-orientation and present orientation regarding with fatalism. This study showed that there is a need to investigate specific profiles in employees.
WORK-FAMILY CONFLICT, FAMILY SATISFACTION AND EMPLOYEE WELLBEING: A COMPARATIVE STUDY OF AUSTRALIAN AND INDIAN SOCIAL WORKERS

D04. Work and organization - Well-being at work

Thomas Kalliath, Australian National University, Canberra – Australia
Parveen Kalliath, Australian Catholic University, Canberra – Australia
Christopher Chan, York University, Toronto – Canada

The purpose of the study was to investigate family satisfaction as a mediating mechanism through which work-family conflict influences are transmitted on the wellbeing of social workers, who are exposed to high stress work environments. To date, few studies have compared work-family conflict experiences of social workers across national cultures. The present study addresses the gap in the literature by investigating this mediating relationship in samples of Australian (n=439) and Indian (n=428) social workers. Survey of professional social workers resulted in two large samples that had comparable demographic characteristics. Confirmatory factor analyses using 3 work-family conflict variables (Time, Strain and Behaviour), family satisfaction, and wellbeing showed good fitting models. We then proceeded to test the structural models using AMOS, and found that family satisfaction mediated the relationship between work-family conflict (Behaviour) and wellbeing in both Australian and Indian samples, and also mediated the relationships between work-family conflict (Time and Strain) and wellbeing in the Indian sample. The findings of our study contribute to the work-family conflict literature by uncovering interesting cultural similarities and differences in the work-family conflict experiences of social workers in the Australian and Indian samples. Practical implications for human resource management policies of social service agencies in both countries are discussed.
O241
INTERCULTURAL WILLINGNESS TO COMMUNICATE WITHIN HEALTH SERVICES; INVESTIGATING ANXIETY, UNCERTAINTY, ETHNOCENTRISM AND HELP SEEKING

C05. Culture and society - Group processes and intergroup relations

Shanna Logan, University of Sydney, Sydney - Australia
Zachary Steel, UNSW Australia, Sydney – Australia
Caroline Hunt, University of Sydney, Sydney – Australia

In order to better understand barriers to initial engagement with health services by ethnic minority patients, the current study experimentally investigated the effect of low and high perceived predictability of an intercultural health professional within a low or high anxiety provoking health interaction, on willingness to interact. Additionally, the study aimed to assess the impact of state and trait anxiety, and the contribution of ethnocentrism and attitudes towards seeking psychological help, on willingness to interact within a health setting. Results indicate that both state anxiety and an anxiety provoking situation are significant predictors of willingness to interact, with high anxiety leading to less willingness to interact, a finding enhanced when predictability was also low. Also a heightened anxiety provoking situation was found to have a direct effect on the perceived predictability of an intercultural health interaction partner. Despite previous research indicating the importance of help seeking behaviour and cultural attitudes in negatively influencing engagement with health services, the current study found that state anxiety was a more significant indicator of willingness to interact in a cross-cultural health interaction than these other indicators.
**O242**

**ETHNICITY AND SERVICE USE: AN ANALYSIS OF SERVICE USE AND TIME TO ACCESS TREATMENT BY ETHNICITY STATUS IN A LOCAL MENTAL HEALTH SERVICE**

C07. Culture and society - Race and ethnicity

Shanna Logan, University of Sydney, Sydney - Australia
David Rouen, South Western Sydney Local Health District, Sydney – Australia
Renate Wagner, South Western Sydney Local Health District, Sydney – Australia
Zachary Steel, University of New South Wales, Sydney – Australia
Caroline Hunt, University of Sydney, Sydney – Australia

The current research aimed to assess the impact of ethnicity status on mental health service use in a metropolitan area in Australia. Middle Eastern and South East Asian minority ethnicity status was compared to native Australian majority ethnicity status, as these were the two largest cultural groups residing within the local area. Clients who accessed the Clinic for Anxiety and Traumatic Stress in Western Sydney between 1996 and 2010 underwent a clinical assessment and research interview prior to receiving treatment to determine both illness history and cultural background. Data was extracted from these files on demographic information and health history. Relative to the local population, ethnic minority status was associated with fewer patients accessing the service, with South East Asian patients reporting lowest service across all cohorts studied. However, Middle Eastern patients' service utilization increased with each successive cohort over time. No significant differences between ethnicity status and duration of treatment delay were reported. In order to further understand this discrepancy, post hoc analyses with language groups were conducted, which revealed that those who spoke Arabic within the family home reported a shorter treatment delay overall. Lower than expected use of the service was found in South East Asian and Middle Eastern ethnic minority patients, commensurate with previous literature reporting lower service use by ethnic minorities. Differences in treatment delay by ethnicity status or language highlight the importance of understanding differences both within and between cultural groups, to further understand the impact of culture on service use.
Effect of Intergroup Comparisons and Anonymity on Performance in a Team Game-based Learning Environment

Benjamin Le Hénaff, University of Rennes 2, Rennes - France
Nicolas Michinov, University of Rennes 2, Rennes – France
Olivier Le Bohec, University of Rennes 2, Rennes – France

The aim of this communication is to extend the SIDE Model (Social Identity model of Deindividuation Effects) to a team game-based learning environment. This model is rooted into the social identity theoretical framework. According to SIDE, people in an anonymous state while their social identity is rendered salient by an intergroup comparison, identify more with their group, leading to a higher motivation to put their group in a positive light. Nevertheless, few studies have examined how the variables involved in that model affected performance in online learning environments. In order to study how this model may be applied to such environments, an online system was developed to help students acquiring basic computing knowledge from quizzes. The system offered the possibility to deliver intergroup comparison feedback in real-time to increase the salience of group identity either in anonymity or individuation conditions. Results showed that when group identity was salient, performance was higher for anonymous students rather than individuated ones, but only for those who had low prior knowledge of computing skills. A similar benefit of anonymity was observed when group identity was not salient among students with high prior knowledge. These findings may have implications on the development of online learning environments where social gaming can be used to boost learning motivation and performance with social and psychological theoretical models such as SIDE.
O250
CONCEPTUAL STRUCTURES AND PRODUCTIVITY OF COGNITIVE FUNCTIONING

A12. General issues and basic processes - Intelligence and cognitive functioning

Elena Volkova, Institute of Psychology, Russian Academy of Sciences, Moscow - Russian Federation
Marina Kholodnaya, Institute of Psychology, Russian Academy of Sciences, Moscow - Russian Federation

Definition of intelligence in terms of its properties turned it into a catalog of cognitive functions which greatly varies in different authors. Intelligence as a holistic mental reality disappeared. We offer to pass from describing the properties of the intelligence to the issue of the nature of mental formations which "inside" determines the properties of intelligence. In terms of a new approach conceptual structures are viewed as a substratum of conceptual abilities. Conceptual (semantic, categorical, generative) abilities are central link to the structure of intelligence which is described as a form of individual mental experiences. We name this approach to the study of intelligence as ontological one. Our study aimed to reveal interrelations between the conceptual structures and productivity of different types of cognitive functioning. A multiple design was used in our research including assessment of conceptual structures (Kholodnaya, Volkova), conceptual abilities (Kholodnaya, Savin), creativity (TTCT), intelligence (SPM, WAIS, WISC), field dependence/field independence (EFT), impulsivity/reflectivity (MFFT). Participants of the experiment were 480 students aged 14-22 years. The data obtained convincingly demonstrates resource functions of conceptual abilities in growth of creativity, verbal and nonverbal intelligence, competence; mobilization of involuntary control in terms of perceptual structuring and scanning; activation of the process of generating mental narratives.
Peer coaching (PC) refers to relational resources for professional growth. The literature has acknowledged a lack of systematic approach to introducing PC in organizations. In responding to this gap we conducted a quasi-field experiment involving a 5-day PC training programme. A total of 45 teachers participated in the training in order to develop PC competencies. Participants voluntarily filled in the questionnaire before and after the participation in the PC training. The questionnaire measured coaching competencies, establishing coaching relationship, active listening skills, core self-evaluations (CSEs), and teacher self-efficacy. The results showed a significant improvement of the target competencies after the completion of the training. Supplementary results showed a significant interaction effect of CSEs and coaching competence on training outcomes. We found that teachers with higher CSEs showed a significantly higher improvement of their coaching competencies compared to teachers with lower CSEs. Coaching as a method of workplace learning is a growing field of study. This is one of few empirical studies exploring the effectiveness of PC programmes. In terms of theory development, our study implies that personality traits might have an important role in developing coaching competencies. In terms of methodological implications, we have showed that quasi-field experiments can be successfully used in studying the development of coaching competencies.
THE SCREEN BETWEEN: ARE MOBILE PHONES USED IN WAYS THAT DISTRACT FROM OR FACILITATE FRIENDSHIP INTERACTIONS?

A16. General issues and basic processes - Other

Presenter: Genavee Brown, Western Washington University, Bellingham - United States
Adriana Manago, Western Washington University, Bellingham - United States
Joseph Trimble, Western Washington University, Bellingham - United States
Nicolas Michinov, University of Rennes 2, Rennes - France

Today, mobile phones are ubiquitous, indispensable digital communication tools, but they may intrude upon face-to-face (FtF) interactions, including those between pairs of friends. As a tool, the phone may be used in at least four different ways during interactions: distraction, distraction multitasking, facilitation, and facilitation multitasking. Distraction occurs when the participant is focused exclusively on the phone. Distraction multitasking occurs when the participant divides their attention between friend and phone. Facilitation occurs when information is shared via the phone. Facilitation multitasking occurs when shared information is discussed. The aim of the current study was to observe which of these phone use behaviors would occur and in what amounts. Pairs of friends were unobtrusively filmed during brief interaction in a waiting room setting where the 4 types of mobile phone use behaviors were observed. Results showed that of distraction and distraction multitasking were more common uses of the mobile phone than facilitation and facilitation multitasking. The present results showed that when mobile phones are used in friendship interactions they seem to be used in ways that distract from the FtF interactions that should be fulfilling our relational needs.

PERSONALITY WITHOUT BORDERS: DO QUESTIONNAIRE LANGUAGES AND SMART-PHONES BIAS RESULTS?

D01. Work and organization - HR assessment and development

Rob Bailey, OPP Ltd, Oxford - United Kingdom
Tatiana Gulko, OPP Ltd, Oxford - United Kingdom
Sofia Lundahl, Lund University, Lund – Sweden
Elin Wetterberg, Lund University, Lund – Sweden

Purpose: Linguistic, cultural and psychological issues may bias multi-lingual psychometric assessment of personality. Bias may also arise from questionnaire completion via websites vs. mobile phones. This presentation explores two studies which test these assumptions. The rationale for this work is that mobile vs. web differences have not been widely studied. Additionally, 16PF is unusual in that it has idiosyncratic items, which cause a challenge to translation and adaptation. Methodology: Data were collected from 4,900 people completing the 16PF in US English, UK English, Norwegian, Danish, German, French, Italian, Spanish, Swedish, and Dutch. Data were collected for 500 people completing a short version of the 16PF on the web and via a mobile app. Differential Item Functioning (DIF) was used to examine item level and scale level data. T-tests were used to assess scale level differences. Results: Significant DIF was found in a high number of items for each language. However, the effect size of the DIF (estimated in lordif in R), showed very few items had DIF big enough to cause a practical effect at the scale level. For the web/phone data only four items were flagged for significant DIF, but none showed practically DIF. There were five significant trait differences; however, effect sizes are small. Conclusions/implications Mobile or web administration does not seem to cause bias. Some bias occurs via different languages, but not enough to have a major practical effect. The analysis was limited to an EU/US sample; however, preliminary analysis suggests other versions (e.g. Traditional Chinese) show less variation than some of the European languages. The results suggest recruitment with mixed assessment languages will be fair to candidates.
Lack of entrepreneurial skills among the youths in Nigeria accounts for most youth unemployment which of course makes them vulnerable to different social crimes leading to insecurity in Nigeria. Economic insecurity has the potential of exposing the people to poverty starvation, restiveness, underdevelopment, social vices and general state of insecurity. The persistence of such a situation exposes everyone directly or indirectly, to avoidable dangers of social crisis and violence. It is believed that the challenges of unemployment and joblessness can predispose a nation to economic insecurity. The introduction of entrepreneurship education into the education system of Nigeria is a well conceived policy that empowers the youths with functional skills and thereby reduces insecurity of all kinds among them and the nation in general. This present work therefore set out to find out whether acquisition of entrepreneurial skills among the youths will create employment for them and possibly reduce insecurity experienced in Nigeria today, specifically the study sought to find out the causes of insecurity in Nigeria and skills necessary for entrepreneurial occupation in Nigeria. The significance of the study is that all concerned about the youth and development will see that acquisition of entrepreneurial skills assist youths not only to be gainfully employed but also to employ themselves and thereby contribute to economic security and eventual reduction of insecurity and development of the nation, that will increase the practical input in entrepreneurial education being introduced in schools. It will also boost vocational guidance in schools. To guide the study, three research questions were raised thus: (a) What are the causes of insecurity in Nigeria? (b) What requisite skills are needed for entrepreneurship occupation? (c) What are the contributions of entrepreneurial skills training in insecurity reduction? Also three null hypothesis were raised and tested at the probability of 0.05 level of significance thus: (a) There is no significance difference among workers in the three selected Nigerian universities with respect to their views on the causes of insecurity in Nigeria. (b) There is no significant difference among workers of two different faculties with respect to their views on requisite skills needed for entrepreneurship occupation. (c) Acquisition of entrepreneurial skills is not significant in insecurity reduction in Nigeria. Survey Research Method was adopted for the study and a questionnaire titled ‘Entrepreneurial Skills and Insecurity Reduction Questionnaire’ (ESINRQ) was employed for data collection. The population of the study consisted of 300 academic and non-academic staff from three Nigerian universities. Purposive sampling technique was used to compose the sample with 100 staff selected from each university. The staff were also stratified into status and faculty. A test-retest method after an interval of three weeks and the use of Pearson Product moment correlation statistics, were employed to obtain reliability co-efficient of 0.75. Scoring was based on a Likert type scale of strongly agree, agree, disagree and strongly disagree, while the score of 4,3,2,1 was applied respectively from strongly agree to strongly disagree. Data were analyzed using frequency count, percentage, mean score and mean ranking were used particularly to answer the research questions presented in tables 1-3, the hypotheses were tested using the t-test and analysis of variance (ANOVA) where applicable. According to (Itassan, 1998 & Adana, 1996), the t-test statistical tool as a parametric test is often used to compare the means of two groups. ANOVA statistics is appropriate for use when the researcher is dealing with more than two independent groups. From the summary of the results of the study, the causes of insecurity in Nigeria include poor parental upbringing, parents as negative role models, the get-rich quick syndrome in Nigeria, IN-fighting among political rival, high level of poverty, inability to obtain gainful employment, drop out syndrome, visiting internet sites which show youths doing violent exploits, desire to be recognized and respected by peers among others. Findings also show the requisite skills needed for entrepreneurial occupation to be communication skills, negotiating skills, leadership skills, integrity and reputation for honesty and sales
skilled. Results further revealed the contributions in Entrepreneurial skills training in insecurity reduction to be: skilled entrepreneurs can go into mass production of anti bomb detector and information techniques to help detect or even block communication among perpetrators of insecurity, by reducing unemployment since it contributes to the spate of insecurity, economic empowerment of the youths and that it enhances production of high quality goods and services. The null hypothesis one showed no significant difference among workers in the three selected Nigerian universities with respect to their views on the causes of insecurity in Nigeria. Again hypothesis revealed that acquisition of entrepreneurial skills training is significant in creating employment for youths and reducing insecurity. Based on the findings, the researcher thereby concludes that acquisition of entrepreneurial training skills is a solution to insecurity problem in Nigeria. This is because for lives and property to be saved within the country youths should be gainfully employed. Entrepreneurship is a solution to unemployment as has been revealed by the study. People will be job creators rather than job seeker in the end. It is therefore recommended that government should de-emphasize paper qualification and introduce more viable programmes that foster entrepreneurship. Again most of the ailing industries especially the ones that have many indigenous skilled professionals should be revitalized. This will not only solve the problem of joblessness in the country, it will drive crimes away from the streets thereby making the country safe to live in. thus reducing both economic insecurity and social insecurity. In addition school counsellors have big tasks at hand based on the findings of the study. Counsellors in each states of the federation should organize regular workshops, meeting and events with local authorities, youths, and community members for national peace enhancement.
INTERPERSONAL BENEFITS OF OPTIMISTIC EXPECTATIONS: OVERRIDING NEGATIVE RESPONSES TO PARTNER WITHDRAWAL?

Optimism can be seen as an enduring strength in marriage. It provides spouses with a broader and more flexible range of behavioral options and helps them to successfully navigate stressful situations. Optimism is characterized by a positive attitude toward the future and by positive expectations. While a positive attitude toward the future may benefit adaptation, merely holding positive expectations may lead to disappointment and inflexible responding to daily challenges. Using questionnaires and diaries from 103 couples, this study examines how spouses respond to situations where the partner prefers being alone at the end of a workday. We investigated whether and how optimism, and two components of positive expectations, the overall level of and the flexibility, shape these responses. Findings showed that perceived partner withdrawal was associated with less positive and more negative reported behaviors. Optimism buffered this effect above and beyond the effect of positive expectations. Expectation levels indicated no buffering and even a tendency to more negative and less positive reactions. Finally, and unexpectedly, expectation flexibility had no effect on partners’ reported negative behaviors, and was even associated with less positive reported responses to the partner’s withdrawal. Implications for the theoretical understanding of optimism and expectations, as well as for intervention, will be discussed.
O264
YOUTH PERSONAL ACTIVITY MANIFESTATION IN SOCIAL NETWORKS AND REAL LIFE

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Tatiana Pilishvili, Peoples' Friendship University of Russia, Moscow - Russian Federation

The study is devoted to the personal activity manifestation in cyberspace (evidence from social networks) and real life. It was conducted on the basis of Peoples' Friendship University of Russia, Moscow. 218 Russian students, 17-23 years old were engaged. There were used the content analysis of social network activity and the following Russian adapted techniques: “Life orientations”, Leontiev D.A.; “Self-determination”, Sheldon B.; “Psychological well-being scales”, Rieff K.; “Life satisfaction index”, Panina N.V.; “Success and failure explanation style”, Gordeeva, T.S.; “Strategies of interior behavior in conflict situations”, Fetiskin N.P.; “Diagnostics of personal interactive orientation”, Schurkova N.E.; “Satisfaction with quality of life level”, Vodopyanova N.E.; “The type of behavioral activity”, Wasserman L., Gumenuk N.V.; “The level of aspiration”, Gorbachevski V.K.; “The inventory of activity in social networks”, Ivaschenko A.V., Pilishvili T.S. Studying the relationship between students activity self-esteem in social networks, the number of registered profiles as well as the amount of time spent online per day, we’ve obtained results, according to which feeling of satisfaction with own activity can’t be the only quantitative variable. The productivity depends rather on the user’s activity who produces something in social networks to change his life in objective reality, so on concrete efforts in cyberspace and productive activity in meatspace for actual well-being.

ACTION ANTICIPATION BASED ON DESIRES, BELIEFS AND FALSE BELIEFS: DIFFERENCE BETWEEN IMPLICIT AND EXPLICIT EXPRESSIONS

B07. Development and education - Social cognition, identity and social interactions
Evren Etel, University of Queensland, Brisbane - Australia
Virginia Slaughter, University of Queensland, Brisbane - Australia

Action anticipation is a critical ability to make social interaction functional. This ability is defined within Theory of Mind (ToM). Recent studies have shown two expressions of action anticipation: Implicit and explicit. However, whether the implicit expression of action anticipation indicates an understanding of behaviour or understanding of mental states is a debate. Recent studies show evidence supporting the proposal that there is an early-developing implicit ToM process that may or may not be continuous with later-developing explicit ToM. However, only false belief understanding has been assessed with implicit tasks. On the other hand, studies of explicit ToM have moved beyond assessing ToM with false belief understanding, through the development of a ToM scale to examine a series of ToM acquisitions comprehensively (Wellman & Liu, 2004). This study aimed to develop an iToM scale, modelled on Wellman and Liu’s explicit ToM scale. These tasks were designed to measure implicit understanding of the first three steps of Wellman and Liu’s developmental scale, including diverse desires, diverse beliefs, and false belief. Three ToM tasks including implicit and explicit versions were administered to 30 three-year-old children. The preliminary results indicated that, although children did not show difference between implicit and explicit ToM task performances, a gradual developmental pattern was found in implicit performances, similar to explicit performances. Findings are discussed in the framework of theoretical debate on what these implicit performances indicate.
Despite the numerous studies and interventions that have been conducted in the effort to improve women’s sexual health, little has been done to understand sexuality from a female-centred perspective. Feminist critique of gender inequality highlights how the production of male power is prevalent within heterosexual relationships. Dating and intimate relationships among young people has been an area sparsely explored in South Africa. Therefore, there is a need to explore how young people, specifically in this case, young women negotiate dating and intimate relationships. Understanding how young women negotiate dating and intimate relationships may enable us to get an insight into some of the dynamics that shape such relationships. Research on intimate relationships among young people in South Africa has mostly focused on exploring aspects of gender relations, violence within intimate relationships, HIV/AIDS and related sexual behaviours and risks. Using a critical feminist lens, the study aimed to explore how young South African women navigate their space, position themselves in their intimate relationships, construct themselves as sexual beings and negotiate dating and intimate relationships. Two conversation groups discussing young women’s relationships with men were conducted, and discourse analysis was used to analyse how the women construct relationships with men, the sexual identities they work up, and the cultural resources they draw upon in so doing. The paper will provide the preliminary finding of the study.

SPESIS: A NEW SCALE FOR THE EXISTENTIAL DAMAGE ASSESSMENT

C11. Culture and society - Forensic psychology and law

Sara Pezzuolo, Court Consultant, Milano, Montepulciano - Italy
Marco Samory, Court Consultant, Padova – Italy
Daniele Berto, ASL Padova 16, Padova – Italy
Michela Veronese, ASL Padova 16, Padova - Italy

Existential damage is a new claim within Italian civil courts. However, the quantification is extremely difficult because of the lack of indicators and tools. The “Existential Damage Scale- Scala di Valutazione per il Pregiudizio Esistenziale” (SPESis) has the aim to measure such damage allowing the judges to comply with the “compensation”. SPESis is a 79-items scale that analyses 5 areas and it permits to obtain a differentiated profile depending on the damaged area. The SPESis has also two scales to detect attempts of fake or exaggeration of the damage. SPESis was submitted to a wide sample (n=340) split into 3 groups (Damaged, Faked and Control); reliability and validity result to fit. KR20 index is more than .90 in each group. Item analysis confirms the internal consistency of the scales. A hierarchical confirmatory factor analysis verifies the construct validity. The statistical indexes confirm the goodness of the model (CFI and TLI>.90 and RMSEA<.05). Scoring and transformation of the raw scores into percentile ranks and T points are very easy. The SPESis can be used in civil and penal trials, even with a biological damage in trial and non-trial stage. It gives an immediate and reliable image of the existential damage, pointing out fake or doubtful profiles. SPESis advantages are the shortness and the accessibility for a wide population (for ages 16-78). The SPESis is the only one tool created for the assessment and the evaluation of the existential damage component.
O285
ROLE OF RELATIONSHIPS WITH OTHERS AND SELF-EFFICACY ON E-LEARNERS’ COMMITMENT

F10. EXPO 2015 Hot Topics - Psychotechnologies and life-long learning

Emilie Vayre, University Paris Ouest Nanterre la Défense, Paris - France
Anne-Marie Vonthron, Université Paris Ouest Nanterre la Défense, Paris – France

In the last decade in France, e-learning has progressively spread through universities structures. In spite of this growth, high dropout and failure rates have been of concern to many higher education institutions (Park & Choi, 2009). According to Oncu and Cakir (2011), to improve online learning effectiveness, research must deepen the study of e-learners’ engagement. Empirical studies have shown that relationships with others and self-efficacy are significant predictors of training commitment, in both face-to-face and online learning programs (e.g. Fredricks & al., 2004; Paechter, & al., 2010;...). Subsequently, the purpose of this study is to test a model of e-learners’ commitment integrating social support (from teachers, peers and family members) and sense of community as direct and indirect factors; training self-efficacy playing a mediator role. Survey results based on a questionnaire administered to 255 students enrolled in an online French university course, confirm but only partially our hypothesized model. Path analysis revealed that teachers are the only source of social support that significantly promotes e-learners’ commitment. Moreover, sense of community exerts a positive but indirect influence on students’ commitment; self-efficacy functioning as a mediator. Finally, the study findings shed light on how we can foster students’ commitment in online courses, which is a meaningful factor affecting e-learners’ academic achievement and retention (Hu & Hui, 2012).

COMPREHENSIVE AND BRIEF MEASURES OF HOPE FOR RESEARCH AND PRACTICE

E02. Health and clinical intervention – Psychodiagnosis

Anthony Scioli, Keene State College, Keene - United States

Background: Scioli and colleagues (Scioli, 2007; Scioli & Biller, 2009) have introduced an integrative theory of hope, focusing on mastery, attachment, survival, and spirituality. In conjunction with this work, Scioli et al. (2011) have derived comprehensive measures of state (40 items) and trait hope (56 items). In the present research, briefer measures of state hope were derived to serve the diverse needs of researchers and practitioners (2 parallel 20-item forms, and a 10-item rapid screen). Methods and Results: To establish the reliability, and freedom from distortion (social desirability, age, gender, SES) of 3 brief hope measures, 525 internet participants were used (125 males; 403 females), 16 to 85 yrs. (M = 38.39; SD = 14.53). Alpha values ranged from .84 to .87. Freedom from distortion was evident for all 3 measures (all p and t values were > .05): (Eysenck Lie Scale correlations ranged from .05 to .06; for age, r values were between .04 and .06; there no gender differences; for SES, the r values fell between .01 and .02). For validation purposes, clinical and nonclinical samples were used. In young adults, all 3 measures demonstrated adequate validity, correlating positively with standard measures of meaning and spirituality as well as willingness to enter psychotherapy, and inversely with loneliness, anxiety, and depression. In a clinical sample, all 3 measures were inversely correlated with clinician ratings on the Hamilton Scale for Depression.
Background: A positive link between hope and physical health has long been suspected. However, there is scant empirical research to support this claim. Drawing on an integrative theory of hope (Scioli, 2007; Scioli & Biller, 2009), 4 studies were conducted to assess the impact of hope on physical health and healing.

Methods and Results: In studies 1-3, an integrative trait hope scale was used (Scioli et al., 2011). In study 1, the integrative hope measure was linked to a broader array of health habits as compared to a standard goal-oriented measure of hope (Snyder et al., 1991). In a step-wise regression, the integrative approach to hope was retained and the goal-oriented measure was excluded as a predictor of a composite health habits index. In study 2, greater trait hope was associated with depth of commitment (more advanced stages of change) to a healthier diet and increased exercise. In study 3 higher scores on the integrative trait hope measure were predictive of non-progression of HIV (higher CD4 blood levels) over a 4 year period. In study 4, a content analysis of hope themes in public testimonies of long-term breast cancer survivors revealed a strong reliance on attachment and spirituality, dimensions typically ignored in psychological studies of hope. A fuller conception of hope provides a framework for further research on emotion and health as well as a foundation for developing positive interventions to foster greater health and healing.
O294

VIOLENT RESPONSE TO INSULT: EXPERIMENTAL EXAMINATION OF THE CULTURE OF HONOR IN TURKEY

C06. Culture and society - Attitudes and values

Veysel Mehmet Elgin, Abant Izzet Baysal University, Bolu - Turkey

Honor is a central value in the honor cultures that are generally seen in the Mediterranean, Latin America, and the Southern United States. As a Mediterranean country, Turkey also possesses the culture of honor (COH). Although COH is a significant cultural syndrome for understanding the psychological processes of the members of the honor cultures, it is a relatively new area that has been studied by the social psychologists after the initial studies conducted by the anthropologists and sociologists. Generally speaking, honor refers the reputation of the person, which one does not hesitate to protect it all costs. In this regard, people are hypersensitive to insults in COH, and accordingly, violent response to insult is a general characteristic of COH. Current study is the first experimental study examining COH in Turkey. Eighty four (n = 84) male university students from the two regions of Turkey (i.e., Eastern Turkey and Western Turkey) participated in this study. While half of the participants were exposed to a subtle insult, the other half was not exposed to the insult. Then as the measure of violent response to insult, their responses on a word completion task were examined. The ANOVA results indicated that the endorsement of COH in Turkey is prevalent. It is believed that the findings will shed light on the COH literature in general. All the findings of the current study and the suggestions for the future studies will be discussed on the basis of the literature.
Cognitive models of psychopathology suggest that negatively biased thinking styles are involved in the development and maintenance of emotional disturbances. Even though there is evidence for the existence of cognitive errors in youth in the United States and Greece, this has not been examined to date in Aotearoa New Zealand. The present study investigated the extent to which cognitive errors were exhibited by New Zealand youth and the interrelationships between cognitive errors, anxiety and depression. A community sample of adolescents aged 16 to 18 years from secondary schools within the Wellington region completed an online survey, consisting of the Children’s Negative Cognitive Error Questionnaire and self report measures of anxiety and depression. Initial results of the first 118 cases indicated that cognitive errors were significantly related to greater levels of symptoms of anxiety and depression. These findings suggest that cognitive errors are a common and pervasive attribute of adolescents who reported anxious and/or depressive symptoms and demonstrated the generalizability of the association between cognitive distortions and anxiety and depression in New Zealand. Final results of this investigation are expected to increase understanding and inform the design of treatment interventions, as well as, educational interventions for anxiety and depressive disorders in New Zealand youth.
O297
SUCCESSFUL AGING IN THE WORKPLACE AND ORGANIZATIONAL CITIZENSHIP BEHAVIORS AMONG OLDER WORKERS IN HONG KONG

D13. Work and organization - Age and work

Yue Lok Cheung, Lingnan University, Hong Kong - Hong Kong
Dannii Y. L. Yeung, City University of Hong Kong, Hong Kong - Hong Kong
Anise M. S. Wu, University of Macau, Macau - Macau

Global workforce is experiencing demographic aging. Thus, understanding factors that support successful aging and its impact on occupational well-being become an important research agenda. For instance, earlier studies suggest that older workers who experience successful aging in the workplace have lower intention to leave the organization. In this study, we aim to extend this line of research by exploring whether successful aging at the workplace is related to organizational citizenship behaviors, an important form of contextual performance in the workplace. This study is a self-administrated questionnaire survey. 350 currently employed Chinese workers in Hong Kong who aged 45 years or over were recruited. Among them, 129 were male and 220 were female (one participant did not declare the gender identity). The average age was 51.88 (SD = 5.15). Correlation showed that all successfully aging in workplace dimensions (i.e. adaptability and health, occupational growth, positive relationship with coworkers, sense of personal security and continued focus of work goal) were significantly related to the two dimensions of organizational citizenship behaviors, namely organizational citizenship behavior-individual (OCBI, r ranged from .28 to .42, app p<.01) and organizational citizenship behavior-organization (OCBO, r ranged from .26 to .39, all p<.01). Hierarchical regression showed that occupational growth was a significant predictor of both OCBI and OCBO. Strategies will be discussed to enhance successful aging in the workplace during the presentation.
O301
PROCESS EVALUATION OF ONLINE PESTKOPPENSTOPPEN, AN ONLINE TAILORED ADVICE FOR CYBERBULLYING VICTIMS

B08. Development and education - Bullying and aggression

Niels Jacobs, Open University of the Netherlands, Heerlen - Netherlands

Online Pestkoppenstoppen is an online tailored advice for cyberbullying victims that are starting to attend secondary vocational education. The intervention is developed based on theory, scientific evidence, and recommendations of the target group. These recommendations, as well as process information (i.e. focus group interviews, questionnaires and website usage statistics) will be discussed in this presentation. More specifically, the following questions will be answered: How many/which adolescents participated? Why do participants or schools withdraw from participation? Which recommendations/experiences do participants have? How do they judge the intervention (quantitative/qualitative)? Almost 6000 adolescents (44 schools) were invited, 361 started with the research. The most important results were: (1) schools/participants see the intervention as really positive and useful; (2) participants judged the questionnaires attached to this study as too long and time consuming; (3) success of including schools and participants depends on the timing and process of recruiting (two methods); (4) success of the research depends on the instructions (at school/in information letters); (5) the online enrollment was perceived as being complex; and (6) a combination of questions and advices is preferred. The results of this study lead to several recommendations that need to be taken into account when conducting online research with this research population.
O303
EMOTIONS ASSOCIATED WITH EARTHQUAKES TWO YEARS LATER: THE ROLE OF PERSONAL EXPERIENCE AND AGE FOR PRIMARY SCHOOL CHILDREN

Daniela Raccanello, University of Verona, Verona - Italy
Maria Cappello, University of Verona, Verona – Italy
Diletta Caprara, University of Verona, Verona - Italy
Paola Cavazza, University of Verona, Verona – Italy
Fabiana Mazzola, University of Verona, Verona - Italy
Lorenzo Facco, TERR.A.IN. snc, Vicenza – Italy

While long-term disadvantageous consequences of experiencing natural disasters for mental health are well documented, less is known on how emotional representations of such events are influenced, especially for children. We explored the role of personal experience and age for primary school children’s emotions associated with earthquakes, after two years. We hypothesized that emotional richness was higher for children who experienced them and with age. We involved 127 second- and fifth-graders, who were living next to the epicentre of the 2012 Emilia Romagna earthquake (experimental group) or about 80 kilometres far (control group) when it happened. We proposed a semi-structured interview, focused on knowledge of earthquakes and associated emotions, and a task on the intensity of 4 negative emotions. We also measured emotional understanding and regulation abilities, not differing in the two groups. Analyses of variance revealed that the number of emotional terms and variety of their antecedents (natural, biological, human technological, human non-technological, affective, and cognitive) spontaneously reported was higher for the experimental group for older children. Intensity of fear, anxiety, sadness, and anger was higher for the experimental group at all ages. Notwithstanding limitations, we documented the role played by personal experience of natural disasters in shaping children’s later emotional representations, with useful hints for prevention at an applied level.
O305
IMPACT OF UNIVERSITY STUDENTS’ USE OF SOCIAL MEDIA ON THEIR LEVEL OF LONELINESS AND ANXIETY

B02. Development and education - School adjustment, academic achievement and learning disabilities

Latife Utaş Akhan, Bulent Ecevit University, Zonguldak - Turkey

Along with the many conveniences introduced into our lives by use of the computer and internet, there are also many problems associated with the excessively frequent use of them. According to Rehm, the internet is a means for individuals to redefine themselves both individually and socially in several aspects including among others education, health, child development, dialogue, intercommunication, self-fulfillment, but can also be the cause of reduced social communication as well as social deviations. The longer time the internet is used, the less enter the users into relationship with people in social life; which may result in “social isolation”. This research was carried out in the form of a descriptive study aimed to identify the impact of university students’ use of social media on their level of loneliness and anxiety. The universe of research consisted of 754 students of a state university, willing to participate in research. In the personal data sheet developed for the purpose of data gathering, the researchers made use of the Beck Anxiety Inventory and UCLA Loneliness Scale. The researchers obtained written permits form the state university’s ethics committee as well as written and verbal consent forms from participating students. The results revealed that 65.1% of the participants had an own personal computer, 60.7% had a Facebook account, 14.5% a Twitter account, 37.4% spent 1-2 hours on the computer, while 18.6% spent 3-4 hours; and that 31.6% used the internet to get information, 11% to get socialized/establish friendships, 27.6% to get rid of boredom, and 32.2% to engage in conversation. The loneliness level of students making use of social media 8 hours a day or more, the anxiety level of students making use of social media almost never/only once in a month or those staying with their relatives, and the anxiety and loneliness level of those at an age of 31 and more have been found to be high.
O309
DISTINCTIVE GENDER CHARACTERISTICS OF SELF-EFFICACY OF HEADS OF UKRAINIAN EDUCATIONAL ORGANIZATIONS

D02. Work and organization - Leadership and entrepreneurship

Olena Bondarchuk, University of Educational Management, Kiev – Ukraine

Objectives. To find out distinctive gender characteristics of self-efficacy of heads of Ukrainian educational organizations. Theoretical bases. The theory of self-efficacy (A.Bandura, J.E.Maddux, M.Sherer etc); Career dynamics (E.Schein, D.E.Super, J.L.Holland etc); The social psychology of gender (S.Bem, S.M.Burn etc); Psychology of management in education (L.M.Karamushka, N.L.Kolominsky etc. Results. The following research instruments have been used: a) M.Sherer et J.E.Maddux’s General Self-Efficacy Scale (modified by A.Boyarintseva); b) a projective instrument of a free description of a successful manager’s life (O.Bondarchuk). The obtained data were analyzed using correlation analysis, ANOVA (SPSS-21.0). The sample included 482 heads of educational organizations (51.7% - females and 48.3% - males) from different regions of Ukraine. The highest self-efficacy was shown to be both in men- and women-heads of educational organizations who were oriented towards self-realization in all spheres of life. However, men, unlike women, were more oriented towards vertical careers thus having higher self-efficacy (p<0.05). It should be noted that with age this trend became stronger. Conclusion. The investigation findings can be used in developing Ukrainian educational organization heads’ self-efficacy by means of special training courses based on trainees’ gender differences. This can be effectively done in the system of post-graduate pedagogical training, in particular in refresher training.
RESEARCH OF PSYCHOLOGICAL CHARACTERISTICS OF DOMINANT TYPES OF UNIVERSITY ORGANIZATIONAL CULTURE AS PERCEIVED BY STUDENTS

D12. Work and organization - Safety culture and climate

Olga Ishchuk, Zaporizhzhya National University, Zaporizhzhya – Ukraine

The effectiveness of university training depends on a number of factors among which universities’ organizational culture sometimes plays a leading role. Objective: to analyze the characteristics of students’ perceptions of the dominant types of organizational culture of their universities. Methods. The investigation was done on a sample of 619 students of universities of different ownership forms in different regions of Ukraine using the Organizational Culture Assessment Instrument (OCAI) by K.Cameron and R.Quinn. Results. The study found that 38.3% and 32.2% of the students from state-owned universities viewed the clan and market types of organizational culture respectively to be dominant in their universities. However the clan type of organizational culture was shown to be dominant in 70.3% of private universities. The students from the state-owned universities in contrast to those from the private ones had inconsistent ideas about the key elements of organizational culture that included management type, HR management, strategic objectives, efficiency criteria, and key ties. Conclusion. The inconsistency of students’ ideas about the key elements of organizational culture has negative effects on students’ understanding of their role in the development of universities and on students’ organizational behaviors in general. The investigation findings can be helpful in counseling university heads and students as well as in training courses on matters of organizational culture.
A COUNTERBALANCED COMPARISON STUDY OF A TIME-CONTINGENT SMARTPHONE APPLICATION AND AN EVENT-CONTINGENT ESTIMATED SNACK DIARY

E11. Health and clinical intervention - Lifestyles and healthy self-regulation

Nele Jacobs, Open University of the Netherlands, Heerlen - Netherlands
Saskia Wouters, Open University of the Netherlands, Heerlen – Netherlands
Viviane Thewissen, Open University of the Netherlands, Heerlen – Netherlands
Mira Duif, Open University of the Netherlands, Heerlen – Netherlands
Lilian Lechner, Open University of the Netherlands, Heerlen – Netherlands

Between-meal snacking is a key risk factor for overweight. The aim of this study is to validate momentary energy intake as measured by the Snackimpuls app, a smartphone application based on the Experience Sampling Method. In a counterbalanced design participants (n=46; age 20-50) reported snack intake during four days with Snackimpuls and during four days with an estimated snack diary. To investigate whether Snackimpuls and the snack diary were comparable on momentary energy intake (Kcal) a multilevel regression analysis was conducted. A mixed Anova Latin square analysis was used to assess differential transfer. Results showed no significant differences between the app and the snack diary (β = 11.84, SE = 8.03, p > 0.05). A mixed design Anova Latin square analysis showed no differential transfer (F(1,44) = 3.29, p =.077). This study demonstrates satisfactory validity of the Snackimpuls app to assess momentary energy intake. The Snackimpuls app is a suitable instrument to assess dynamic psychological processes related to between-meal snacking behavior.
O314
FACTORS OF INDUSTRIAL COMPANY PERSONNEL’S ENGAGEMENT

Iuliia Paskevska, Zaporizhzhya National University, Zaporizhzhya – Ukraine

An important area of organizational development especially during organizational change is formation of personnel’s engagement (L.Joell, G.S.Nikiforov, L.G.Pochebut, A.L.Sventsitsky, V.O.Chiker, E.Schein and others). Objective: to analyze factors of industrial company personnel’s engagement. Methods. The investigation was conducted on a sample of 850 managers and management employees of different structural units of industrial companies using Satisfaction with Contents and Fulfillment of Collective Contract questionnaire (Yu.Paskevska) and Personnel’s Work Satisfaction questionnaire (Yu.Paskevska). Analysis of the results was carried out using the factors matrix for satisfaction, loyalty, and engagement. Results. There were identified the following groups of factors that affected personnel’s engagement (p<0.05): a) satisfaction, positive factors: inter-personal relationships, professional growth, information and communications, social policy; negative factors: working conditions, career development, incentive system; b) loyalty, positive factors: willingness to put in extra effort to carry out tasks, willingness to spread positive information about the company; negative factors not identified, etc. Conclusions. The investigation found the main factors of industrial company personnel’s engagement which can be taken into account when promoting organizational development.
The nature of organizational culture and its components have been studied by western (K.Cameron, I.Ladanov, Ch. Handy etc.) and Ukrainian (O.Ishchuk, A.Shevchenko, I.Snyadanko etc.) researchers. However, some psychological factors that influence organizational culture, in particular educational organization staff's tolerance, lack adequate research. Objective: to analyze the relationship between staff’s tolerance and organizational culture in educational organizations. Method. The instruments used included G.Soldatova Tolerance Index and I.Ladanov Evaluation of Organizational Culture. The sample was made up of 306 heads and staff of secondary schools of traditional (42.5%) and innovative (57.5%) types from Ukraine. Results. The investigation found only 30.4% of the respondents to have high level of overall tolerance index. Staff’s tolerance index positively correlated with the following components of organizational culture: work (rs=0.139, ρ<0.05), communication (rs=0.144, ρ<0.05), management (rs=0.133, ρ<0.05), motivation and morality (rs=0.157, ρ<0.05). We also analyzed the associations between different types of staff’s tolerance (ethnic, social and personal tolerances) and components of organizational culture in educational organizations. Conclusion. The study found positive correlations between staff’s tolerance and components of organizational culture in educational organizations. The obtained findings can be helpful for more effective work of educational organizations.
O323
PREDICTIVE POWER OF DRIVER'S TIME PERSPECTIVE AND DRIVING SKILLS ON ACTIVE-YOUNG DRIVER BEHAVIORS

D10. Work and organization - Traffic and transportation

Fatih Ozdemir, Middle East Technical University, Ankara - Turkey
Burcu Tekes, Isik University, Middle East Technical University, Istanbul - Turkey

The purpose of the study was to predict active-young driver behaviors (including driving errors and violations) with driver's time perspective as past negative, past positive, present fatalistic, present hedonistic and future time perspectives, and driving skills which include perceptual-motor driving abilities, knowledge and safety skills. Also, the effect of sex, age, education, driving experience, number of accident, average speed, and overtaking ratio of driver on driving behaviors were tested. 203 active-young vehicle drivers ( = 107; = 96) who use their vehicle least 1000 km at year, participated in this study ( = 25.36; SD = 3.09), and completed Driver Behavior Questionnaire (Reason et al., 1990), Driver Skill Inventory (Lajunen & Summala, 1995) and Zimbardo Time Perspective Inventory (Zimbardo & Boyd, 1999). Canonical correlation analysis indicated a systematic association between driver's time perspective and driving skills-behaviors. Also, the relationship between time perspective and driving behaviors was significantly mediated by driving skills. Present hedonistic time perspective leads to stronger driving skills which in turn increases violation; past positive and future time perspectives support safety skills which in turn decreases violation; both past negative and present fatalistic time perspectives lead to weaker safety skills which in turn increases violation, and past negative time perspective also raises error in traffic.
THE RELATIONSHIP BETWEEN ATTACHMENT AND SOCIAL INTELLIGENCE: THE MEDIATOR ROLE OF NEGATIVE MOOD REGULATION

INTRODUCTION: Attachment which is necessary for a person to meet the physical, emotional and social needs, provides the strong relationship with at least one person. When the literature is examined, attachment is from the perspective of negative mood regulation theory. From this standpoint, attachment is considered to have a correlation with social intelligence due to the effect on interpersonal relationships. AIM: The aim of the present study will investigate correlation between attachment, negative mood regulation and social intelligence. Attachment will examined by both categorical and anxiety with avoidance dimensions. The role of negative mood regulation expectancies between attachment and social intelligence will also be examined.

METHOD: A sample of 200 university students will complete the questionnaires including the Experiences in Close Relationships–Revised (ECR-R), Negative Mood Regulation Scale-NMR, The Tromso Social Intelligence Scale-TSIS.

EXPECTED RESULTS: We expect that there will be significant correlations between attachment, negative mood regulation expectancies and social intelligence. Direct and indirect effects by negative mood regulation of attachment on social intelligence will be expected.

CONCLUSION: In present study, we expect that the person who has a secure attachment will have higher mood regulation and social intelligence than those who have insecure attachment. Negative mood regulation will be mediator between attachment and social intelligence.
A PRELIMINARY STUDY ON THE EFFECTS OF MENOPAUSE ON FEMALE MENTAL HEALTH AND ITS CORRELATES

Elvan Kiremitci, Abant Izzet Baysal University, Bolu - Turkey
Zehra Yasin Dokmen, Ankara University, Ankara - Turkey

INTRODUCTION: Increasing lifespan and availability of health-care led to women living approximately 1/3 of their lifespan after the onset of climacterium. Menopause causes wide ranging changes in biological, endocrinological and psychological makeup of women. AIMS: This study aimed to evaluate the effects of menopause on mental health of Turkish women and its correlates. METHODS: The sample consisted of 190 women, 59.5% of which were not in menopause. The subjects were evaluated with a Socio-demographic form developed by the investigators and Brief Symptom Inventory (BSI). Student’s t test for independent groups and Pearson correlation were used in analyses. RESULTS: Premenopausal and postmenopausal Turkish women in our sample differed only in their scores for the Somatization subscale. When bivariate correlation analyses were undertaken for age and subscale scores for the menopause group, it was observed that age had a significant correlation with Somatization scores. DISCUSSION: According to our results premenopausal and postmenopausal Turkish women differed significantly only in their somatization scores and those scores showed a significant positive correlation with age in the postmenopause sample. It may be argued that rather than the stage of menopause, age and socio-cultural variables affect the psychological health of Turkish women after menopause. CONCLUSION: Our results should be replicated with further studies on larger and more hetero-genous samples.
The present study developed a paper-and-pencil version of the Implicit Association Test (PP-IAT) to measure antisocial attitudes based on the Single Category IAT (SC-IAT; Karpinski & Steinman, 2006) as a convenient assessment tool for use in detention and correctional facilities. Concurrent and predictive validity were evaluated by correlations with the computer-based version SC-IAT and explicit measures of antisocial cognitive biases. The participants were 108 undergraduates (Mage = 19.36, SD = 0.64; 43 males and 65 females). After completing the SC-IAT, participants completed questionnaires, including the PP-IAT, according to taped instructions controlling the response time. Antisocial cognitive biases were measured by normative beliefs about aggression and cognitive distortion scales, including respondents' past experiences of delinquent behaviors. Correlation analyses revealed that concurrent validity with the SC-IAT was not confirmed for the SC-IAT score, but correlations with positive-antisocial and negative-antisocial associations were significant. As for predictive validity, positive-antisocial associations predicted cognitive distortion and delinquent behaviors for males. These findings provided evidence that the PP-IAT had moderate criterion-related validity. These results may have been affected by the low level of antisocial behaviors in this sample; future research should target junior high school and delinquent populations.
THE RELATIONSHIP BETWEEN MIND WANDERING AND DANGEROUS DRIVING BEHAVIOR AMONG CHINESE DRIVERS

Although mind wandering as a cognitive distraction is universal in our daily driving, very few studies have focused on the impact of mind wandering on driving behavior. In this study, the relationship between mind wandering during everyday life and dangerous driving behavior was investigated. 295 drivers completed the Mind Wandering scale (MW), the Dula Dangerous Driving Index (DDDI), and Demographic questionnaire. The results showed that the frequency of mind wandering was positively correlated with risky driving, aggressive driving, negative cognitive/emotional driving and drunk driving as measured by the DDDI. In addition, drivers’ mind wandering was also positively correlated with self-reported traffic accidents, penalty points and fines. Moreover, the interaction effects of mind wandering and gender on dangerous driving behavior were also explored. In the high mind wandering group, male drivers reported more risky and negative emotional driving behaviors than did female drivers, but there were no significant differences in the middle and low mind wandering groups. Also, male drivers reported more penalty points and fines, but were involved in fewer accidents than were female drivers. These results present considerable implications for road safety and strategies for self-regulation of mind wandering.
O333
MONITORING AND REGULATION OF EMOTION MODULATES AFFECTIVE INFLUENCE ON INTERFERENCE RESOLUTION IN WORKING MEMORY

A11. General issues and basic processes - Motivation and emotion

Thomas Maran, University of Innsbruck, Innsbruck - Austria
Pierre Sachse, University of Innsbruck, Innsbruck - Austria
Marco Furtner, University of Innsbruck, Innsbruck - Austria

The „dual competition“ framework (Pessoa, 2009) proposes that motivation impacts both perceptual competition and executive control. Sensory enhancement leads to an increased perceptual and memory vividness of pleasant and unpleasant, high arousing stimuli. Through this prioritization of biological relevant information such stimuli get enhanced access to executive functions in working memory. Although several studies focused on the influence of threat on working memory processes, there is little evidence on the effect of motivational states as hunger and sexual drive. The current study aimed to understand the impact of motivational significance on executive functioning using a modified recency-probes paradigm including IAPS-pictures of humans in neutral scenes and erotic couples. Our results showed that rewarding stimuli as erotic pictures improve reaction times compared with neutral scenes when participants had to respond on recency probes that caused interference in visual working memory. This facilitation effect covaried with scores on the Trait Meta-Mood Scale. Overall our findings suggest that motivational significance facilitates interference resolution in visual working memory. Furthermore this effect is strongly related on the ability to monitor and regulate one's own emotion. Individuals who seem to be good at repairing negative moods show reduced interference for high arousing stimuli in working memory.
O334
PSYCHOSOCIAL CORRELATES OF ERECTILE DISORDER IN PAKISTAN

C03. Culture and society - Sex and gender

Hidna Iqbal, University of the Punjab, Lahore - Pakistan
Nashi Khan, University of the Punjab, Lahore – Pakistan

The present study aimed to explore the demographic, social and psychological factors of men with Erectile Disorder who were seeking treatment for this disorder from different health professionals in Pakistan. A Structured Interview was used to probe demographic, interpersonal, marital/sexual, health and treatment related areas of the participants. International Index of Erectile Function was used to assess erectile functioning in the sample. A total of 109 men from outpatient clinics of different health professionals were recruited who fulfilled the ICD 10 and DSM V criteria of Erectile Disorder. The results revealed that most of the men were seeking herbal treatment, had a mean age of 33 years, educated up to matriculation, were married, living in joint family system and had a sedentary lifestyle. Most of them reported to have moderately to highly conservative home atmosphere and strict parenting in childhood. The strongest predictors of Erectile Disorder were strained relationship with wife/partner and father, less interest in sex, drug abuse before Erectile Disorder and dissatisfaction with sexual life. The men reported substantial implications of this disorder on their psychological wellbeing so there is a need to cater the psychosocial factors in devising treatment plan for men having this problem.
FAMILY CAREER COMPASS – EFFICIENT CAREER GUIDANCE APPROACHES SUPPORTING PARENTS IN GUIDING THEIR CHILDREN’S VOCATIONAL CAREER

Anna Paszkowska-Rogacz, Academy of Social Sciences, Lodz - Poland

It is an undeniable fact that parents play a crucial role in planning their children’s future professional career, with that influence either being positive or negative. Furthermore, according to Paszkowska-Rogacz (2011) 98% of parents consider the choice of their children’s profession a very important issue, while pupils refer to their parents as to personal counselors. At the same time, parents consider themselves being excluded from the process of personal counseling to their children. Finally, the Copenhagen Declaration on enhanced European cooperation in VET also refers to the importance of guidance and counseling in EU Member States at all levels of education, while there are no training courses for counselors available in the market that would support career orientation for parents. The presentation will show results of the project FAMICO (Family Career Compass) which is addressed for career counselors broadening their competences, in guiding parents to support children’s career decision making process. Main products of the project are: a handbook for counsellors, a guidebook for parents, thematic communicational platform addressed to counsellors as a tool for non-formal education. The content of 16-hour-long training for career counselors cooperating with parents will also be presented.
O348
CONSTRUCTION OF TOURIST DESTINATION IMAGE BY YOUNG ISRAELI AND POLISH TOURISTS: THE ROLE OF EVIDENCE VERSUS SOCIAL BIASES

D11. Work and organization – Tourism

Helena Desivilya Syna, The Max Stern Yezreel Valley College, Emek Yezreel – Israel
Sharon Teitler-Regev, The Max Stern Yezreel Valley College, Emek Yezreel - Israel
Shosh Shahrabani, The Max Stern Yezreel Valley College, Emek Yezreel - Israel

The study aimed to unravel the role of evidence-based information versus preconceived notion of Poland and Israel in selection of these 2 tourist destinations by Israeli and Polish students, respectively. Global economic crisis compels nations to promote incoming tourism as an important branch of economy, producing fierce competition among destinations. Effective coping with this challenge requires understanding destination selection process. Prior research shows that potential destinations compete primarily on the basis of tourists’ images. Thus, it is essential to explicate how potential tourists form their views of traveling targets. What kind of data figures prominently while forming destination image: evidence-based information or preconceived notions based on stereotypes, prejudice and legacies of historical events? To examine the research question, the study focused on young tourists, ardent users of digital media, in Israel and Poland, linked by a traumatic history. A structured questionnaire was administered to 400 Israeli and Polish students. Initial findings on Israelis show that despite frequent use of digital media, their destinations images are biased, tilting towards preconceived notions of Poland as merely a historic site (previously visited on a Holocaust educational tour) and hence unattractive target for traveling. Hence, significant and adverse past legacies seem to take precedence over evidence-based information in construction of destination image.
The present study investigates the connections between personal value preferences, group identifications, and cultural practices among Palestinian-Israelis working in close contact with the Jewish population in Israel. One hundred twenty two Palestinian-Israelis participated in the study. The participants were employed in different professional positions in the general health system in the Tel Aviv Metropolitan area, and were recruited to the study using the snowball technique. A stronger national identification was associated with a higher preference for the security and conformity values, and with a lower preference for the benevolence, humility, and universalism values. A stronger ethnic identification was associated with a higher preference for the tradition and humility values, and a lower preference for the power, stimulation, and security values. Greater engagement in Israeli cultural practices was associated with a higher preference for the values of achievement, hedonism, stimulation, and self-direction and with a lower preference for the values of humility, power, and tradition. Finally, greater engagement in Palestinian cultural practices was associated with a higher preference for the face and a lower preference for the power values. The results obtained contribute to a deeper understanding of the role of group identifications and cultural practices in promoting the attainment of personal motivational goals among members of an ethnic minority group.
O356
PSYCHOLOGICAL ADJUSTMENT, MOTIVATION TO SERVE IN THE ARMY, AND PERSONAL VALUE PREFERENCES OF SOLDIERS IN THE ISRAELI DEFENSE FORCES

C06. Culture and society - Attitudes and values

Eugene Tartakovsky, Tel Aviv University, Tel Aviv - Israel
Noa Rofe, The Israel Defense Forces, Tel Aviv - Israel

The present study examined the connections between personal value preferences, motivation to serve in the army, and the psychological adjustment of soldiers in the Israeli Defense Forces. Male soldiers serving in three combat units participated in the study (n = 257). The results obtained confirmed that values are an important factor explaining soldiers’ motivation to serve in the army and their psychological adjustment. A higher preference for the power values and a lower preference for the face values were associated with a higher motivation to serve in the army. A higher preference for the face and personal security values was associated with a higher level of perceived hardships. At the same time, a higher preference for the values of universalism, conformity, achievement, and social security was associated with a lower level of perceived hardships. Finally, a higher preference for the achievement and social security values and a lower preference for the face and hedonism values were associated with a higher level of self-efficacy. The results are discussed in light of the value congruency paradigm and Schwartz’s theory of values.

PROMOTING ACADEMIC SUCCESS IN DIFFICULT CONTEXTS. AN EFFECTIVE MODEL IN ITALIAN PRIMARY SCHOOL

B02. Development and education - School adjustment, academic achievement and learning disabilities

Giovanna Malusà, University of Trento, Trento - Italy

The present study explores which process can provide a quality learning for all pupils living in difficult contexts, ambitiously aiming at constructing a social justice education model, particularly addressed to migrant students' inclusion. A critical Grounded Theory method in its constructivist approach (Charmaz, 2014) was used to guide this inquiry that involved 26 teachers, 36 parents and 19 students of a primary school in Trentino. The progressive data collection from 2005 to 2011 included 62 focused interviews to key informants, observations and questionnaires. The data analysis was carried out according to the Grounded Theory procedures (Tarozzi, 2008) with a transformation into text and a verbatim transcription of all the material, encoded with the support of NVivo9. The author developed from a systemic perspective the conceptual relations between the seven built categories and identified four stages of the process that, in a progressive temporal circularity, enhance the system in itself in the construction of effective paths to promote quality education for all in complex contexts: (1) choosing ethically, (2) facilitating the experience with effective strategies, (3) constructing social skills, (4) quality of learning for all. In particular, the conditions of transferability that emerge from data - social equity as ethical choice, congruent political contexts, teachers’ competences - could be relevant for designing inclusive scenarios in the Italian primary school.
Resilience and labor links play an important role in building self-esteem personal, professional and social development of people with disabilities. The aim is to establish the relationship between psychosocial risks and resilience in workspace in people with physical disabilities that have a job in Colombia. The quantitative research is correlational. The sample was collected by convenience; the sample consisted of 82 people, with an average of 40.8 years, and D.T. 9.8. The 81.70% men and 18.30% women. The 88.6% have limitations in lower extremities; this disability is caused by general disease (20%) and/or traffic accident (20%). The main barriers to access work places are in the bathrooms (40%) and stairs (9.8%). The results indicate that 62.2% of workers have resilient characteristics, components of acceptance and competence. Scores on the psychosocial risks in work place indicate that people with physical disabilities that are in management positions are at a high risk level and who work in positions such as assistants or operators rated at a medium level of risk. There is an inverse correlation between psychosocial factors and resilience as part of the adaptation process. Resilience is a protective factor for individuals with physical disabilities in organizations; therefore, preventive intervention, control of architectural and social barriers are organizational strategies for the reduction of occupational diseases and accidents.
IS MONEY PERCEPTION INFLUENCED BY THE AWARENESS OF THREAT ABOUT THE CRISIS AND PERSONALITY TRAITS? THE ITALIAN CASE

Stefano Ferrinda, University of Milan-Bicocca, Milan - Italy
Massimo Bustreo, IULM University, Milan - Italy
Davide Moro, IULM University, Milan - Italy

Starting from the results of the studies of Snelders, Hussein, Lea, & Webley (1992) and Rumiati & Lotto (1996 and 2006) the previous research (Bustreo, Ferrinda, & Moro, 2014) has shown how the mental representation of the “money” category should be different among people as they have different ways of handling money depending on their specific activities and on the different levels of expertise. The aim of this research was to investigate the differences in the perception of money by students, retailers and bank clerks, and how these differences depend not only from the expertise in handling money but also from traits of personality and awareness of threat about the actual economic crisis. To reach this goal the study used the new Financial Threat Scale (Marjanovic, Greenglass, Fiksenbaum, & Bell, 2013), a 5-item scale which was designed to measure the awareness of the economic crisis. A variant of Myer-Briggs Test Indicator (Antoni & Giaconi, 2012) was used to analyze the personality traits. A replication study of the questionnaire of Rumiati & Lotto (2006) was done to confirm the evidence that showed that different exemplars of money are actually perceived as differently representative of the concept of “money”. 210 participants (students, retailers and bank clerks) filled out the tri-partited on-line questionnaire. Through a Factorial Analysis of Variance and Covariance results show that there are some significant correlations between personality traits and perception of economical crisis, as well as between the perception of money and the crisis awareness. Some results are discussed about the differences perceived by the subjects of a specific category (but lower than those generated by the personality traits) and crisis. Finally, referring to the previous studies of Rumiati & Lotto (1996 and 2006), the perception of money changed in the Italian context in the last few seven years and the economical crisis could be one of the main causes. For that reason this second research wants to extend those results in a Italian sample (the same category of the previous study, for a total of 900 partecipants: 300 students, 300 retailers and 300 bank clerks.). For reach our goal we used an evolution of the questionnaire of 2014 (we improve the Rumiati & Lotto Questionnaire with newest methods of payment) and in addition we introduce the variable “annual income” to try to observe correlation with this new variable with the perception of crisis.
In this study perception of women quotas (WQs) in academics is investigated from the perspective of Social Representation Theory. Social representations (SRs) are common-sense knowledge about socially significant phenomenon. SR Theory is ideal to study socio-political change and related opposition. WQs are juxtaposed with men quotas (MQs) in academics. This helps to detangle gender-based reactions from those based on beneficiary-status. As method the associative-network-technique was applied. Participants freely associated with WQs or MQs. For each association, participants indicated its value (positive, neutral, negative) and its emotional content. Indices of polarity, neutrality and emotionality were calculated. Analyses of variance and t-tests were conducted. A nucleus-analysis was performed on the word associations to outline central ideas. 340 undergraduate medicine students participated. Overall, associations with WQs and MQs were negative. Women perceived WQs more negative than MQs. Men perceived WQs less neutral and more emotional than MQs. The associations’ content was polarized. Contradictory associations (fair vs. unfair, discrimination vs. equality, necessary vs. unnecessary) were central. Words related to beneficiary-stigmatization were solely associated with WQs. In sum, women dislike quotas they benefit from; men dislike quotas they don’t benefit from. This has implications for theory and praxis of gender equality that will be discussed in this contribution.
O378
A VALIDITY AND RELIABILITY STUDY OF THE TURKISH VERSION OF CANCER BEHAVIOR INVENTORY

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

İrem Akinci, Middle East Technical University, Ankara - Turkey
Cansu Akyüz, Middle East Technical University, Ankara - Turkey
Özlem Bozo, Middle East Technical University, Ankara - Turkey

In the literature, studies showed that the self-efficacy of cancer patients is related to their quality of life in different domains. Considering the need of a scale measuring the cancer related self-efficacy in Turkish culture, the Cancer Behavior Inventory (CBI) developed by Merluzzi et al. (2001) was adapted to Turkish in the current study. The participants of the study were 120 cancer patients. In addition to Turkish version of CBI, participants were administered the Beck Depression Inventory, the Multidimensional Quality of Life Scale – Cancer, the Coping Strategies Scale, the Life Orientation Test-Revised, and the General Self-efficacy Scale to test the validity of the adapted scale. The results showed that the CBI has a four-factor model in Turkish culture. The internal consistency of the scale was found .91 and the internal consistencies of the subscales ranged between .70 and .90. The validity scores of the scale were also found satisfactory. The regression analysis revealed that the CBI predicts the patients’ quality of life better than the General Self-efficacy Scale. The results, limitations and directions for future studies were discussed.
MEDIATING EFFECTS OF COMMUNICATION IN THE RELATIONSHIP BETWEEN PRINCIPAL LEADERSHIP AND TEACHER PROFESSIONAL LEARNING IN HONG KONG PRIMARY SCHOOLS

Lijuan Li, The Hong Kong Institute of Education, Hong Kong - Hong Kong

Research have repeatedly reported that principals influenced student achievement through leadership on building school capacity for improving teacher professionalism. For principals, enabling effective communication is one approach to build up school capacity and one basic competence to lead effectively. This study aimed to identify and assess effects of communication in the relationship between principal leadership and teacher professional learning in Hong Kong primary schools. Two questionnaires were combined to survey teacher perceptions of principal leadership and school capacity from a sample of 970 teachers from 32 local primary schools. Baron and Kenny’s (1986) four-step causal process for mediation analysis was employed, integrated with bootstrapping method. Significance and size of the mediating effect of communication were further tested. Next, mediating effects of communication between the seven core areas of principal leadership practices and teacher professional learning were examined and compared. The findings affirmed the mediated leadership structure. The implications are that, effective communication helps teachers come to understandings across differences and work together to shape the working environment and meet the targets of their professional learning. As resources providers and communicators, principals should lead adequately to ensure the key precondition of successful teacher professional learning – effective communication.
O382
TEMPORAL ORIENTATION AND COPING WITH POSTOPERATIVE PAIN

E03. Health and clinical intervention - Personality assessment

Malgorzata Sobol-Kwapinska, The John Paul II Catholic University of Lublin, Lublin - Poland
Wlodzimierz Plotek, Poznan University of Medical Sciences, Poznan - Poland
Marcin Cybulski, Poznan University of Medical Sciences, Poznan - Poland
Anna Kluzik, Poznan University of Medical Sciences, Poznan - Poland
Jolanta Krystianc, Poznan University of Medical Sciences, Poznan - Poland
Michał Mandecki, Poznan University of Medical Sciences, Poznan - Poland

The purpose of the studies was to determine the relationships between temporal orientation of the patient, post-operative pain that such patient endures and strategies for coping with it. According to the concept of Zimbardo and Boyd (1999, 2011), temporal orientation was defined as a fixed cognitive style resulting from preferences for using individual mental and temporal representations. Coping with pain was presented in line with cognitive-behavioural model of Rosenstiel and Keefe (1983). The following main research hypothesis was suggested: temporal orientation of the patient is significantly combined with post-operative pain the patient suffers from and strategies for coping with such pain. The studies were carried out among patients (75 people) undergoing surgeries with general anaesthesia. The following methods were used: the Zimbardo Time Perspective Inventory, the Carpe Diem Scale, the Numeric Rating Scale, and the Coping Strategy Questionnaire. Patients with strong active present time orientation were able to cope with pain much better compared to patients with future and past time orientation. Focusing on the present allows the reduction of negative emotions associated with the past (sorrow, sadness, pain memory) and the future (fear), which reduces the tension and makes patients better handle postoperative pain. The results can be used in therapy with patients to develop techniques for coping with pain based on active focus on the present.
COPING WITH THE DEATH ANXIETY BEHIND THE WHEELS: DESIRABILITY OF CONTROL MODERATES THE EFFECT OF MORTALITY SALIENCE ON SPEEDING

A11. General issues and basic processes - Motivation and emotion

Sinan Alper, Middle East Technical University, Ankara – Turkey
Türker Özkan, Middle East Technical University, Ankara – Turkey

Past research has showed that mortality salience (MS), contrary to the common sense, increases reckless driving and speeding when the individual perceives driving to be relevant to his or her self-esteem. We expected that a more fundamental individual characteristic, namely the desirability of control (DC), would modify the effect of MS on speeding. We tested our hypothesis using an online experiment on a sample consisting of young men who are active drivers (N = 208). The results showed that, for individuals with low DC, MS increased preferred speed and decreased intention to comply with speed limit and the percentage of time complying with the speed limit on urban roads with 50 km/h speed limit, but not on rural roads with 90 km/h speed limit. For individuals with high DC, on the other hand, MS increased intention to comply with the speed limit on rural roads and percentage of the time complying with the speed limit on both urban and rural roads. It is argued that, when exposed to MS, drivers with high DC become more careful drivers as they become more protective over their personal influence over the course of events; on the other hand, drivers with low DC become more reckless because they want to see themselves survive the threat of death by the help of chance and fate. The findings suggest that future anti-speeding campaigns must be tailored in accordance with the level of DC of the target population.
O388
THE EFFECTS OF LYING AND IMAGINING ON AUTOBIOGRAPHICAL MEMORIES

A09. General issues and basic processes - Learning and memory

Veronika Nourkova, Lomonosov Moscow State University, Moscow - Russian Federation
Anna Ivanova, Lomonosov Moscow State University, Moscow - Russian Federation
Alexandr Kozhevnikov, Lomonosov Moscow State University, Moscow - Russian Federation

Lying about presence/absence of a picture on a list often leads to memory errors (Vieira & Lane, 2013). The present study investigates the possibility that the same happens when people make false claims about real-life events. Fifty young adults who spent two consecutive summers at a particular summer camp served as participants. Each was presented with a list of events and asked to choose two events that s/he believed had happened the previous summer and two events s/he believed did not happen. Participants then attempted to describe the 4 chosen events in a way that would convince another person that the event happened or that it did not happen. As a control, participants described a false, but plausible event, from the same period. A week later, participants rated how confident they were that each Session-1 event actually occurred. Surprisingly, 42% of the participants indicated that the control event had occurred. In addition, 32% of the retold-as-if-true false events were incorrectly recognized and 34% of retold-as-if-false true events were incorrectly rejected. Performance was at ceiling otherwise. These finding indicate that memory for autobiographical events is generally more accurate than memory for lab events. However, the act of lying appeared to have converted implausible memories into plausible ones and vice versa in more than a one third of the time, and the mere act of imagining a plausible false event also had a powerful negative effect on memory performance.
O390

EMPATHY, IMMEDIACY, AFFECTIVE BEHAVIOR, CLOSENESS AND SELF-DISCLOSURE AS PREDICTORS EMOTIONAL CO-REGULATION STRATEGIES

C02. Culture and society - Family systems and processes

Rozzana Sánchez-Aragón, National Autonomous University of Mexico, Mexico City - Mexico

Emotional regulation and its role in the context of personal relationships, has become a inspiring topic to be studied for social psychologists. Particularly Gross, Richards, & John (2006) and Butler & Randall (2012) point out that couple relationship is the main context in which persons make more effort to regulate their emotional experiences, mainly those classified as negative (Vázquez & Ring, 1996). The consequences of these emotions make difficult the interaction between the members of relationship demanding physical and mental resources (Koole, 2009), which allow them or not, to manage properly their negative emotions outlining the relationship success or failure (Perlman, 2000). In Mexico, Sanchez-Aragon (2014) identified four main co-regulation strategies: Constructive communication & intimacy, Supression-Agression, Re-appreciation, solution & affect and, Physical contact & fun. Based on this, the aim of this study was to explore the role of empathy, immediacy, affective behavior, closeness and self-disclosure on the co-regulation strategies displayed in response to negative emotions. To do so, we studied a nonprobabilistic sample of 389 couples from Mexico City. Findings show: 1) differential effects by gender, 2) the importance of self-disclosure (regarding achievements, relationship, freedom, plans and likings), empathy (perspective taking and about emotions), affective behavior and immediacy (high) as triggers for both positive and negative strategies.
O391
EMOTIONAL REGULATION STRATEGIES IN WOMEN AND MEN FROM MEXICO AND BRASIL

C05. Culture and society - Group processes and intergroup relations

Rozzana Sánchez-Aragón, National Autonomous University of Mexico, Mexico City - Mexico
Alexsandro Luiz de Andrade, Federal University of Espírito Santo, Vitória - Mexico
Daniela Silva Moctezuma, National Autonomous University of Mexico, Mexico City - Mexico

During the last decade the research emotional regulation (ER) has been recognized as fundamental matter to study due to its importance in the understanding of human being emotional and social life. Especially in romantic relationships the ER strategies (ERE) from two parties constantly are displayed and make the interaction constructive or destructive having vital effects in the relationship quality and satisfaction –among other consequences- (Perlman, 2000; Horn et al., 2009; Sánchez Aragón, 2014). Based on this, the study of their dynamic and manifestations become necessary including gender and the socio-cultural context. Due to a lack of research in this topic in Latinoamerica, the aim of this study was to explore the differences and similarities between men and women from Mexico and Brasil respecting the ERE used in the romantic relationship. To do so, we studied two equivalent nonprobabilistic samples of 108 couples each one. Results show: 1) differential effects by gender showing that men used to perform more expressive suppression and cognitive reappraisal than women either in positive and negative emotions. 2) Cross-cultural data indicates that participants from Mexico deploy those strategies in greater extent than their Brazilian counterparts. This research is the first part that will be continued thru the study of ERE correlates (empathy, relationship quality) as well as the dyadic effects of those variables.
EXPLORING NATIONAL DIFFERENCES IN CIVIC ENGAGEMENT: A STUDY OF CULTURAL DIMENSIONS

Canay Doğulu, Middle East Technical University, Ankara - Turkey
İlker Dalğar, Middle East Technical University, Ankara - Turkey
Gaye Solmazer, Middle East Technical University, Ankara - Turkey

The aim of the current study is to explore whether there are cultural differences in countries’ level of civic engagement. Introduced by Hofstede (2001), dimensions of national culture (power distance [PDI], uncertainty avoidance [UAI], individualism vs. collectivism [IDV], masculinity vs. femininity [MAS], and long- vs. short-term orientation [LTO]) have been studied in relation to various country-level data. In an effort to contribute to this line of research, this study focuses on civic engagement, which is considered a form of civil participation including volunteering in community organizations (Ekman & Anna, 2012). A correlational (ecological) design with 40 countries (i.e., participants) was employed. Data from the 5th wave of World Values Survey was used to obtain a measure of civic engagement (country percentages for active membership of voluntary organizations). Country scores on cultural dimensions were obtained online. The findings showed that as countries’ levels of PDI, UAI, and LTO decreased, people more actively participated in social, political, and religious organizations. The present study highlights the importance of international surveys for social researchers as they provide open source data to conduct nation-level analyses. Further, our findings provide insight into cultural processes involved in civic engagement at the country level with implications for community well-being and social protests.
THE EFFECT OF MULTIPLE CHILD ABUSE AND WITNESSING FAMILY VIOLENCE ON THE RISK OF EXPERIENCING INTIMATE PARTNER VIOLENCE

This study examines the roles of histories of child abuse and neglect (CAN) and witnessing family violence (WFV) on intimate partner violence (IPV). The research emphasize the increasing effect of child abuse on the experiencing later (re)victimization. Of the 263 women, 189 20-63 years old women who married at least once accepted to participate. 70.4% of women reported a multiple child abuse history. 69.3% of women reported psychological, 34.4% of women reported physical, 27.5% of women reported sexual; and 15% of women reported injury violence in subsequent relation. The survivors of CAN have experienced higher IPV than control participants. Logistic regression analysis showed generally that sexual, psychological, physiological, and injured victims by partner violence reported more experiences of witnessing family violence as a child compared to controls. To conclude, childhood physical abuse, multiple types of experiences, and witnessing family violence were found strongly associated with recent IPV. This study highlights the importance of child maltreatment effects on later partner violence. Practitioners and clinicians may take a consideration of the importance of child maltreatment prevention as a way to reduce risk of later violence.
RESILIENCE AND VULNERABILITY: COMPLICATED GRIEF IN THE BEREAVED SPOUSES OF MARITAL PARTNERS WHO DIED OF AIDS

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Nancy Xiaonan Yu, City University of Hong Kong, Hong Kong - Hong Kong
Cecilia, L. W. Chan, The University of Hong Kong, Hong Kong - Hong Kong
Jianxin Zhang, Institute of Psychology, Chinese Academy of Sciences, Beijing - China
Sunita, M. Stewart, University of Texas Southwestern Medical Center at Dallas, Dallas - United States

Spousal bereavement is closely linked to complicated grief, i.e. significant adjustment symptoms that last for more than six months after the loss. This article focused on potential risk and protective factors that may influence bereavement outcomes. Participants in this study were surviving spouses of individuals who died of AIDS. These participants were themselves living with HIV. In this cross-sectional study, 120 bereaved participants completed measures of grief, quality of dying and death of the deceased, negative conceptions of death resulting from AIDS, death attitudes, and personal resilience. The results showed that about half (45.8%) of the bereaved participants reported grief levels above the complicated grief cut off scores, and can be categorized as the “complicated grief” group. Although quality of dying and death was not associated with the intensity of grief, negative conceptions of death from AIDS, fear of death and resilience independently predicted grief symptoms in the regression models. Our findings provide insight into the grief process for the surviving spouse of AIDS victims in rural China. Since resilience is malleable, developing resilience interventions to enhance adjustment to bereavement may be a promising direction in grief counselling and therapies.

VALIDATION OF ITALIAN VERSION OF GIFTED RATING SCALES - SCHOOL FORM. PRELIMINARY DATA

B02. Development and education - School adjustment, academic achievement and learning disabilities

Angela Beretta, University of Pavia, Pavia - Italy
Steven Pfeiffer, Florida State University, Tallahassee - United States
Maria Assunta Zanetti, University of Pavia, Pavia - Italy

The challenge of correctly identifying gifted students is one of the most critical issues to be resolved (Pfeiffer, 2003; Cramer 1991). This is particularly true in Italy where gifted education has experienced insufficient support (Zanetti, Renati, Beretta, 2013). This study tested the reliability and validity of the Italian version of the Gifted Rating Scales-School with a sample of Italian elementary and middle school students. The study examined the scales’ reliability in comparison to reliability results from the U.S. standardization sample. The criterion validity was tested by correlating student’s scores on the scales with student academic achievement, as measured by classroom grades and the INVALSI scores. The convergent validity was examined by comparing student’s scores with scores on the GAI of WISC IV. The complete sample was of 449 students, 222 male (48.5%) and 227 female (49.6%), mean age = 9.1, SD = 2.1. Reliability analysis yielded excellent reliability results, with α values ranging from .98 to .99. Several positive and significant correlations were also found between student scores on the GRS-S and the INVALSI. Preliminary findings suggest that the Italian GRS-S scores retain appropriate psychometric properties and provide preliminary support for the Italian version of the GRS-S as a reliable screening measure for the identification of Italian gifted students.
Intimate Partner Violence (IPV) is a significant public health issue and the most common form of violence against women worldwide regardless of their ethnic origin, economic status, education, religion or profession (Jeanjot, Barlow, & Rozenberg, 2008). For more than two decades, it has been known that pregnant women are not immune to IPV. It is estimated that between 1.2% and 18.4% of pregnant women experience physical, psychological and/or sexual abuse by a male partner (Jeanjot et al., 2008; Williams & Brackley, 2009). Nevertheless, research has shown mixed findings concerning whether pregnancy is a risk factor for the onset of IPV and whether IPV increases in severity during pregnancy (Hussain & Khan, 2008; McMahon & Armstrong, 2012). Concerns have been raised regarding women’s mothering under circumstances of IPV (Bhandari, Bullock, Anderson, Danis, & Sharps, 2011; Lapierre, 2010; Peled & Gil, 2011; Seeman, Jasinski, & Bubriski-McKenzie, 2013) as the quality of maternal care has been demonstrated to be an important factor that influences on how children are affected by the violence (Hazen, Connelly, Kelleher, Barth, & Landsverk, 2006). Nevertheless, little research has described the parenting abilities of IPV victims, and the available studies have found mixed results. The purpose of this presentation is to shed some light on the women’s mothering experiences in the context of IPV. Thus, the main aims of the current study are: 1) to understand and give voice to women who have been victims of IPV, 2) to assess the trajectories of IPV during pregnancy by examining whether IPV changes during pregnancy or remains similar to IPV before the pregnancy and 3) to determine whether IPV affects women's experiences of mothering. Method: Participants: Thirty-five individual semi-structured interviews with female victims of IPV were conducted using an interview guide based on the specific aims of the study. The participants for the study were recruited from six different agencies for victims of violence, such as shelters, social services, associations, and support groups for women who had suffered IPV in Bilbao and in San Sebastian (Basque Country, Spain). Selection criteria included being at least 18 years old, having suffered IPV in at least one prior relationship, and having children. At the time of the interviews, the women were aged between 26 and 60 years old (mean age = 44.23 years, SD = 10.30) and had between one and five children, who were aged between 1 and 39 years old (mean age = 16.45 years). Procedure: Data collection took place between July 2012 and June 2013. The women were interviewed individually by two researchers specialized in the field of violence against women and were informed that they were free to refuse to participate and to withdraw at any time. Interviews lasted approximately between 20 and 150 minutes and were recorded and transcribed with the participants’ permission. All participants were compensated with 20€ for each completed qualitative interview. This study was approved by the Ethics Committee at the University of Deusto. Analyses: The analysis was based on the transcriptions of the semi-structured interviews. The text was analyzed using content analysis (Bowling, 1997; Burnard, 1998) and themes were clustered into categories that were identified through the semi-structured schedules used for the interviews. Each interview was reviewed for accuracy and completeness. Results: The analysis of how mothers discussed the impact of IPV on their pregnancy and their mothering skills led to the identification of two main themes. Trajectories of IPV during pregnancy: The 35 participants suffered IPV at some or all of these three times, including psychological, physical, and sexual abuse. Psychological violence. Psychological violence was the most common type of violence experienced by the victims and, in general, was present before pregnancy (n= 28 of 35) and during pregnancy (n=26). More importantly, psychological abuse increased and was present in all the women after the baby’s birth. Physical violence. Physical violence appeared to carry over from physical abuse that occurred prior to pregnancy. Whereas psychological abuse was very frequent over the different stages, there was a tendency toward reduced physical violence during pregnancy and increased violence after the baby’s birth. Furthermore, some of the women described that physical violence not only was more frequent but also more
severe after giving birth. Sexual abuse. The women did not generally report sexual abuse. However, a few of them (n=3) indicated that they began to suffer sexual abuse in their last months of pregnancy. One of the women continued to experience sexual abuse after child birth. Some women explained that batterers interpreted pregnancy and childbirth as a negative period of time and, as a consequence, they triggered abusive acts. Mothering skills. Women stated being concerned about the impact that IPV could have on their children and also reported an increased sense of responsibility in regard to them. The participants’ responses to this topic were classified into the following three categories. Effects on parenting. The common thread in the stories of 28 women was that IPV negatively affected their parenting. Some of the interviewees emphasized their reduced time and energy to dedicate to their children, the increased feelings of concern that they had to address and their increased anger toward their children. Positive effects on parenting. Only two of the participants stated that their experiences of IPV had positive effects on their parenting. These women specified that their empathy and caring toward their children increased due to IPV. In addition, they stated that they constantly attempted to protect their children from the potential effects of IPV. No Influence on parenting. Three of the participants viewed themselves as good and competent mothers, explaining that their partner’s violence did not affect their parenting skills. Conclusions: The current study contributes new data on the prevalence of IPV before, during, and after pregnancy and the consequences of IPV for delivery and women’s mothering skills. The findings indicate that victims of IPV and their children are not protected against violence during pregnancy. Although the majority of the interviewees reported that they suffered IPV in at least one of the three studied moments, a small sample of the participants experienced negative outcomes at the time of delivery. Another noteworthy aspect of the study is that a high percentage of the women reported that IPV affected their mothering skills. However, the variety of responses on this topic suggests that future research should consider all aspects that may influence women’s mothering skills.
O423
THE EFFECTS OF CULTURAL VALUES ON NATIONS’ LEVELS OF HAPPINESS, TRUST, AND XENOPHOBIA

C06. Culture and society - Attitudes and values

Ezgi Sakman, Middle East Technical University, Ankara - Turkey
Gaye Solmazer, Middle East Technical University, Ankara - Turkey

The aim of the present study was to examine the possible effects of Hofstede’s cultural value dimensions, namely power distance, uncertainty avoidance, individualism, masculinity, and time orientation on different nations’ levels of happiness, trust and xenophobia, i.e. fear from the other. Building on the previous studies showing the effect of culture on many key constructs, it was conceived that an investigation of different value dimensions on interrelated variables of happiness, trust and fear of other could be informative. Forty nine countries were investigated in the study, the data for the happiness, trust and xenophobia measures were taken from the World Values Survey, Wave 5, and the cultural values data were taken from Hofstede’s website. The results of the regression analyses indicated that happiness was negatively related to uncertainty avoidance and long-term orientation; trust was positively associated with long-term orientation and negatively associated with power distance and uncertainty avoidance; and xenophobia was positively related to power distance and negatively related to individualism. Overall results suggest that cultural values may have a significant effect on crucial constructs, such as a nation’s happiness, trust and fear of others. The findings were discussed vis-à-vis implications for different cultural contexts, and the contributions of the current study as an exemplar for open source data usage in studies of key cultural variables.
DO CHRONIC ATTACHMENT ORIENTATIONS AND ATTACHMENT-RELATED SUBLIMINAL PRIMES AFFECT COGNITIVE ATTENTIONAL TASK PERFORMANCE?

Ezgi Sakman, Middle East Technical University, Ankara - Turkey
Nebi Sümer, Middle East Technical University, Ankara – Turkey

The purpose of the present study was to investigate if the subliminal presentations of threat and attachment figure primes would affect the cognitive attentional task performance of participants with different attachment tendencies. It was hypothesized that participants with high attachment anxiety would experience performance decline under both conditions of attachment threat and attachment figure primes. Those with high attachment avoidant were hypothesized to perform poorly only when a threat prime is followed by an attachment figure prime. University students in Turkey (N = 225) first completed a questionnaire package including the measures of attachment figure names (WHOTO), attachment anxiety and avoidance (The Experiences in Close Relationships, ECR); and then, participated in a computerized Signal Detection and Stroop task measuring cognitive performance in a laboratory setting. The results of ANCOVA analyses indicated that attachment anxiety makes people vulnerable to cognitive performance decline, especially when attachment threat is paired with attachment figure primes. Attachment security was identified as a protective factor for cognitive performance in face of the distracting effects of subliminal threat or attachment figure availability primes. The findings were discussed vis-à-vis existing literature and cultural implications.
O429
HISTORY OF CHILDHOOD EMOTIONAL ABUSE AND TRAUMATIC SHAME EXPERIENCES IN ADULTS

B06. Development and education - Emotion and self

Olga Bogolyubova, Saint Petersburg State University, Saint Petersburg - Russian Federation
Elena Kiseleva, Saint Petersburg State University, Saint Petersburg - Russian Federation

The goal of this study was to explore the psychological and psychophysiological correlates of traumatic shame experiences in a sample of young adults. Forty adults aged 18 – 25 were recruited to participate in this study. The study participants were asked to describe a situation in which they experienced acute shame and their narratives were recorded. The participants’ heart rate was measured at 4 points during the experiment. Self-report measures of shame proneness, impact of event and childhood adversity were also employed. Results of the study demonstrated that the self-rated symptoms of intrusion, avoidance and hyperarousal related to the traumatic shame episode were correlated with the heart rate reactivity during the recounting of the shame experience episode. Study participants who have experienced childhood psychological abuse were more prone to shame reactions and demonstrated more prominent heart rate reactivity during the shame narrative. Childhood emotional abuse makes young adults more prone to feel ashamed and to experience shame as psychological trauma.
A REVERSED WORD LENGTH EFFECT. INCREASED PREVALENCE OF DIGITS WITH TWO SYLLABLES IN DIGIT SPAN TESTS INCREASES SCORE

A03. General issues and basic processes - Psychometrics

Presenter: Lars Egner, Lillehammer University College, Lillehammer - Norway

Earlier studies have linked brevity of digits to arithmetic skills. It was hypothesized that this effect can be shown as a connection between the prevalence of digits with 2 syllables and digit span score. The study used a within subject design with full counterbalancing and a full sample of 54 Norwegian undergraduate college students. A study was conducted to test if the prevalence of digits with 2 syllables in a digit span test had impact on the test score. The primary intention of the study was to make users of the test aware of a potential variable that could increase or decrease the score, reducing the reliability of the test. The secondary intention was to further explore the phonological loop in a multicomponent model perspective. The results showed that increasing the prevalence of 2 syllable digits in forward digit span tests from none to standard and double amount increased the score by 9%, partial eta squared 0.347. No significant results was found between standard and double amount of 2 syllable digits and backwards span showed no effect in any way. The results suggest that the prevalence of 2 syllable digits should be taken into account in future creation of digit span tests to improve reliability. It is also suggested that backwards span do measure the capacity of the visuospatial sketchpad and not the phonological loop. The results also contradicts previous findings suggesting that the brevity of numbers always have a negative correlation with performance.
Implicit researches are mainly devoted to the study of emotional loyalty, while relatively little research has been conducted in cognitive loyalty. The aim of the present study was to investigate consumer loyalty (cognitive, emotional) using explicit and implicit measurements. Method: Participants - 100 consumers of Latvian mobile network. Mdn - 32 years. Implicit measures: the experimental procedures of IAT (Implicit Association test) two versions: IAT-1 - attitude towards the brand (emotional loyalty); IAT-2 - attitude towards the price of service (cognitive loyalty). Explicit measures: modified "Semantic differential" allowed us to measure cognitive and emotional loyalty. Results: The designed experimental procedures of IAT allowed us to measure the effect of the latent, implicit preferences of the brand associated with emotional loyalty, and verbal stimuli (price of service) associated with cognitive loyalty and an attribute that has a positive or negative valence. Result of explicit measurement shows that every consumer prefers his or her own mobile operator. However, the effect of implicit preferences that is connected with emotional and cognitive loyalty of customers of A operator is higher than that of B operator. The negative effect of implicit preferences for customers of B operator is higher than that of A operator. Conclusions: The implicit and explicit measures provide an opportunity for deeper understanding of consumer loyalty as a multidimensional construct.

RELATIONSHIP BETWEEN FACEBOOK ADDICTION DISORDER WITH PERSONALITY CHARACTERISTICS, SELF ESTEEM, EARLY MALADAPTIVE SCHEMAS AND NARCISSISM

Sadrollah Khosravi, Islamic Azad University, Firooz Abad - Iran
Tayebeh Shahrivar, Islamic Azad University, Shiraz - Iran
Leyli Shahriyari, Islamic Azad University, Shiraz - Iran
Masoumeh Hamidi, Islamic Azad University, Yasouj - Iran
Habib Dehghani, Islamic Azad University, Shiraz - Iran

Introduction: The purpose of this study is to consider Facebook addiction disorder and relationship between some of analytic variables such as extroversion, introversion, self esteem, narcissism, and early maladaptive schemas with Facebook addiction disorder. Method: 180 person (102 males and 78 females) from the Salman Farsi University, Islamic Azad University and high school Students Kazeroon, which has had a Facebook account, were selected with nonrandom sampling and they responded to Bergen Facebook Addiction Scale (BFAS), Cooper smith self-esteem questionnaire, Eysenk personality questionnaire, Young early maladaptive schemas questionnaire and Ames narcissism questionnaire (NPI16) .For this study we used, Pearson correlation and Regression Analysis. Results: The results of the statistical analysis showed direct positive effect of all variables, except self-esteem on Facebook addiction. Results show, extraversion has negative relation with Facebook addiction and narcissism, introversion, and early maladaptive schemas, have a significant and positive relation with the Facebook addiction. Keywords: Facebook addiction disorder, narcissism, introversion, self-esteem, early maladaptive schemas.

99 CASE STUDIES OF INSIDER THREAT: AN EXAMINATION OF THE PROFILE OF AN INSIDER

C11. Culture and society - Forensic psychology and law

Monica Whitty, University of Leicester, Leicester - United Kingdom

The threat from insiders to an organisation is a growing concern. An insider is anyone working within a central government department or a commercial organisation that attacks that organisation; examples include: theft (IP, company secrets, money, data), fraud, terrorism, reputation damage, blackmail, denial of service attacks, introduction of viruses, worms, Trojan horses, corruption or deletion of data, altering data, and password cracking. There is very little scholarly work available on the profile of an insider. We present here the findings from 99 case studies of insider threat cases in the UK. In the research we conducted semi-structured interviews with: IT specialists, investigators, law enforcement, security officers, line managers and co-workers. We conducted a grounded theory analysis to examine: the psychological profile of these individuals, their motivations, how they went about committing the attack, its discovery and strategies the organisation employed to minimise the likelihood of attack and the potential cyber indicators that could be used for close to real time detection. Some typical psychological characteristics included: traits from the dark triad, low on conscientiousness and a change in organisations identity. Further findings and examples of case studies will be presented together with a critical discussion on detecting insider threat from the viewpoint of a psychologist.
O444
FLY-IN-FLY-OUT WORKER ARRANGEMENTS: THEIR IMPACT ON EMPLOYEE ENGAGEMENT, EMOTIONAL EXHAUSTION, AND PROACTIVE PERFORMANCE

D04. Work and organization - Well-being at work

Simon L. Albrecht, Deakin University, Melbourne - Australia
Jeromy Anglim, Deakin University, Melbourne – Australia

Fly-In-Fly-Out (FIFO) work arrangements have become increasingly widespread in Australia and the subject of intense media and government attention. This attention has largely focused on issues to do with the work-life experiences of employees and their families (e.g. work-life balance, work-family conflict, divorce rates) and the social and economic impact of FIFO on the economic and social fabric of host communities. However, little is known about the impact that FIFO work arrangements have on the motivation and psychological wellbeing of employees across FIFO work cycles. It is not known, for instance, whether FIFO workers experience more anxiety, depression, enthusiasm and/or engagement at the beginning, middle or end of their FIFO work cycle. Diary data, collected from 52 Australian FIFO workers, analyzed using multi-level modeling, was used to determine the extent to which daily perceptions of demands, supports, and control were associated with employee daily engagement, emotional exhaustion and proactive performance. The results provide valuable insights toward understanding and enhancing employee engagement, wellbeing and performance in practice.
O445
ORGANIZATIONAL POLITICS, JOB DEMANDS, MEANINGFUL WORK AND EMPLOYEE ENGAGEMENT: A JOB DEMANDS-RESOURCES ANALYSIS

D04. Work and organization - Well-being at work

Simon L. Albrecht, Deakin University, Melbourne – Australia

This study aimed to elaborate the Job Demands-Resources model (Bakker & Demerouti, 2008, 2014) by examining how organizational politics, as an organizational level demand, influences job demands, employee engagement and downstream outcome variables. Structural equations modelling of survey data obtained from 240 employees from a range of organizations showed the direct and indirect influence of organizational politics on job demands (emotional demands, role ambiguity and role conflict), employee engagement, and proactive performance. The fit of the proposed measurement and structural models met criterion levels and the structural model accounted for sizable proportions of the variance in work meaningfulness, employee engagement and proactive performance. The study provides researchers and practitioners with an elaborated JD-R framework that can be used to help understand, develop and manage engagement and its outcomes. Study limitations and future research opportunities are outlined.

CHILDHOOD CONDUCT PROBLEMS ASSOCIATED WITH INCREASED PARTNERSHIP AND PARENTING RISK IN ADULTHOOD

B15. Development and education - Longitudinal analysis

Alessandra Raudino, University of New South Wales, Sydney – Australia
Lianne J. Woodward, Brigham & Women's Hospital, Boston - United States
David Fergusson, University of Otago, Christchurch - New Zealand
John Horwood, University of Otago, Christchurch - New Zealand

BACKGROUND AND AIMS: Childhood conduct problems have been linked with a wide range of adverse outcomes in adulthood, including ongoing mental health problems. This study examines the associations between childhood conduct and subsequent partnership and parenting difficulties at age 30. METHODS: Participants were members of the Christchurch Health and Developmental Study. Parents and teachers reported the extent of children's conduct problems (age 7-9). At age 30, the partner relationship and parenting behaviours of sample members were assessed based on self and interviewer reports. RESULTS: Results showed that as the severity of childhood conduct problems increased there was a corresponding increase in levels of relationship ambiguity (p = .02), and inter-partner conflict (p= <. 0001); an increase in parental over-reactivity (p = .002), use of physical punishment (p=.003) and inconsistent discipline (p = .01). Similarly, as the severity of conduct problems increased there was a corresponding decline in observed (p <.0001) and self-reported levels of parental warmth (p= .001), observed (p <.0001), and self-reported sensitivity/responsiveness (p= .003) and child management strategies (p < .0001). These associations were found largely to persist after confounding factors and selection bias were taken into account. CONCLUSIONS: Study findings demonstrate that children with high conduct problems are at increased risk for later dysfunctional partner relationships and parenting difficulties.

CHRONIC FATIGUE SYNDROME/MYALGIC ENCEPHALOMYELITIS: IDENTITY NEGOTIATION AND RECONSTRUCTION WITHIN THE AUSTRALIAN CONTEXT

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Melissa Tori, Victoria University, Melbourne - Australia

The study investigates identity construction through the lens of disease state. In any year 0.4% to 2.5% world-wide are affected by Chronic Fatigue Syndrome/Myalgic Encephalomyelitis (CFS/ME). In Australia CFS/ME annually affects approximately 180,000 individuals. It is more prevalent than AIDS, breast cancer and or lung cancer, yet it is largely misunderstood and relatively little is known of its etiology, particularly in terms of psychological characteristics especially associated with identity. While the condition suggests significant psychological effects in confronting and managing the disease, there is a paucity of research addressing the consequence of CFS/ME on identity. This study investigates a sample of Australians diagnosed with CFS/ME as they make sense of their self in the context of their world. The study explores their lived experience as they negotiate a new and reconstructed identity. The research employs a social constructionist epistemological framework within a symbolic interactionist, phenomenological theoretical perspective. Data consists of personal in-depth unstructured interviews. The findings will contribute to an increased awareness of and lessening of misunderstandings of CFS/ME. This research will also provide knowledge into the processes of identifying with CFS/ME. Furthermore, the findings may also be incorporated into support programs to address the post-diagnosis psychological and emotional consequences of identity transition and challenges.
Lately crimes of violence have started to occupy one of the leading positions among important social problems. From our point of view crimes of violence are cumulative phenomena uniting: a murder; a child’s murder; a murder of an a priori helpless person; a murder of an a priori pregnant woman committed with extreme atrocity; killing of passion; forcible suicide etc. The basis to unite these crimes is the fact that they are committed in the family circle, and are conditioned by such social-psychological factors as destructive family relations, personal deadaptation. We have come to this conclusion having studied and analyzed the materials of the criminal cases and court orders in several regions of the country for seven years. The survey among the investigators (163 respondents) and judges (137 respondents) showed that to reveal true motives of such crimes without psychological knowledge (in the form of specialists’ consultations and forensic psychological assessment) is very difficult. Of special relevance is the question of how personal adaptation of every family member goes contributing to the development of victim and co-dependent behaviour in the family. We also analyzed crime motives. Having summarized the results provided by other authors’ and our personal research plus the materials of the legal precedents we came to a conclusion that crimes of violence committed in a family depending on the motives can be divided into 5 groups. The most wide-spread cases are when the main motive of violence is a criminal’s desire for self-affirmation. Violence acquires independent meaning as a means of establishing of criminal’s power.
“I’d rather stay at home and die than go to the clinic and lay out my private parts there.” - Cervical Screening in a Disadvantaged Community, South Africa

Chantelle Silva De Abreu, University of Cape Town, Cape Town - South Africa

Approximately 85% of the global cervical cancer deaths occur in women living in developing countries. In South Africa, cervical cancer is the second most common cancer amongst women, with Black South African women having the highest risk of developing cervical cancer. Previous research with the same population group found that there are structural (time, health education, age) and psychosocial (fear of screening and stigmatization) influences to cervical screening. The purpose of this research was to identify socio-cultural factors affecting cervical cancer screening adherence within a disadvantaged community in South Africa, a developing country. To identify the social-cultural factors four focus groups consisting of men and women between the ages of 18 and 60 were conducted. A combination of the Health Belief Model (HBM) and Theory of Reasoned Action (TRA) provided a theoretical framework for this study. Thematic analysis was used to identify themes that emerged from the focus groups and participant observation. Through conducting these focus groups, themes emerged which strongly highlighted the role of cultural norms, gender roles, the western medical model and traditional medicine in a woman’s decision to adhere to cervical screening. It was found that factors such as knowledge, fear and stigma that were previously found by research were also shared amongst this sample group. However it was found that spiritual and religious beliefs (traditional healers, religion, and balancing paradigms), gender beliefs, social construction and acceptance of disease were factors which not previously identified in a South African population group, played a large influence in a woman’s decision to adhere to cervical screening. This knowledge highlights the need to invest in public health outreach that has a culturally relevant approach for the population group being targeted. Our findings also indicate that women in a disadvantaged community need knowledge dissemination around cervical cancer which is both socially and culturally relevant and accepted. Keywords: Cervical cancer, cultural, social factors, Pap smear screening, South Africa, screening adherence, gender, traditional healing.

FRESH “SIMPLE” FISH IS EATEN AT SCHOOL WITH HELP FROM NUTRITIONAL PSYCHOLOGY: A SUCCESSFUL CASE FROM MARCHE REGION

F02. EXPO 2015 Hot Topics - Nutrition, development and well-being

Maria Cristina Manzini, Psicologa-Psicoterapeuta soci e responsabile settore educativo Albert s.a.s, Porto San Giorgio – Italy

The educational action “A journey to Robinson Island” is part of the “PappaFish” project, promoted by Marche Region in 2013/14 to increase fresh fish consumption in nursery and primary schools. The action focused on schools of 11 municipalities and was carried out by experts in psychology, marine biology, food technology and sustainability. The main aims were consistent with MIUR recommendations: to modify children’s attitude towards fish (one of the less liked foods in infancy); to boost a healthy diet; to enhance sustainable food consumption. Theoretical principles were based on life skills education models for the promotion of wellbeing. The tools and methods applied were the innovative element. The class group itself created the narrative of a journey to an island in-between the imaginary and the real world. The leading topics: correct nutrition, emotions and food, sustainable food habits, were intertwined with the narrative. This approach gave coherence to the intervention, integrating all the objectives in an organic whole. Four experiential hands-on meetings were carried out by a psychologist and a marine biologist for 4 months in 24 classrooms. Such actions were integrated with the teachers’ work. The results were outstanding: more than 90% of pupils ate fresh fish. This experiment is in harmony with Expo 2015, as it gives children the opportunity to improve food habits and become more responsible, while allowing them to regain cultural, ethical and social values.

ACCESS EARLY INTERVENTION: AN E-HEALTH SOLUTION TO CHILDHOOD BEHAVIOURAL DISORDERS

E06. Health and clinical intervention - Family treatments

Jessica Kirkman, University of New South Wales, Sydney - Australia
Mark Dadds, University of New South Wales, Sydney - Australia

In Australia, less than 24% of children with behavioural and emotional problems access evidence-based interventions (Sawyer et al., 2000). In rural areas, access rates are even lower, and mental health services are simply not available. Treatment in the city can involve significant travel and time away from home, and services can only be brief and intense. The current project involves the development and preliminary evaluation of Australia’s first online treatment for parents of children with behavioural disorders. Parents of children with conduct problems received either in-person parent training or parent training via an e-health platform. The e-health program requires families to watch video modules, before connecting with a psychologist through videoconference each week. The study compares processes and outcomes associated with in-person treatment-as-usual versus the e-health treatment. Specifically, it compares parents’ and therapists’ acceptability, satisfaction, and attitude towards the two treatment modalities, as well as, the therapeutic alliance formed, changes in parenting knowledge and confidence, and finally, improvements in child behaviour problems. It is estimated 60 families will complete treatment, including follow up assessment. The project takes the first steps in making a well-established and evidence-based treatment available to thousands of rural families who currently have no access to help. Preliminary findings will be presented and discussed.

PSYCHOLOGICAL HELP TO THE REPRESENTATIVES OF DIFFERENT PROFESSIONAL GROUPS WHO EXPERIENCE SUBDEPRESSIVE STATE OF BURNOUT

E01. Health and clinical intervention - Assessing and accrediting quality of psychotherapy training and practice

Nadezhda Vlakh, Siberian Branch of the Institute of Economics and Law, Novokuznetsk - Russian Federation
Emma Meshcheryakova, Tomsk State University, Tomsk - Russian Federation

The research aim is to develop a model of psychodiagnostics and psychological support for people with subdepression in cases of job burnout. Research design. The integrative anthropological approach is the most suitable for representing aetio- and pathogenetic factors of subdepression in cases of burnout. Psychodiagnostic methods: Boyko Burnout Inventory, Maslach Burnout Inventory (MBI), Dodonov Emotional focus questionnaire, 16PF questionnaire (by R.Cattell), Langle’s Existential analysis. Methods of psychological support: Problem-oriented Therapy (Blaser A, Heim E., Ringer C, Thommen M, 1998), Existential counselling by Deurzen (2007), Balint groups of professional and personal growth. Statistic methods: correlation, dispersion methods and cluster analysis. The sample range of the survey were 968 people (doctors, teachers, businessmen and policemen), who asked for a psychological support at the Counselling Centre of Novokuznetsk, Kemerovskaya Oblast. The obtained results widen and deepen the scientific understanding of burnout syndrome within “support” occupations. It was proven that subdepressive disorders in the case of burnout indicate the state of personal and communicative sphere of a person employed in a “support” occupation. It was revealed that a wider circle of subdepressive disorders is typical for people with an ill-formed personal-communicative sphere, and therefore, this is the reason for their low stress tolerance. The predicting factor of a decrease of subdepressive symptoms in case of burnout was the appearance of existential life purposes. The process of psychological treatment brings a positive improvement in the system of life-purpose orientation, relationship systems, and the widening of the self understanding sphere and existential issues of professional activities. The research data is used by clinical psychologists and psychotherapists. It can be used in work with four groups of professionals: doctors, teachers, businessmen and policemen. As a result, for the first time, original models of psychological support of representatives of “support” occupations with subdepressive disorders in cases of burnout have been formed and the efficiency of these models was checked. Psychological support aims to restore the life-purpose orientation of self understanding as a criterion of personal growth and for understanding personal existential problems.

TRAUMATIC EXPERIENCES AND PSYCHOLOGICAL DISTRESS IN A SAMPLE OF FACEBOOK USERS

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Olga Bogolyubova, Saint Petersburg State University, Saint Petersburg - Russian Federation
Yanina Ledovaya, Saint Petersburg State University, Saint Petersburg - Russian Federation

Social networking sites are immensely popular among Internet users. People spend a vast amount of time communicating via social networking sites and applications. As a result, social media both reflects and creates the new reality of expression and communication. For psychologists, social media is becoming a new and exciting source of data concerning people's behavior, calling for novel approaches to data collection and analysis. We argue that social networks can be a source of data on mental health and well-being. The study reported here was aimed at assessing the connections between traumatic experiences online and offline, aggressive online behavior, and mental well-being of adults. The data was collected by means of an online survey instrument targeting Facebook users in Russia and U.S. Here we present preliminary data on the prevalence of exposure to online and offline violence in this sample in connection with self-reported symptoms of psychological distress. We also explore psychological factors associated with online aggression perpetration in this sample.
Various researches showed evidences that relationships between students and teachers are central to promote mental health at school (Pianta, 2001). Students who create and maintain close relationships with teachers are more attached and motivated to school and get along better with peers (Hamre & Pianta, 2006). Although longitudinal studies analyzed student-teacher relationships across school age stages, little is known on memories and emotions of adults related on past school relationships with teachers and how these memories affected achievements and adults’ life. The study analyzed memories of school experiences in 96 adults (33 males and 63 females) ranged from 19 to 80 years old (mean age=33 years). Individual interviews were conducted exploring interpersonal relationships with teachers and their emotional experiences during schooling years. Participants also reported the various ways in which these memories affected achievements over their life. Qualitative and quantitative analysis were run to analyze events and emotions. Results showed that positive and negative school experiences with teachers were still bright in adults’ memories. Positive and negative impacts were not limitated on achievements during schooling years but also school experiences and memories affected self-efficacy, motivation and decisions in many areas of their life.

BEHAVIOURAL AND PHYSIOLOGICAL EVIDENCES DURING MATERNAL CARRYING

B10. Development and education – Parenting

Maria del Carmen Rostagno, University of Trento, Rovereto – Italy

Introduction: Mother-infant bond is the earliest and most critical social relationship of mammalian infants. To promote this bond, infants have innate behaviors to seek maternal proximity and protest upon separation. This behaviors are fundamental for infants’s survival and for the establishing of a good mother-infant relationship. In this study, we are interested in how infants behave from a physiologica and behavioral point of view during one of the most important caregiving behaviors: carrying (infant held by the mother while walking). Methods: We asked 13 mothers with their babies (1 - 6 months) to sit (holding) and to walk (carrying). Task consisted of repetition of holding (5 minutes) and carrying (10 minutes). We analysed the amount of voluntary movements, presence of crying, and the Interbeat Interval (IBI), which is the amount of time between each heartbeat, of the infant. Results: In our preliminary analyses we find out that babies reduce the amount of voluntary movements, the episodes of crying and the IBI during carrying. Discussion: The present study provides implications for parenting practices: the calming effect obtained by carrying could be use in different situations (vaccinations or frightening noises). Additionally, the carrying might be utilized in evaluation of some disorders such as Autism Spectrum Disorders (ASD): infants with ASD are reported to have difficulties in cooperative adjustment of their body to parental holding.
THE EFFECTIVENESS OF TRAINING, STRESS MANAGEMENT SKILLS, LIFE SATISFACTION OF EMPLOYED WOMEN

E06. Health and clinical intervention - Family treatments

Sadrollah Khosravi, Islamic Azad University, Firooz Abad - Iran
Masoumeh Hamidi, Islamic Azad University, Yasouj - Iran
Jantab Hadi Zadeh, Islamic Azad University, Bushehr - Iran
Tayebeh Shahrivar, Islamic Azad University, Shiraz - Iran

Introduction: Life satisfaction can be used as a more comprehensive assessment of the living conditions of its people consider the different factors that contribute to. Materials and Methods: In this study, pre-test - post-test control group. Doing research for 30 Female employees working in the Health Network city Firuzabad had lower life satisfaction scores and randomly assigned to control and experimental groups. Groups during eight 90-minute sessions of stress management training (Sarah McNamara) were, following completion of the training sessions of both life satisfaction questionnaire Diener (1985) were taken. All data analysis and repeated measure analysis of covariance was used. Results: The results showed that after 8 Training sessions and the three-month follow-up between the two groups, there are significant differences in terms of life satisfaction (p <0.001). Conclusion: The results of this study can be concluded that stress management is important in life satisfaction. Keywords: stress management - life satisfaction – working women

“WE NEED TO BELONG SOMEWHERE” CORRELATIONS BETWEEN SOCIAL FACTORS AND PROBLEMATIC INTERNET USE AMONG 14-24 YEARS OLD GIRLS

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Dóra Katalin Prievara, University of Szeged, Szeged - Hungary
Bettina Pikó, University of Szeged, Szeged - Hungary

Previous studies indicated that sufficient social relationships might lead to dependency to the virtual world, e.g., social networking sites. The main goal of our research was to investigate the connection between shyness, loneliness, need to belong, perceived social support and problematic internet use (PIU) among girls from high school and university. 381 participants gave answers to our online, anonymous questionnaire. Based on correlation and multiple regression analyses, we found a positive significant relation \((p < 0.05)\) between the PIU and the need to belong scale. The results also revealed positive significant relationships between shyness and loneliness with the PIU and also with the 3 subscales of the PIU: control, neglect and obsession \((p < 0.01)\). There was a negative correlation between perceived support from the best friend and PIU \((p < 0.05)\). There was no significant association between the social factors and the amount of time spent on the internet or the different online activities. One possible explanation would be that these adolescents and young adults may go online to find the missing social support. They try to replace the offline relationships with online ones which can make them addictive to the cyberspace where they feel themselves as socially accepted and beloved persons. Especially shy girls are sensitive to spend too much time online because they find hard to control internet use while they may neglect other tasks or real relationships.
THE RELATIONSHIP OF ENVIRONMENTAL, PERSONAL AND EVENT RELATED FACTORS WITH POST-TRAUMATIC GROWTH IN CANCER PATIENTS

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Zümrüt Bellur, Mersin University, Mersin - Turkey
Arzu Aydin Aci, Mersin University, Mersin - Turkey

Although traumatic events cause some long lasting problems in some people it is the opposite for some others. Tedeschi and Calhoun (1996) defined the term of post traumatic growth (PTG) as the positive psychological changes experienced as a result of trying to cope with life threatening events. Schaefer and Moos (1992) in their model of PTG stated that; environmental and personal factors effect life crises and outcomes of these crises. The aim of this study is to examine the effects of environmental, personal and event related factors on PTG in breast cancer (BC) patients. Environmental factors include the perceived social support and dyadic adjustment; personal factors include self-blame, self-efficacy, cognitive processes, coping styles; event related factors include previous trauma experience, and perceived severity of the illness. Almost 200 participants will be recruited from the hospitals in Mersin, İzmir, Gaziantep, Bursa and Adana. The questionnaires will be administered to the participants by the researcher. PTG Inventory, Ways of Coping Inventory, Dyadic Adjustment Scale, The General Self-Efficacy Scale-Turkish Form and other scales will be used. Data will be analyzed with related statistical programs. After the analysis the results will be discussed in the light of the related literature. This study is important because the effect of marital adjustment and marital satisfaction on PTG in BC patients is an issue which is not well studied with Turkish samples.
The aim of this study was to compare social adjustment between ordinary and shahed students in Yasouj. The sample consist of 100 shahed students that was purposive sampling selected and compared with 100 ordinary students, from Yasouj. To assess Social adjustment, Bell Social adjustment Questionnaire(1961) was used. The result of t test analysis revealed that with regard to Social adjustment, there is a significant difference in shahed students and ordinary students. Which means that the level of Social adjustment in ordinary students was higher than shahed students. Key words: social adjustment, shahed student, ordinary students

NEW LOOK AT THE OLD PROBLEM: ANIMAL EXPLORATION FROM THE PERSPECTIVE OF ACTIVITY THEORY

A16. General issues and basic processes – Other

Elena E. Sokolova, Moscow State University, Moscow - Russian Federation
Elena Yu. Fedorovich, Moscow State University, Moscow - Russian Federation

Developing ideas of activity theory (A.N. Leontiev et al.), authors subject the traditional views on animals’ exploration (Expl.) in terms of binominal scheme (S-R) to the critical analysis, and give scientific credence to the new look at the nature of the animal behavior in the situations of novelty. Expl. in animals is understood primarily as a response to the novelty, and the novelty itself is assumed to be an physical changes in the environment. Such a view means the dichotomization of the single process of Expl., to the rupture between subjective and objective sides of it, to the attempts of investigating them separately and to the studies of Expl. in the conditions lacking ecological validity. Our empirical research on some rodent species have given evidences that the function of Exp. in animals should not be regarded as “collecting of information about” the objects by particular specimen but as his search for opportunities of action (affordances) towards objects. Expl. should be regarded as a “functional organ” of the animal activity as a whole (including motives, intermediate goals, conditions etc.), where its elements of the different levels are temporarily united to solve the task adjusting this activity to the certain environment. Orientation function of this activity in animals exists only through and in the course of performing the current tasks of their living. Consequently, “the novelty” should be regarded as a function of subject-object interaction.
O502
PREDICTORS OF MARITAL ADJUSTMENT: POSITIVE ILLUSION, REJECTION SENSITIVITY AND NARCISISM

A14. General issues and basic processes – Personality

Olcay Bozkuş, Mersin University, Mersin - Turkey
Arzu Araz, Dokuz Eylül University, Izmir - Turkey

The developing literature of narcissism which relies on clinical theories suggests that there are two different types of narcissism: overt and covert narcissism. Although there is a broad literature about rejection sensitivity, positive illusions and narcissism separately, the relationships of these variables are not studied yet. The main purpose of this study is to examine the mediating role of positive illusions (about self and spouse) and rejection sensitivity in the relationship between two subtypes of narcissism and marital adjustment. The data was collected via convenience sampling from 205 participants who are married at least for 1 year. The participants completed related questionnaires. Structural Equation Modeling analyses result in reasonable goodness of fit statistics. The results revealed that, covert narcissism predicted the rejection sensitivity positively and in turn rejection sensitivity predicted perceived marital adjustment negatively. Covert narcissism negatively predicted the positive illusion about spouse that is defined according to the ideal spouse criterion which predicted the perceived marital adjustment positively. In addition, whereas positive illusion about spouse defined according to the typical spouse criterion, predicted the perceived marital adjustment positively; positive illusion about self predicted the perceived marital adjustment negatively. The results were discussed with regard to the findings from the literature.

BENEFITS OF DISTRACTION

A12. General issues and basic processes - Intelligence and cognitive functioning

Johannes von Gehlen, University of Innsbruck, Innsbruck - Austria
Pierre Sachse, University of Innsbruck, Innsbruck - Austria

From research concerning working memory we've learned that our cognitive capacities for external stimuli are limited (Cowan, 2001; Bleckley et al., 2003; Kane et al., 2001). That, among other things, means that we can't attend all of them at the same time (Simons & Chabris, 1999). In a study (N=96) we showed that even ignoring them costs attentional capacities and impairs our abilities to concentrate (F=6.334; p=.003; \(\eta^2=.120\)), but also leads to a cognitive activation resulting in increased performance in a follow up task (F=2.783; p=.034; \(\eta^2=.068\)). According to arousal theory, we assumed that extraverts and introverts process external stimuli differently and conducted a second experiment (N=76) to examine how they'd react to distraction. Like in the first experiment distraction was caused by an irrelevant auditory stimulus that implemented a high cognitive load while participants were attempting to remember the contents of a text. Extraverts showed a greater increase in performance (T=-2.129, p=.045) than introverts (T=-.575, p=.571) in a consecutive task leading to the conclusion that extraverts benefit more from cognitive activation through external stimuli than introverts do.
Social Norm and Sexual Aggression in India: The Role of Collectivism and Rape Myth Acceptance

Svenja Dorothee Schnabel, Universität Bielefeld, Bielefeld - Germany

Sexual violence is a global issue, but it is especially an issue in India. This is facilitated by victim-blaming attitudes such as rape myths. Rape myths are defined as beliefs about rape that serve to deny, trivialise or justify sexual aggression of men against women. Former research indicates that rape myth acceptance (RMA) of others operates as a social norm and affects men’s rape proclivity (RP). To extend these findings, this study is replicated in the Indian context taking into account the collectivistic attitude. In the experiment, Indian students (total N = 168) firstly reported their own RMA. Following, the subjects received manipulated feedback about the alleged responses of their peer group. Depending on the experimental condition, the level (low vs. high) of the RMA-feedback was varied. Afterwards, their RP was assessed using acquaintance-rape scenarios that were adapted to the Indian context. Additionally, the collectivistic attitude of the subjects was measured. Results show that RMA correlates significant with the self-reported RP and is a significant predictor for sexual aggression. Also, we find that a higher RMA-Feedback leads to a higher self-reported RP. These results replicate the findings of Bohnet et al. (2006) in the Indian context, but show in addition that the RMA-Feedbacks effect on RP is stronger especially within men with a high collectivistic attitude. Theoretical implications and conclusions for follow-up studies will be discussed.

BODY DISSATISFACTION AND ITS RELATIONSHIP WITH PSYCHOLOGICAL PROBLEMS IN UNIVERSITY STUDENTS OF LAHORE, PAKISTAN

Mishal Tariq, University of the Punjab, Lahore - Pakistan
Tazvin Ijaz, Government College University Lahore, Lahore - Pakistan

Body dissatisfaction (BD) is an attitudinal disturbance, in which an individual perceives the body accurately but their reaction is of disapproval and displeasure. As BD is an attitudinal construct, it appears to be related to psychological health. The present research was conducted to explore the relationship between BD and psychological problems in university students of Lahore, Pakistan. It was hypothesized that an increase in BD would indicate an increase in psychological problems. The instrument used to assess BD was the Body Areas Satisfaction Scale of the Multidimensional Body Self Relations Questionnaire. The Student Problem Checklist was used to assess the presence of various psychological problems, namely Sense of being Dysfunctional, Loss of Confidence, Lack of Self Regulation and Anxiety Proneness. The study was conducted on a stratified sample of 489 university students (Males = 254; Females = 235) of B.S. Honors, aged 17 – 24 years (M = 20.4; SD = 1.4). The result of correlation revealed a highly significant positive relationship between BD and psychological problems (r = .388; p<.001), that is an increase in BD was associated with increase in psychological problems. Cultural factors possibly causing BD are discussed. Further researches should aim to identify the factors causing BD specifically in the Pakistani culture, so as to reduce BD and consequentially avoid the development of associated psychological problems.

THE IMPACT OF POSITIVE ORGANISATIONAL FACTORS ON THE CAREER SUCCESS OF BLACK EMPLOYEES IN THE SOUTH AFRICAN WORK ENVIRONMENT

F01. EXPO 2015 Hot Topics - Capacities building and human development

Shayne Roux, Stellenbosch University, Stellenbosch - South Africa
Johan Malan, Stellenbosch University, Stellenbosch - South Africa

The aim of the study was to develop and evaluate an exploratory theoretical model containing the most salient latent variables impacting subjective career success of black employees in the South African work environment. A mixed-methods exploratory sequential research design was employed with a total of 668 respondents. The study consisted of a qualitative phase, followed by two quantitative phases. A sample of 30 participated in semi-structured interviews during the qualitative phase, of which the purpose was to seek confirmation that the instruments utilised covered the most salient themes and to supplement themes not adequately covered by the instruments. The purpose of next phase was to pilot-test the composite questionnaire. A total of 220 usable questionnaires were analysed with regard to the psychometric properties of the constructs. The purpose of the last phase was to evaluate thirteen propositions guiding the study. A total of 418 usable questionnaires were analysed. During this phase, the psychometric properties of the instruments were confirmed, as well as the goodness-of-fit of the structural model. All of the paths in the final model were significant. The results of a step-wise multiple regression analysis revealed that job resources, psychological capital and supportive organisational climate were the most significant predictors of career success. The study has various implications for career management which will be outlined in a separate presentation.

ASSESSMENT FOR LEARNING AND COMPETENCY ASSESSMENT: PROBLEMS IN THE CASE OF NON-WRITTEN SOURCES UNDERSTANDING ASSESSMENT

B03. Development and education - Learning and instruction

Helena Hernansaiz-Garrido, Autónoma University of Madrid, Madrid - Spain
Jesús Alonso-Tapia, Autónoma University of Madrid, Madrid - Spain

An educational objective is that students can interpret the information contained in non-written sources (NWS), as these help understand their societies of origin, but this competency is usually neither taught nor assessed. Our aim is to analyse how teachers assess the degree of NWS understanding to help their students. We developed a model of NWS understanding in Social Sciences Learning, which includes a set of questions that students should ask themselves to analyse a NWS and questions related to different aspects – demographic, technical, scientific, etc.– of a society, for which they should provide plausible hypotheses. We asked 148 primary school teachers who were receiving formal education to become secondary school counselors to design tasks to adequately assess the understanding of two NWS so that they could help their students. Results showed that the proposed tasks correspond to different profiles, some of which fit the model; but, in general, teachers' assessments are unsystematic and include questions irrelevant for testing understanding and ambiguous questions. These results are similar to those found for other competencies – text, table and graph understanding, conceptual and causal understanding in history, use of scientific thinking, etc. These facts prevent to detect students' difficulties and to give them a suitable feedback. Consequently, some changes should be made in teacher education in order to foster students' competency for NWS understanding.
O520
INVESTIGATION OF EDUCATIONAL ORGANIZATIONS’ COMPETITIVENESS IN THE CONTEXT OF ORGANIZATIONAL CULTURE DEVELOPMENT

D12. Work and organization - Safety culture and climate

Liudmyla Karamushka, Institute of Psychology, Kiev - Ukraine
Sergei Maksimenko, Institute of Psychology, Kiev – Ukraine
Oksana Kredentser, Institute of Psychology, Kiev – Ukraine
Karina Pentsak, Institute of Psychology, Kiev – Ukraine

The objective of our investigation was to find out correlations between the levels of educational organizations’ competitiveness and the levels of their organizational culture. The theoretical foundation were the works by L.Karamushka, V.Korsakevich, O.Fil, and others. Method and design. The instruments used included I.Ladanov Evaluation of Levels of Organizational Culture, V.Rozanov Assessment of Organization’s Competitiveness, and SPSS (v. 13). The sample was made up of 355 teaching staff of secondary schools from Kyiv region. Results: 1. The investigation found that 38% and 5.2% of educational organizations had high and low levels of competitiveness respectively, and 56.8% of educational organizations had the average level of competitiveness. 2. The levels of educational organizations’ competitiveness positively statistically significantly correlated with the levels of their organizational culture (r=0.285, ρ<0.001). 3. The levels of educational organizations’ competitiveness positively correlated with the levels of development of all components of organizational culture - work (r=0.210, ρ<0.001), communication (r=0.254, ρ<0.001), management (r=0.215, ρ<0.001), and motivation and morality (r=0.311, ρ<0.001). Conclusion. The investigation found educational organizations to have low levels of competitiveness and educational organizations’ competitiveness to be an important determinant of their organizational culture.
O521
A CONTEXTUAL SUBJECTIVE PERSPECTIVE ON RESILIENCE ASSESSMENT

E09. Health and clinical intervention - Positivity and well-being

Helena Hernansaiz-Garrido, Autónoma University of Madrid, Madrid - Spain
Rocio Rodriguez-Rey, Autónoma University of Madrid, Madrid – Spain
Jesús Alonso-Tapia, Autónoma University of Madrid, Madrid – Spain
Miguel-Ángel Ruiz-Diaz, Autónoma University of Madrid, Madrid – Spain
Carmen Nieto-Vizcaino, Autónoma University of Madrid, Madrid – Spain

As it has been noted, resilience is not an “all or none” construct. On the contrary, it can be shown in front of a kind of adversity but not in front of others, and it can also be shown in a different degree in each situation. Despite this, there has been little interest in developing a measure of adult resilience in different contexts. For this reason we aimed to develop and validate a contextual subjective resilience questionnaire for adults. We developed a 20 item scale that had a response format of a 5-point Lickert scale and which took into account five different problem areas—work, close persons’ relationships, own health, close persons’ health and economy—. It was completed by 416 adults, along with CDRISC10 for validation purposes. We then conducted a confirmatory factor analysis of a “5 specific x 1 general” factor model using AMOS, and we also performed reliability and correlation analyses. Results show that the 5x1 factor structure is well defined (X2/df=2.06; GFI=.93; CFI=.95; RMSEA=.05). The general scale has an excellent reliability (α=.90) as well as the subscales (ranging from α=.71 to .83). The correlation between the general scale and the CDRISC10 indicates an acceptable validity (r=.45). From these results derive some important implications for research and intervention, such as the vital need of assessing resilience in different contexts and of researching the resilience-promoting processes which are most adequate for each one.
O522

ADOLESCENT ANTISOCIAL BEHAVIOUR: THE INTERPLAY BETWEEN PERSONALITY AND GENDER

B08. Development and education - Bullying and aggression

Alice Murteira Morgado, University of Coimbra, Coimbra - Portugal
Maria da Luz Vale Dias, University of Coimbra, Coimbra - Portugal

During adolescence there may be changes in personality associated with psychosocial development, influencing the involvement of individuals in different social interactions. In order to deepen our understanding of gender differences on adolescent antisocial behaviour and verify what personality characteristics may facilitate antisocial tendencies in boys and girls during this developmental stage, a sample of 489 Portuguese students were asked to fill Youth SelfReport and Eysenck’s Personality Questionnaire for Children, while their parents filled Child Behaviour Checklist. Results confirm the existence of significant differences between boys and girls in personality and antisocial tendencies, and differences in personality between individuals with lower and higher antisocial tendencies. The role of psychoticism on antisocial behaviour indicates a possible mediating effect of impulsivity on the relation between gender and antisocial behaviour in adolescence. This research brings important conclusions to the study of the antisocial phenomenon in adolescence, especially regarding what is behind the well acknowledged gender differences on antisocial tendencies, in particular regarding psychoticism which may be the reason why boys – who score significantly higher in this trait – are more prone to engage in antisocial conducts, at least during this developmental stage.
A CONTEXTUAL PERSPECTIVE ON COPING ASSESSMENT

E09. Health and clinical intervention - Positivity and well-being

Helena Hernansaiz-Garrido, Autónoma University of Madrid, Madrid - Spain
Rocío Rodríguez-Rey, Autónoma University of Madrid, Madrid – Spain
Jesús Alonso-Tapia, Autónoma University of Madrid, Madrid – Spain
Miguel-Ángel Ruiz-Díaz, Autónoma University of Madrid, Madrid – Spain
Carmen Nieto-Vizcaíno, Autónoma University of Madrid, Madrid – Spain

Although taking the situation into account can improve the explanatory power of tests, most research on coping assessment –not clinical practice– has focused on coping as a general personality trait and, consequently, has ignored the effect of the context. Thus, we aim to develop a contextual coping questionnaire for adults.

After reviewing previous coping studies and measures, we developed a 40 item scale with a response format of a five-point Likert-type scale. The scale considered five different problem areas – work, close person relationships, own health, close person health and economy – and eight coping strategies – rumination, emotional expression, isolation, self-blame, help-seeking, solution-seeking, positive thinking and thinking avoidance –. The scale was completed by 416 adults. Confirmatory factor analyses were carried out with AMOS to compare a basic model –which did not consider the context– to a nested model –which considered it–. Reliability analyses were also conducted. The analyses yielded good reliability indexes (α=.78 for the complete scale and ranging from α=.71 to .88 for the coping strategies subscales). The nested model fit was acceptable (X2/df=2.49; GFI=.82; CFI=.86; RMSEA=.06), and better than that of the basic model (X2/df=3.24; GFI=.77; CFI=.77; RMSEA=.07). These results emphasise the importance of considering different contexts when assessing coping strategies for designing interventions to improve health and well-being, since coping strategies are conditioned to the situation.
A STUDY OF STRESS, COPING STRATEGY AND LIFE SATISFACTION AMONG UNDERGOING TREATMENT AND RECOVERED BREAST CANCER PATIENTS

Mishal Tariq, University of the Punjab, Lahore - Pakistan
Rooma Fayyaz, Kinnaird College for Women, Lahore - Pakistan

Breast cancer is a physically and psychologically traumatic illness, with high prevalence in Pakistan. The present study aimed to compare and explore the relationship between stress, coping strategy used and life satisfaction among female breast cancer patients who were undergoing treatment and those who had recovered from the illness. The participants were assessed using a demographic questionnaire, Perceived Stress Scale, Ways of Coping and Satisfaction with Life Scale. The study was conducted on a purposive sample of 60 breast cancer patients (undergoing treatment = 30; recovered = 30); aged 22-60 years (M = 35.8; S.D. = 11.6). The result of the Independent Samples t-test (p<.001) revealed that stress levels were significantly higher in breast cancer patients undergoing treatment. The recovered patients used active coping more frequently, while the patients undergoing treatment adopted a passive coping strategy. The patients undergoing treatment were significantly less satisfied with their lives. Moreover, the correlation analysis revealed that increase in stress was associated with increase in passive coping, decrease in active coping and decrease in life satisfaction (p<.001). Although breast cancer and its treatment are quite painful, enabling patients to adopt an active coping strategy can help them cope more effectively with their illness, and consequentially decrease their level of stress and improve life satisfaction.
**O530**

**DOMESTIC VIOLENCE IN USERS AND NONUSERS OF ILLEGAL DRUGS**

F03. EXPO 2015 Hot Topics - Consumer behaviour

Patricia Martínez Lanz, Universidad Anáhuac México Norte, Mexico City – Mexico
Alejandro González, Universidad Anáhuac México Norte, Mexico City – Mexico
Diana Betancourt Ocampo, Universidad Anáhuac México Norte, Mexico City – Mexico

The main purpose of this research was to determine the differences in domestic violence between users and nonusers of illegal drugs. A nonrandom sample of 791 adolescents and young adults were selected, with an age range of 12-35 years of age (M = 18.74, SD = 6.94), of which 41.7% were male and 58.3% female. It was used a measuring scale of domestic violence with 16 items that comprise the following areas: verbal aggression, physical aggression, humiliation and respect. It is a Likert scale with four response options (from Never to Always) (α = 0.72). Regarding to illicit drug use, 12 indicators were used to assess consumption ever in life of the following drugs: amphetamines, inhalants, marijuana, hallucinogens, cocaine and heroin, as well as age of first use. The results showed that 12.4% of participants reported the use of some type of illegal drug, of which 47% were male and 53% female. The drugs consumed more frequently were marijuana (8.6%), followed by inhalants (6.4%), amphetamines and cocaine (2.6% respectively), hallucinogens (2.3%) and heroin (1.3%). Domestic violence was reported as follows: OJO. In order to realize the analysis of domestic violence between those who have and have not used illegal drugs, similar number of subjects were considered for the correlation of proportional samples of the population. A t test for independent samples was conducted. The results showed statistically significant differences (t = -3.19, p <.01) since those whom have used illegal drugs scored higher on family violence (M = 8.16, SD = 5.65) in contrast to those whom have not consumed any (M = 5.56, SD = 4.60).
THE TRANSITION FROM YOUTH TO ADULTHOOD AND THE IMPORTANCE OF HOPE AND LIFE GOALS

Jan Broedslev Olsen, Aalborg University, Aalborg - Denmark
Claus D. Hansen, Aalborg University, Aalborg - Denmark

It is widely accepted among scholars (Erikson, Levinson, Arnett, Marcia) that the transition from childhood to adulthood is a life-period in its own right and with its own developmental efforts and tasks. It is therefore obvious that hope and life goals must play an important role in this period. The presentation examines the possible links between hope defined as ‘a positive motivational state’, the major life goals young adults have set themselves and their socioeconomic background. The presentation is based on the longitudinal study “The West Jutland Cohort Study”, a birth cohort study of all adolescents born in 1989 (n=3,054) living in Ringkjobing County, Denmark in 2004. The third wave of the study included the Trait Hope Scale (Snyder 2002) as well as several items tapping into the major life goals that the young adults were pursuing at age 20/21. The results show clear socioeconomic differences: young adults with a family of origin with low parental education have a lower score on the trait hope scale. What appears to be most important for high-hope score is feeling energetic and full of life and being admired and having a good sex life also show relatively strong associations with hope. The presentation argues that it is not irrelevant what major life goals young adults strive to achieve, and that their ability to perceive a path to realize these goals (i.e. being in a hopeful state) depends not only on the goals they strive for but also their socioeconomic background.
Given the rise of higher education graduates in Portugal and changes in work relations, we presented in previous papers the theory of ‘an employment’, as a new framework to study, in an integrated way, the experience of work over time, alternating atypical/precarious work relations and unemployment in graduate’s careers (Araújo, Castro & Jordão, 2011; 2013). ‘Anemployment’ impacts have been documented: Degradation of Salaries/Payments; Taxes/accrued expenses/loss of social benefits; Fear of unemployment; Peaks of hard work opposed to moments without work; Accumulating multiple jobs; Accepting work below educational level; Postponing life projects; Geographic mobility; Feelings of frustration/injustice/anxiety. (Araújo, Castro & Jordão, 2014). In this paper, we explore the strategies graduates use to deal with anemployment, obtained from audiotaped semistructured interviews that were transcribed, coded and categorized in NVIVO software, using Grounded Theory approach. Although the study is ongoing, early results document that graduates use several strategies, for example: increasing qualification (education/professional training), moderating expectations towards the future, adopting a new life philosophy (“Zen”, “Lean”, “Less is more”), greater financial control and savings, increasing positive emotions of hope and optimism, focusing on the positive view of life. We hope our research allows future societies to conceive and implement employability interventions for graduates.
O533
IS UNEMPLOYMENT NOW MORE ‘ACCEPTABLE’? DIFFERENTIAL PERCEPTION OF UNEMPLOYMENT AND PSYCHOLOGICAL DIMENSIONS

D06. Work and organization - Labour market, unemployment and flexicurity

Anne Pignault, University of Luxembourg, ECCS, Institute of Lifelong Learning & Guidance (LLLG), Walferdange - Luxembourg
Claude Houssemand, University of Luxembourg, ECCS, Institute of Lifelong Learning & Guidance (LLLG), Walferdange - Luxembourg

Subjective feeling about being unemployed would be now less negative than in previous years (Bourhis&Wils, 2001; Cultiaux&Vendramin, 2010). Some years ago, Galland (2000) put forward the hypothesis that the statistical increase of unemployment could lead to its relative normalisation. We hypothesise jobless people would experience changes in their situation less adversely and it would be then interesting to find what determine people to normalise or not this situation. 607 unemployed people in Luxembourg completed the French version of coping scale (Way of Coping Checklist - Revised, Cousson, 1996), a scale of locus of control (Meyers &Houssemand, 2005), one of centrality of work (Gringas&Chagnon, 1997), some items allow the definition of the professional trajectories and career path (Dupuy, Le Blanc, &Mégemont, 2006) and a scale of unemployment normalisation (Pignault&Houssemand, 2013). The participants’ career path and centrality of work did not influence their representation of the unemployment. But external locus of control (r=.34, p<.001) and emotion-focused coping style(r=.32, p<.001) are positively correlated with unemployment normalisation. These first results highlight the interaction between unemployment normalisation and other unemployment-related dimensions. We will now pursue this study and test the impact of the level of unemployment normalisation on subjective well-being, job search, the chances of being (re)employed and the quality of this employment.
O534
THE ROLE OF SEXIST ATTITUDES AND PERSONAL VALUES IN SELF-OBJECTIFICATION PROCESSES

C03. Culture and society - Sex and gender

Norma De Piccoli, University of Turin, Turin - Italy
Angelica Cinicola, University of Turin, Turin - Italy
Chiara Rollero, Università Telematica e-Campus, Novedrate (CO) - Italy

Self-objectification occurs when people treat themselves as objects to be viewed and evaluated based upon appearance. Literature has largely shown that self-objectification leads to relevant damaging outcomes (e.g. body shame, dissatisfaction and appearance anxiety, negative mood, depression, disordered eating, and sexual dysfunction). The purpose of this study was to extend past research on predictors of self-objectification (Fredrickson & Roberts, 1997), driving the attention to a) personal values which may foster self-objectification processes, and to b) endorsement of sexist attitudes that may guide the perception of one’s worth. Participants were about 400 male and female Italian undergraduates. They were given a questionnaire assessing self-objectification (body surveillance and body shame) (McKinley & Hyde, 1996), ambivalent sexism and sexist attitudes toward men (Glick & Fiske, 1996; 1999), and personal values (Vecchione, Schwartz et al., 2014). Data analysis is ongoing; ANOVA and regression analyses will be applied to show which values and which sexist attitudes (benevolent and hostile sexism towards women and men) constitute protective/risk factors in self-objectification processes. Data may help in interventions aimed at reducing the damaging consequences of objectification processes.
O537
ASSESSMENT OF NEEDS AND RESOURCES IN RENAL PATIENTS UNDERGOING DIALYSIS TREATMENT

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Rocío Rodríguez-Rey, Autónoma University of Madrid, Madrid - Spain
Helena García-Llana, Hospital Universitario La Paz, Madrid - Spain
Javier Barbero, Hospital Universitario La Paz, Madrid - Spain
Maria Auxiliadora Bajo, Hospital Universitario La Paz, Madrid - Spain
Rafael Sánchez-Villanueva, Hospital Universitario La Paz, Madrid - Spain
Gloria del Peso, Hospital Universitario La Paz, Madrid - Spain
Elena Sánchez-García, Hospital Universitario La Paz, Madrid - Spain
Rafael Selgas, Hospital Universitario La Paz, Madrid - Spain

In the field of nephrology there is a lack of instruments designed to evaluate the psychosocial profile of patients. The aim of this study is to adapt a semi-structured interview designed to assess needs and resources in patients with onco-haematological diseases (the CMAE-OH) to renal patients undergoing dialysis. We have conducted three studies. The first is an inter-judges study (N=10 experts) to determine its face validity. The second is a pilot study (N=10 patients), to know how the interview works when used in renal patients. The third consists of the usage of the tool in a larger sample (N= 54) to determine its preliminary psychometric properties. A high degree of agreement was found in the inter-judges study. The pilot and the validity studies allowed improving the tool. The instrument has 9 dimensions: information, medication and diet, social support, mental health, life events, personal resources coping and resilience, spirituality, learning and change, and advanced care planning. The preliminary psychometric properties were acceptable considering the nature of the semi-structured interview. Those studies portray that the tool we have adapted (the CMAE-NR) is useful to assess needs and resources in renal patients, as well as CMAE-OH was when used with onco-haematological patients. Our research suggests that psycho-oncology is closer to other fields of health psychology, so the advances in this area could be applied in other subdisciplines, such as psychonephrology.
O540

HOPE-CENTERED THERAPY: A TRANS-CULTURAL, INTERFAITH APPROACH TO BUILDING HOPE

F01. EXPO 2015 Hot Topics - Capacities building and human development

Anthony Scioli, Keene State College, Keene - United States
Wismick Jean Charles, University of Notre Dame at Port-au-Prince, Port-au-Prince – Haiti
Raza Abbas, Bahria University, Pathway Global Career Institute, Karachi – Pakistan

Few have heeded Jerome Frank’s (1968) seminal advice regarding the role of hope across every form of effective psychotherapy. In this presentation we will introduce Hope-Centered Therapy, an integrative, multi-level intervention that is applicable across cultures and faith traditions. We will include findings from several pilot studies conducted in the U.S., Haiti, and Pakistan. Hope–centered therapy is based on an integrative theory of hope (Scioli, 2007; Scioli & Biller, 2009). This approach subsumes a number of existing theoretical and therapeutic frameworks within psychology and philosophy (e.g., Erikson, 1972; Godfrey, 1997; Kohut, 1971; Marcel, 1962; Rogers, 2003; Snyder et al., 1991). Hope-Centered Therapy is an integrative, evidenced-based approach to conceptualizing, assessing and building hope that can be used across cultures and spiritual belief systems. Hope-Centered Therapy is a “whole-brain” approach, combining cognitive-behavioral exercises with philosophical reflections, and meditative-hypnotic exercises. Five modules are included in this intervention; two attachment modules, and one each for mastery, survival, and spiritual hope. Three outcome studies will be presented, involving the U.S., Haiti, and Pakistan. In general, the results demonstrate the efficacy of this approach to increase hope states at both the explicit (self-report) and implicit (projective test) level.
EVALUATION OF AN ATTEMPT TO PROMOTE QUANTITATIVE LITERACY IN INTRODUCTORY PSYCHOLOGY

William McConnell, North Island College, Courtenay - Canada
Yiling Chow, North Island College, Courtenay - Canada

Psychology students often express negative views of quantitative methods, which likely affects learning. In an attempt to enhance grasp of basic statistics, an hour-long active learning activity, rated favourably by students in a pilot, was introduced in a section of introductory psychology during the methods and statistics module. Working in pairs, 30 students generated 3-5 dishonest answers to 8 prepared questions, judged the veracity of their partner’s responses to these questions, rated their confidence in the accuracy of their judgments, counted their correct judgments, and calculated their mean confidence ratings. Students then observed the generation of descriptive statistics, bar charts, and a scatterplot for their data; calculation of the correlation between confidence ratings and accuracy in detecting truths and lies; and a t-test to determine if they detected deception better than chance. Learning was first assessed in a scheduled exam 2 weeks after the activity, with 30 students in a second section of introductory psychology forming a comparison group. While students in the active learning section performed significantly better than those in the comparison section on the methods and statistics module, there were no differences between the sections on the other examined modules. These findings were replicated in an unannounced informal assessment 8 weeks later, suggesting that the activity enhanced students’ grasp of rudimentary statistics.
ENHANCING ACTIVE CITIZENSHIP AND SOCIAL VALUES: A MULTISTAKEHOLDER PERSPECTIVE

The paper describes a project aimed at fostering active citizenship through the development of the environment. The promotion of rules of coexistence is a crucial aspect for institutions, that become more efficient in using available resources, with a reduction of waste. The consolidation of the civic sense, leads to the creation of social capital and the acquisition of benefits for the communities. In particular, the respect of civic values permits the citizens to reach individual goals and increase the quality of their life, through the interaction with others. According to this perspective, the paper presents an innovative training model oriented to enhance civic values in young generations (students between 11 and 14 years old). The model sees the involvement of the students and is composed by a first step of knowledge sharing about the history and cultural heritage and a second step of active citizenship (i.e. graffiti removal, parks cleaning, cultural voluntary...). The model pursues an idea of social economy and is based on two main principles: 1) a joint construction of the social demand by identifying civic lacks in young generations and the evaluation of social impact 2) the cooperation of private sector organizations, and public utilities for the implementation of the project itself. The contribution thus points out the methodology implemented for the detection of social needs, and the strategies used by the organizations in order to implement the intervention.
O553

APPLIED PSYCHOPHYSIOLOGICAL INTERVENTIONS FOR GENERALIZED ANXIETY DISORDER (GAD)

E05. Health and clinical intervention - Evidence based psychotherapies

Juan Jose Sanchez-Sosa, National Autonomous University of Mexico, Mexico City – Mexico
Edgar Salinas-Rivera, National Autonomous University of Mexico, Mexico City – Mexico

Introduction: Generalized Anxiety Disorder (GAD) is a highly prevalent mental health problem. In Mexico, its one-year prevalence is around 4% in the general population representing over 400,000 persons. GAD implies chronic, excessive, uncontrollable anguish, disproportionate physiological activation, extreme nervousness, worrying, irritability, all more severe in the presence of depressive symptoms and low interpersonal efficiency. Although applied psycho-physiological interventions have improved GAD's somatic symptoms, clinicians and researchers still need to examine if such effects can be improved in the context of integral cognitive-behavioral treatments (CBT). Objective. To examine the clinical efficacy of a multiple-response biofeedback training intervention in increasing the patients quality of life and significantly reducing anxiety and depressive symptoms. Participants: Thirty five patients with GAD and depression received nine biofeedback training sessions on six physiological responses. Results showed clear positive clinical and statistically significant changes in all psychological measures at post-treatment and at follow-up. The effects also decreased somatic activation on such responses as breathing amplitude and frequency, and muscle tension. Conclusion: Well integrated CBT and biofeedback procedures are an effective intervention option for GAD patients.
O555
COPING WITH OCCUPATIONAL STRESS IN PRIVATE ENTREPRENEURS AND TOP-MANAGERS IN RUSSIA

D04. Work and organization - Well-being at work

Tatiana Kryukova, Kostroma State University, Kostroma - Russian Federation
Olga Kovaliova, Kostroma State University, Kostroma - Russian Federation
Olga Ekimchik, Kostroma Technological University, Kostroma - Russian Federation

Goal: to identify specific coping ways in small-middle business owners and hired top-managers. Theoretical background is cognitive-behavioral approach to stress-coping processes in organizational setting (Cartwright & Cooper, Cox & Mackay, Fontana, Lazarus & Folkman, etc.), burnout syndrome (Maslach). Measures: interview; WCQ: Lazarus, Folkman, Russian adaptation T. Kryukova; MBI: Maslach & Jackson, Russian adaptation V. Oriol. Sample: 60 persons- 23 males, 37 females aged 25-50: 1) 30 top-managers, middle age 42; 2) 30 business owners, middle age 34. Findings 1. Both groups admit moderate stress as an integral part of their job helping mobilize. 2. Two groups differ in stressful situations’ ratings. Top-managers mention problems with subordinates (φ*=2.44, p≤0.006), interaction with a company owner/companions (φ*=2.81, p≤0.001), working environment (φ*=2.57, p≤0.004). Entrepreneurs mark organization finances difficulties (φ*=2.63, p≤0.003), cooperation with power/control authorities (φ*=1.99, p≤0.02), time deficit (φ*=2.72, p≤0.002). 3. Two groups have common coping tendencies: Planful problem solving, various Distraction-Avoidance strategies (sports, hobby, sleeping, time with loved ones, tourism, alcohol, driving, etc). There are some differences: entrepreneurs have a wider range of Distraction coping: extreme sports, singing and performing, public and charity activities, smoking, alcohol (φ*=2.49, p≤0.005). Top-managers are more engaged in handicraft, swimming, touring, meals, outdoor recreation. 4. Burnout is one of the key factors affecting job stress level and coping outcomes in business owners: Depersonalization subscale (MBI) is correlated with difficulties concerning subordinates (R=0.398, p<0.01), leading to disengaged coping (avoiding). Research limitations include the respondents’ resistance to blank assessment. Face-to-face interview has been more effective. Conclusion: different types and levels of entrepreneurs’ and top-managers’ responsibility and engagement determine the occupational stress-coping levels.
O556

ACHIEVEMENT MOTIVATION THROUGH “PEER EVALUATION” BY SPANISH STUDENTS

B03. Development and education - Learning and instruction

Consuelo Morán, University of León, León - Spain
José David Urchaga, Pontifical University of Salamanca, Salamanca - Spain
Antonio Sanchez-Cabaco, Pontifical University of Salamanca, Salamanca - Spain
Susana Rodríguez-Escanciano, University of León, León - Spain
Maria Reyes Martínez Barroso, University of León, León - Spain

The aim of this work was to find individual differences in two types of motivation (achievement and results) evaluated through “peer assessment” by Spanish students. Achievement motivation means to follow intrinsic goals to the task. Students with achievement motivation learning to Know, to master the jobs, increasing their skills and solve social problems. Students motivated by results pursue extrinsic goals to the knowledge, consider the study as a means to accomplishing some ulterior purpose, trying to maximize the yield with a minimum of effort. To evaluate both types of motivations, the Academic Goals Questionnaire was applied to 192 subjects (41% males) to evaluate two peer. ANOVAs made with the SPSS find robust differences on achievement motivation among sex and groups. We conclude that two types of motivation in the evaluation of pairs are identified (achievement and results). Women are higher in achievement motivation than males. The students of the Master in Psychology obtained the highest scores given by “peer assessment” in achievement motivation, being the students of the Master in Business Legal Advise which obtained the lowest score. We believe that it is necessary to continue implementing “peer evaluation” among students for those skills that are difficult to appraise by teachers. Despite the limitations of the study due to the dimensions of the sample, we hope that in the near future we will be able to expand its size.
The accuracy of teachers’ judgments (i.e., teachers’ judgment achievement) deeply affects the lives of students as well as the perceptions and decisions of parents, school psychologists, school administrators, and researchers. Importantly, the results of previous meta-analyses have suggested that teachers’ judgment achievement varies widely across studies and settings. We explore potential sources of heterogeneity in teachers’ judgment achievement by conducting new meta-analyses and probing for moderator (students’, teacher- and class characteristics). First, we present the results of a meta-analysis of lens model studies ($N = 156$) in which teachers’ judgment achievement is decomposed into knowledge, consistency and environmental components. Second, we present results of a psychometric meta-analysis of the studies included in a previous meta-analysis ($N = 1’820$) in which we correct for various artifacts (e.g., sampling error, measurement error) and publication bias. The current results suggest that previous meta-analyses have underestimated the overall level and overestimated the heterogeneity of teachers’ judgment achievement. In addition, the results suggest that teachers make less accurate judgments when judging students with learning disabilities and when making judgments related to mathematics. There was indication that teachers’ judgment achievement varied based on class level. We make recommendations for future research and discuss implications for teacher education.

“BEING PRESENT TO UNDERSTAND”. THE PSYCHOLOGICAL EXPERIENCE OF RELATIVES DURING CARDIOPULMONARY RESUSCITATION

E14. Health and clinical intervention - Disaster and crisis psychology

Carla De Stefano, AP-HP, Urgences-Samu 93, Hopital Avicenne, Université Paris 13, Sorbonne Paris Cité, UTRPP, (EA4403), Bobigny, France
Domitille Normand, APHP, Hôpital Avicenne, Service de psychopathologie de l'enfant, de l'adolescent, psychiatrie générale et addictologie spécialisée AP-HP, Hopital Avicenne, Bobigny, France
Leila Sahli, AP-HP, Urgences-Samu 93, Hopital Avicenne, Université Paris 13, Sorbonne Paris Cité, UTRPP, (EA4403), Bobigny, France
Thierry Baubet, APHP, Hôpital Avicenne, Service de psychopathologie de l'enfant, de l'adolescent, psychiatrie générale et addictologie spécialisée, Université Paris 13, Sorbonne Paris Cité, UTRPP, (EA4403), Bobigny, France
Frederic Adnet, AP-HP, Urgences-Samu 93, Hopital Avicenne, Université Paris 13, Sorbonne Paris Cité, Bobigny, France

Background: Relatives present at cardiopulmonary resuscitation (CPR) are at risk of experiencing emotional burdens. In a previous randomized controlled trial (RCT), we demonstrated that family presence was associated with an improved psychological outcome (lower PTSD symptoms).

Objective: To analyse the relatives’ experience of being present during CPR and explore the protective factors for PTSD.

Methods: Qualitative study involving 32 purposefully selected relatives, from the 570 enrolled in the RCT (present and not during CPR) from January 2012 to January 2013. Data were gathered through semi-structured interviews, which proceeded until data saturation was reached. Data were analysed according to Grounded Theory. NVIVO10 qualitative software was also used. Funding was by the French Ministry of Health.

Results: Three main themes were found: 1) “importance of feeling ‘actor’”, describing the feeling of agency and the need to be present with the patient; 2) “feeling reassured by ongoing and clear information” describing the positive role of receiving information during CPR and 3) “having the choice to be present”, describing the opportunity to choose to assist CPR as a facilitator for subsequent events.

Discussion: Feeling as an ‘actor’ seems to prevent suffering passively and enables making sense of the traumatic event. The clarity of communication and opportunity to choose to participate prevents feelings of helplessness and guilt, and facilitate mourning of their lost loved one.
O559

REACTIVE-PROACTIVE AGGRESSION AND PARENTING STYLES AS THE PREDICTORS OF CYBERBULLYING IN TURKISH ADOLESCENT SAMPLE

B08. Development and education - Bullying and aggression

Gamze Er, Mersin University, Mersin - Turkey
Rukiye Kızıltepe, Ege University, Izmir – Turkey
Aslan Karaaslan, Ege University, Izmir – Turkey
Büşra Yılmaz, Istanbul Ticaret University, Istanbul - Turkey

The rapid development of technology and usage of developing technology by children and adolescents brings with some problems. Cyberbullying is one of these problems and different variables which can be related to cyberbullying have been studied in the current studies. The purpose of the study is to examine the prevalence of cyberbullying and familiar-individual factors which are related to cyberbullying in Turkish sample. This study examines whether parental acceptance/involvement, parental strict/control, reactive and proactive aggression levels of adolescent predict the adolescent cyber bullying. Another purpose of the study is to examine the effects of gender and parenting styles (authoritarian, permissive/neglecting, permissive/indulgent and authoritative) on adolescent cyberbullying. Almost 350 adolescents who are between the ages of 13 and 16 will participate in this study. Adolescents will be asked to complete a number of questionnaires including The Revised Cyberbullying Inventory, Reactive and Proactive Aggression Scale, Child Rearing Styles Scale and Personel Information Form. After the analyses are completed the findings of the study will be discussed in the light of the current literature.
O567
THE COMPARISON OF RESILIENCY RATE AND MENTAL DISORDERS IN YOUNG OFFENDERS AT CENTERAL PRISON OF YASOJ

Sadrollah Khosravi, Islamic Azad University, Firooz Abad - Iran
Masoumeh Hamidi, Islamic Azad University, Yasouj - Iran

The purpose of this study was to compare the rate of resilience and mental disorders has been considered in different crims in young prisoners at centeral prison of Yasouj. The sample consist of 140 male who were selected according to the stratified sampling. These subjects answered the SCL 90 and resiliency (Friborg) questionnaires. For analysis of data, ANOVA, Tukey test and MANOVA were used. The results have shown that the rate of resilience in theft crime has been less significantly from murder, swindler and other crims. The results have shown that the rate of F in different crims is significant. So there is significant difference between resiliency among persons with different crims. Also the results have shown that there is not significant difference among different crims in mental disorders. Key words: resiliency, mental disorders, prison
INITIATING BEHAVIOR IN ROMANTIC RELATIONSHIPS: THE ROLE OF GENDER AND PERSONALITY IN PREFERING INITIATION STRATEGIES

A14. General issues and basic processes – Personality

ÖZge Ünal, Mersin University, Mersin - Turkey
Ayda Büyükşahin Sunal, Ankara University, Ankara - Turkey

INTRODUCTION: The expectations of individuals from their relationship partner are shaped at the onset of the relation. Hence the process of initiating a relationship should be investigated. AIMS: The aim of this study is to examine the personality traits of students who use different strategies of initiating a relationship. METHODS: The sample consisted of 303 Turkish university students, 187 of which were female. The subjects were evaluated with a Socio-demographic form developed by the investigators and The Big Five Inventory. In addition, the opinions about what should be done in the case of being interested in/liking a person from opposite sex were asked to the participants. Mann whitney u test was used in analyses. RESULTS: Some differences were found between the personality trait scores according to preferred initiation strategies for female and male initiators. The self-discipline levels of men and women who preferred direct initiation strategy for same-sex initiator were found to be greater than those who preferred indirect initiation strategy. DISCUSSION: According to our results the students whose self-discipline levels are greater than the others preferred direct initiation strategy for same-sex initiator. It may be argued that self-discipline is related to decisiveness and taking responsibility of their life which is involved in the process of initiating a relationship. CONCLUSION: Our results should be replicated with further studies on larger and more hetero-genous samples.
The aim of the study was to compare the temperament and behavior problems of toddlers born extremely preterm (EPT, gestational age <30 weeks) with toddlers born moderately preterm (MPT, gestational age ≥ 30 weeks). The participants comprised 109 toddlers between 18 and 36 months of age, divided into 56 EPT (gestational age mean = 28 weeks [±1.5]) and 52 MPT (gestational age mean = 32 weeks [±1]). The toddlers were attended at a multidisciplinary follow-up program in a tertiary university hospital. The mothers were interviewed using the Child Behavior Checklist for ages 11/2 – 5 years and the Early Childhood Behavior Questionnaire. The statistical descriptive analysis and the comparison between groups (independent t-test) were performed. The results showed that there was statistical significant difference between groups just on sadness temperament dimension of negative affect factor (EPT, mean = 2.9 [± 1.1] and MPT, mean = 3.5 [± 1]; p = 0.01). Otherwise, there were no statistical differences between groups on behavior outcomes. The total behavior problems mean scores were 58.21 in EPT and 60.65 in MPT. The majority of preterm toddlers presented a normal behavior profile (EPT = 46% and MPT = 54%). The findings showed that, independently of extreme or moderate prematurity, the toddlers born preterm attended in a follow-up program had similar positive temperament and behavioral profiles.
O576
TREND ANALYSIS OF WELLBEING OF UNIVERSITY STUDENTS IN FAST-ENTRY TO EMPLOYMENT CAREERS

B07. Development and education - Social cognition, identity and social interactions

Angélica Riveros-Rosas, National Autonomous University of Mexico, Mexico City - Mexico
Julieta Candelario-Mosco, National Autonomous University of Mexico, Mexico City - Mexico

Professions which offer the possibility of early employment, even before graduation, tend to be of high interest for behavioral researchers in countries like Mexico because students frequently come from a social and economic background which demand early job skills and opportunities. These students are usually the first members in their families to obtain a university degree. Earlier studies show that these students tend to show high rigidity and emotional distress, which in turn affect their interpersonal and academic performance.

Objective: To examine the emotional stability, social support, rigidity, resilience and study skills of three generations of students at UNAM’s School of Business Administration. Participants: A total of 7,700 students participated by responding to a battery provided to all newly enrolled students. Results: The main findings underlie key associations in their academic performance and such variables as parents schooling, quality of family interaction, rigidity and emotional distress. Discussion: The main findings assess generational trends in Mexico and their implications for students’ mental health.
This paper is a reflection on several years of work with children at risk in Mexico and Portugal; some final considerations about the role of Psychology in poor countries are made. Psychological development is a function of external and internal factors. Internal factors include a healthy body and external factors an environment with minimal well-being conditions, like good nutrition, a functioning family, a health system, school, relatively good living conditions and social peace. Variations in internal and/or external factors can produce a developmental deviation and then intellectual disability, learning disorders, ADHD, communication disorders, etc. Children growing in poverty can be victims of deviations, especially if they have disabilities. Intervention programs are urgently needed. The author applied behavioral procedures to train self-care, language, independence, social & academic skills to slum children with intellectual, physical or sensorial disabilities in Mexico. Similar procedures were applied to train children with school failure problems in slum-like communities and a small city in Portugal. Some results are presented in terms of behavioral goals attained by individual children in different training programs. Some cases of children with blindness, intellectual disability or school failure problems are briefly analyzed. Scholars teaching Psychology in poor countries are in a dilemma: attend to social problems or carry on research?
O581
TRANSGENERATIONAL THERAPY: CLINICAL INTEGRATION OF PSYCHogenealogy, TRANSACTIONal ANALYSIS and GESTALT PSYCHOTHERAPY

E19. Health and clinical intervention - Interventions

Immacolata Festa, Psychotherapist, Igat, Napoli - Italy

The family tree influences individuals’ lives: unresolved traumas and ‘unfinished business’, often emerge through unconscious ‘psychic material’, that drives descendants to re-act/re-live traumatic feelings and situations experienced by their ancestors. That can lead to uneases, illness, tragic deaths and accidents. By integrating three models, it is possible to develop a method in three steps to recover, re-read and re-narrate the patients from their own stories: (1) Psychogenealogy (1993, A.Schutzenberger, Abraham & Torock, Boszormenyi-Nagi): analysis and contact with the symptom/illness to encourage awareness of 'invisible loyalties', from debts/credits, from identifications-introjections-incorporations. (2) Transactional Analysis (1979, E.Berne): analysis and definition of the script’s structure and the script's directive; analysis of the parental model (demands/counter-injunctions), of the scene of conception, location and circumstances of birth, names, breastfeeding period and family parade. (3) Gestalt therapy (1951, F.Perls): repetitions’ disruption through cathartic acts, metaphorical and expressive techniques; processing of unfinished business and the creation of a ‘new memory’ in the hic et nunc; ‘restitution’ of family loyalty debts to ancestors and recapturing a sense of one's own identity. (4) This process makes it possible to dismantle the system for whom the individual represents his/her discomfort, to restore person's sense of individuality and his/her potentialities.
LABOR AND PRISON IN CONTEMPORARY CAPITALISM: THE EXPERIENCE OF A BRAZILIAN INDUSTRIAL PENITENTIARY

Lobelia da Silva Faceira, Federal University of the State of Rio de Jaineiro, Rio de Janeiro – Brazil

The qualitative research aims to analyze the process, relations and mediations of the labor of prisoners in the Penitenciária Industrial Esmeraldino Bandeira (SEAPEB), located at the Penitentiary Complex of Gericinó in the state of Rio de Janeiro (Brazil). The category work appears in the universe of prisons as an instrument of "resocialization", source of subsistence, possibility of time occupation and space in the hierarchy. This study is proposed to reconstruct the historicity of prison labor and its mediations in the process of constitution and reconstitution of the social lives of the prisoners, highlighting the material conditions given for the completion of this labor function. Working in prison provides the development of the working skills of the prisoners related to the needs of the labor market, granting them access to a proper remuneration, used to fund part of their expenses within the prison and also to contribute to the budget of their families. Besides that, the habit of working brings new perspectives and expectations for the prisoner, who happens to glimpse a new relationship with society. Historically, the concept of work in prisons is also related to the objective of minimizing the idleness of the prisoners and tensions of the prison routine, reinforcing the disciplining and controlling trait of the prison as total institution. The research object of study is to analyze the multiple sides and contradictions of labor in the Brazilian prison system.
NARRATIVES OF DISABILITY IN THE WORKPLACE: EXPLORING THE ‘UNSAYABLE’ USING LACANIAN PSYCHOANALYSIS

C08. Culture and society - Prejudice and social exclusion

Estelle Swart, Stellenbosch University, Cape Town - South Africa
Natalie Smith-Chandler, Stellenbosch University, Cape Town - South Africa

Human beings are regimentally conditioned to adhere to a set of socially-constructed norms. Those deemed as deviating from the prerequisites attached to these ‘conditions of normalcy’ have historically been marginalised and excluded. This has implications for the ‘disabled’ identity. A variety of theoretical models and policies have been instituted in an attempt to redress this discourse and to forge ‘new identities’ for individuals with disabilities. Yet, many continue to experience under- and unemployment as a result of lack of access to skills development; workplace discrimination and disabling environments. This exacerbates the psycho-emotional effects of internalized oppression. The purpose of the study was to explore the professional identity formation of 6 purposively selected individuals with disabilities employed in 3 mainstream labour contexts. We used an integrative narrative inquiry approach, drawing on Lacanian Psychoanalysis as a mechanism to analyze the ‘unsayable’ meanings hidden in the individual narratives of workplace experiences. In this paper, we focus on the narrative subtexts as alternative stories of disability viewed within a Lacanian Analytic framework. The ‘unsayable’ in the narratives revealed that individuals with disabilities continue to submit to psycho-emotional indicators at the level of the intrapsychic. Implications for future studies support that psychoanalysis can be successfully integrated to explore psychic states in disability research.
O586

PSYCHOLOGY WITH A GLOBAL IMPACT - USING NEW TECHNOLOGIES

F01. EXPO 2015 Hot Topics - Capacities building and human development

Niels Peter Rygaard, Private practitioner, Aarhus – Denmark

Online therapy, diagnosis and psycho-education offer amazing opportunities for psychologists. New technologies allow us to address major societal challenges on a global scale, influence policy and decision makers, and educate underprivileged audiences. Presenter gives inspiration and examples from attachment based training of orphanage and foster care systems worldwide. Research indicates that poor development for the millions of outplaced children is caused by the underprivileged status of caregivers and daily leaders. Governments lack capacities for managing children at risk. Presenter formed a network of researchers to design free online education and organizational development programs. In two EU Lifelong Learning projects 2008-12, programs were tested by child and government organizations in 12 countries, now open source in 14 EU language versions, reporting improved child development. Responding to Robert Roe’s 2011 EPC request, presenter founded an NGO in 2012 to reach developing countries. Programs are now implemented in 8000 Indonesia orphanages in cooperation with local NGOs and government. Also, by leaders of Estonian foster care and pedagogue organizations. Child psychiatry professor Kamikado Kazuhiro translated all programs into Japanese at Nagano University website; Chilean government and SOSChildren’s villages request trainer’s training. Fourteen developing countries translated and await online versions, including Vietnam, Thailand, Myanmar and China.

THE ADEQUACY OF A DISCURSIVE AND ARGUMENTATIVE APPROACH TO THE STUDY OF EMOTIONS IN DOCTOR-PATIENT INTERACTION

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Margherita Luciani, University of Lugano, Lugano - Switzerland
Silvia Pellegrini, Policlinico G. B. Rossi, Verona - Italy

In this paper we set out to explore the discursive and argumentative construction of doctors’ emotions in highly emotive oncological-communication settings, highlighting how the awareness of these emotions can be used as a tool in order to manage an optimal painful communication; given the complexity and multicomponentiality of the phenomenon “emotion”, for what concerns the theoretical framework, we followed three broad research trends pertaining to three distinct but intertwining disciplines, namely linguistics, argumentation and psychology. For what concerns the empirical part of the work, we collected a corpus consisting of 10 oncologic surgeon-patient interactions concerning the disclosure of the bad news of impossibility to surgically intervene in pancreatic cancer and of the necessity to do a chemotherapy, 10 interactions psychologist-patient, and 10 interactions psychologist-doctor about the impressions of the management of the painful communication. Results underlie that verbs and nouns are not interchangeable labels, but rather they permit to frame reality from a precise perspective; furthermore, results show that discourses used by doctors as well as arguments put forth in order to support a standpoint, open a peculiar path and can determine an appropriate management of the painful communication, in case that the doctor is aware of his own emotions. Moreover, results shed light on the importance of doctors’ awareness concerning the emotive impact that the painful communication can have on the patient. On the basis of this analysis, we suggest that research concerning bad news disclosure in psycho-oncology can benefit from an interdisciplinary approach, as that described in this paper.
The role of a parent is to nurture and provide care for their child; however research shows that factors such as parent mental health and child support needs can place some parents in a compromised situation with regard to continuing the parenting role within the family home for their child with a disability. The aim of this study was to profile parents caring for children with disabilities (PCwD) on several psychosocial variables related to why parents choose to seek out-of-home care (OHC) for their child. An online survey containing measures of various parent- and child-related psychosocial factors was completed by 261 PCwD. Cluster analysis uncovered four PCwD groups: vulnerable/stressed (high hassles, mental health and child support needs/behaviour, low competence, poor coping), strong/non-stressed (low hassles, mental health and support needs/behaviour, high competence, good coping), resilient (moderate hassles, support needs/behaviour and competence, low mental health, good coping) and uninvolved/inflexible (low hassles, support needs/behaviour and competence, high mental health, poor coping). This study shows that many variables related to OHC can meaningfully distinguish PCwD from one another. These profiles can inform efforts to promote family unity and minimise instances of parents choosing to place their child with a disability in OHC or, crisis situations where parents choose to relinquish care in the absence of a service plan to transition their child into OHC.

THE PROFESSIONAL TRAINING OF PRISON SERVERS

C11. Culture and society - Forensic psychology and law

José Paulo Souza, Federal University of the State of Rio de Janeiro, Rio de Janeiro - Brazil

This paper has proposed to systematize the Social Memory of the work and training of Inspectors and Security Penitentiary Administration (ISAP's) in the state of Rio de Janeiro process, providing analyzes and studies on the profile, training and work process of ISAP's the last four years and the constitution of School Management Penitentiary (EGP). The Center for the Study and Research of the School Prison Management (CEP) applies questionnaires periodically with the Inspectors of Prisons and Security Administration, seeking to provide a collection of materials for critical reflection and improvement of actions regarding the classes and prison practices. However, this empirical material is not analyzed in a methodical and scientific way, due to the lack of professionals and equipment. Soon, through a partnership with the Graduate Program in Social Memory at the Federal University of the State of Rio de Janeiro (UNIRIO), this research seeks to accomplish a scientific treatment of the data collected in the last five years and systematize a flow collection and analysis; ensuring a study on the process of training and qualifications for professionals working in the prison context.
O590
REFLECTIONS ON THE STATE CUSTODY/ARRESTED

C11. Culture and society - Forensic psychology and law

José Paulo Souza, Federal University of the State of Rio de Janeiro, Rio de Janeiro - Brazil

The article is proposed to analyze the role of implicit memory in the ideology of "resocialization" of people in prison institution of the State of Rio de Janeiro and subjected to the school rules and standards to transform them into docile people. This proposed "rehabilitation" and transformation presupposes some attempt to erase, once turn means leaving something aside at the expense of the new, that is, stop being such a "dangerous" person, by means of actions from the State to acquire new habits. The article was developed from a literature review, taking as some theoretical support linked to philosophy, psychology and memory; proposing perform reflections and questions, such as: The state can and can transform someone? As the state tries to turn the prisoner? The erasure of memories in fact is used in this process? Finally, try to identify this contradictory context of State / stuck in their practice, with the modern lines of understanding that State intervention in the person arrested.
The present study explores factors associated with involuntary memory recall that occurred after self-narratives in life-history interviews. Participants were 24 Japanese middle-aged and elderly adults. Self-narratives were promoted through life-history interviews, and involuntary memory recall was recorded in diaries for seven days after the interview. Some participants frequently recalled the same or similar events as those that had been narrated. In addition, the meanings and emotions that had been accompanied by some narrated events were altered and increased, respectively. By examining participant characteristics, factors associated with their memory recall, and the subsequent effects on meanings and emotions were revealed. First, life events such as bereavement or separation from a close relationship were associated with involuntary memory recall, as were conflicts about past life events. Finally, unfamiliarity with disclosure experiences such as self-narratives increased memory recall and the subsequent effects in participants. These results suggest that particular life events, conflicts about past life events, and unfamiliarity with self-narratives activate involuntary memory recall after self-narratives. In addition, these results indicate the responsiveness of middle-aged and elderly adults to the construction of life history.

THE PRINCE AND AUTOCRATIC PRINCESSES: EXAMINING LEADERSHIP EMERGENCE AND ENACTMENT IN YOUNG CHILDREN’S GROUPS

B07. Development and education - Social cognition, identity and social interactions
Romana Morda, Victoria University, Melbourne - Australia

There is limited research exploring leadership in young children’s groups. This presentation will examine the nature of leadership in preschool children’s groups and the characteristics and skills of emergent leaders. It will also explore how gender role expectations may inform the enactment of leadership by young boys and girls. Using a mixed methods approach this study specifically investigated the role that cognitive and social intelligence played in leader emergence and enactment in a sample of preschool children. A battery of tests was used to assess children’s general cognitive intelligence, social cognitive and social behavioural skills, and leadership play behaviours. An exploratory cluster analysis of play behaviors was undertaken in order to identify groups of children with similar play profiles. Three clusters were identified: Mixed play behavior style, Peripheral play behavior style and Leaders. This study’s findings suggested that both cognitive and social intelligence played a role in leader emergence and enactment. Case studies will be presented that illustrate how young leaders both conform to, and challenge gender role expectations. This study’s findings have implications for the development of preschool curriculum that encourages children to take on leadership roles whilst critically examining and challenging gendered scripts.
THE IMPLICATIONS OF AN EMPIRICAL STUDY OF THE CAREER SUCCESS OF BLACK SOUTH AFRICAN EMPLOYEES FOR THEIR CAREER MANAGEMENT

F01. EXPO 2015 Hot Topics - Capacities building and human development

Johan Malan, Stellenbosch University, Stellenbosch - South Africa
Shayne Roux, Stellenbosch University, Stellenbosch - South Africa

The current study utilised a mixed-methods exploratory research design to explore the most salient predictors of career success in a total sample of 668 black South African employees. The study consisted of a qualitative phase, followed by two quantitative phases. The qualitative phase and the first quantitative phase were utilised to evaluate the appropriateness of the instruments, as well as the qualities of the measurement model. The purpose of the final phase was to evaluate thirteen propositions guiding the study. During this phase, the psychometric properties of the instruments were confirmed, as well as the goodness-of-fit of the structural model. All of the paths in the final model were significant. The results of a step-wise multiple regression analysis revealed that job resources, psychological capital and supportive organisational climate were the most significant predictors of career success. The practical implications of the findings are discussed in terms of creating optimal conditions to psychologically empower employees to adopt the widely accepted trend of accepting personal responsibility for managing their careers. These optimal conditions include supportive leadership, supportive job resources, as well as interventions aimed at facilitating the development of psychological capital. The proposed interventions follow a convergent approach that acknowledges the interdependent nature of individual career development and organisational career management.
O614
PARENTING STYLE INFLUENCES SOCIALIZATION DURING EARLY ADOLESCENCE: THE MODERATING ROLE OF RESIDENTIAL MOBILITY

B09. Development and education - Adolescent adjustment

Ryosuke Asano, Hamamatsu University School of Medicine, Hamamatsu - Japan

Researchers have shown that parenting style (responsiveness and control) determines children’s socialization. The socioecological approach, however, argues that socialization cannot be fully understood unless the role of the socioecological environment, including residential mobility, is taken into account. This study investigated whether childhood residential moves moderate the association between parenting style and early adolescent antisocial (normative beliefs regarding aggression and cognitive distortions) and prosocial tendencies (empathic concern and perspective taking). A total of 720 junior high-school students (first-grade: n = 252, second-grade: n = 243, third-grade: n = 225) completed questionnaires. Regression analyses indicated that both responsive and controlling parenting styles were associated with lower levels of normative beliefs regarding aggression for non-movers, but not for movers. Both parental responsiveness and control were also associated with higher levels of empathic concern for non-movers, but not for movers. In contrast, these parenting styles were associated with decreased cognitive distortions and increased perspective taking, regardless of residential moves. The findings suggest that childhood residential moves may inhibit the impacts of parenting style on emotional socialization, i.e., normative beliefs regarding aggression and empathic concern, during early adolescence.
O615
STRESS SYMPTOMS AFTER SEPARATION: THE ROLE OF ATTACHMENT STYLES

B04. Development and education - Attachment and intimate relationships

Yağmur Yağmurcu, Uludağ University, Bursa – Turkey
Zeliha Bekçi, Yıldırım Beyazıt University, Ankara – Turkey
Ayda Büyükşahin Sunal, Ankara University, Ankara – Turkey

Attachment relationships continue throughout the lifespan that effect the romantic relationships and cognitive interpretation of stressful events. Attachment style is an important factor in coping with stress. The first aim of this study was to investigate whether stress symptoms that emergent after separation differs according to attachment styles. The second was to compare attachment styles with the subdimension of stress symptoms. 120 (75 females, 45 males) college students who had a separation in recent year participated in the study. To collect data, demographic information form, Experience In Close Relationships (EICR) and Stress Self-Assessment Checklist (SSAC) were used. Cluster analysis was applied to the Students’ scores that obtained from EICR. Group differences were tested by t-test and F statistics. Differences found between students with secure attachment and fearful attachment styles according to the scores that they got from the cognitive-affective subdimension and total score of stress symptoms. Males and females differed on stress symptoms. Gender did not predict college students’ attachment styles. Our findings showed that Turkish college students with fearful attachment style have stress symptoms more than the students with secure attachment style. These results show that attachment styles are important in coping with stress. Our results are consistent with the literature but confounding variables should be controlled with further studies.
INVESTIGATING THE SECONDARY TRANSFER EFFECTS OF INTERGROUP CONTACT USING MEDIATION AND MODERATED-MEDIATION MODELING

Georgios Filippou, University of Cyprus, Nicosia - Cyprus  
Charis Psaltis, University of Cyprus, Nicosia - Cyprus

The contact hypothesis has been described as one of the best ways to improve intergroup conflict. The purpose of this paper is to investigate the underlying mechanisms of the secondary transfer effects (STE) of contact i.e., the generalization of positive attitudes developed during contact to outgroups not directly involved in the encounter situation. We are exploring these structures using mediation and moderated mediation models. Specifically, we used data from 3 empirical studies, 2 cross-sectional and 1 experimental (N=3065, mean age: 30.4 years, SD: 7.6 years), to test attitude generalization as a potential mediator to STE, over and above contact with the secondary outgroup. Next, consistent with the latest discussion on STE, we used 5 variables that measure different types of intergroup distance to test for effects on the mediation models of attitude generalization (moderated mediation). The proposed variables are: Group Stereotype Distance, Cultural Distance, Social Distance, Group Social Status and Group Similarities. The operationalization we used for the moderators is novel to the intergroup relations literature. Results confirm the existence of STE and the role of attitude generalization as a reliable mediator to STE across the 3 studies. We also found evidence that intergroup distance is moderating the effects of attitude generalization across different conceptualizations of the moderator. The findings shade a new light to our understanding of how STE works.
Although there are currently many scales measuring ageism in the applied psychological literature, most of these have been focused on older adults and not on older workers per se. Of those few scales that do target older workers, the vast majority measure ageist attitudes and/or age discrimination, with little attention being paid to the content of age-based stereotypes themselves. Hence, drawing from the Stereotype Content Model and Terror Management Theory, we conducted a series of studies (total N = 1,981) to develop and validate a multidimensional measure of Work-related, Age-based Stereotypes (the WAS). Consistent with common sets of stereotypes regarding older workers found in both numerous quantitative and narrative reviews of the literature, the WAS includes both negatively (incompetence and inadaptability) and positively (warmth) valenced stereotypes of older workers. Two lab-based (Sample 1 N = 454; Sample 2 N = 709) and one field-based (Sample 3 N = 82) sample evidenced the three-factor model best fit the data, as compared to two valence-based factors and a unidimensional model. The scale evidenced good predictive, convergent and discriminant validity, in both lab and field samples. The three-dimensional model also partially mediated relations between job applicant age and hirability ratings. Moreover, a second field-based sample (Sample 4 N = 736) evidenced that the WAS dimensions predicted work outcomes beyond influences of worker age and job context. Keywords: Ageism, age-based stereotypes, ageist stereotypes, older workers, stereotypes, stereotype measurement
In this paper we present a scientific research carried out in order to evaluate the potential different effects on male and female subjects induced by a social spot about the gender discrimination. 60 students, 30 males and 30 females, were involved in the study in which neuroscientific techniques were applied aside traditional methods based on self questionnaires in order to understand in a deeper way consumer reactions to spot exposure. Eye-tracking and EEG technologies were synchronized and data were collected during the spot visualization. Quantitative analyses of emotional facial expressions computed by the software FaceReader were also used. Facial expression analyses, allow to identify less negative emotions in females in comparison to males. Combining the results from face reader and from eye-tracker technologies, it is possible to claim that male participants identified themselves with the males characters in the spot who were adopting negative social behaviors against women. Probably for this reason, males reported more negative emotional expressions. Also the EEG results showed a more important activation in male, supporting the idea that male subjects reacted with a stronger emotional activation in comparison to female. The aim of this work is to show how the integration of neuroscientific techniques can provide a wider range of information allowing a better understanding of subjects’ emotional reactions.
O621
THE MEDIATION EFFECT OF BURNOUT ON THE RELATIONSHIP BETWEEN STRESS AND PROFESSIONALISM AWARENESS OF SCHOOL COUNSELORS

D04. Work and organization - Well-being at work

Eunbi Chang, Korea University, Seoul - Korea, Republic Of
Sangmin Lee, Korea University, Seoul - Korea, Republic Of

School counselors play an important role in preventing maladaptive behaviors and maintaining psychological health for students. However, various sources cause stress for school counselors, such as financial problems, interpersonal relationships, and working environment. These stressors affect burnout and professionalism awareness. This research examined whether school counselor’s burnout mediates the relationship between three types of stress—financial stress, working environmental stress, and interpersonal stress—and professionalism awareness in sample of 282 school counselors in South Korea. To examine the role of burnout as mediator, mediation analysis using structural equation modeling was utilized. The results indicated that burnout fully mediated the relationship between working environmental stress and professionalism awareness. That is, the higher level of working environmental stress correlated with greater levels of burnout, and greater burnout level correlated with lower level of professionalism awareness. Meanwhile, burnout partially mediated the relationship between interpersonal stress and professionalism awareness. This indicated that higher interpersonal stress was related to higher burnout level, and higher level of burnout correlated with lower professionalism awareness. However, financial stress did not affect burnout or professionalism awareness. These results would be helpful to understand school counselors’ stress and prevent their burnout.
O622
A MULTI-GROUP LATENT GROWTH MODELING ON BURNOUT IN KOREAN MIDDLE SCHOOL STUDENT

B15. Development and education - Longitudinal analysis
Boyoung Kim, Korea University, Seoul - Korea, Republic Of

The purpose of this study was to examine the longitudinal relationship between effort-reward imbalance as a stressor and academic burnout as a strain. The study also examined the moderation effect of coping strategies in the relationship between effort-reward imbalance and academic burnout using multi-group latent growth modeling (LGM) analysis. The results indicated a significant relationship between the initial status of effort-reward imbalance and the initial status of academic burnout. Moreover, it indicated a significant relationship between the change rate of effort-reward imbalance and that of academic burnout. In addition, problem-focused coping strategies had a moderation effect on the relationship between effort-reward imbalance and academic burnout longitudinally. In case of students employing low problem-focused coping, the intercept of effort-reward imbalance contributes to the increase of academic burnout significantly. The present study has the following theoretical and practical implications. First, the results of this longitudinal study could promote understanding how much Korean students suffered by the imbalance between their efforts and rewards. Second, this result is consistent with early theoretical studies in that problem-focused coping is related with the alleviated levels of stressor and academic burnout. In order to prevent the development of academic burnout, counseling and academic guidance programs should be developed to support students.
Feedback strategies are frequently employed in government policy as a behavioural change strategy. The idea is that presenting people with information about their past behaviour can change their future intentions. Hence feedback strategies appear to rest on the assumption that “if only we knew better we would act differently”. In this paper we assess the validity of this assumption by examining whether feedback can influence pro-environmental intentions and the processes that it involves. Specifically, across 6 different studies we provided over 1000 participants with feedback about the yearly costs of their homes ‘energy vampires’ (i.e., appliances such as televisions and laptops that consume energy even when they are not being actively used). We presented feedback in several different ways (e.g., financial losses vs. financial savings, collective costs vs. personal household costs). Yet, regardless of the form in which we presented feedback it did not have a significant effect on behavioural intentions. However, feedback did significantly increase knowledge. Such findings are explained by the contribution of a variety of factors to pro-environmental intentions including pro-environmental attitudes, existing habits, appraisal of the feedback and perceptions of the potential monetary savings as "worthwhile". Accordingly, we present a model that accounts for the relationships between these factors and demonstrate that the model consistently fits our data.
Implicit determinants such as fleeting emotions and self-esteem are crucial in predicting snacking behavior. A smartphone application, Snackimpuls, was developed to gain insight into the implicit determinants of between-meal snacking in daily life. This study examines feasibility and reliability of Snackimpuls. Snackimpuls is based on the Experience Sampling Method (a validated structured self-assessment diary technique) and was used to collect multiple assessments (10 beeps a day for 7 consecutive days) of current emotions, self-esteem and between-meal snack intake. Emotions and self-esteem were assessed using a 7-point Likert scale. The sample comprised 8 women and 4 men from the general population, with a mean age of 43.6 years. Participants yielded 584 answered beeps, which is 69.5% of the maximum number of beeps. The mean score of positive affect (5.33; SD: 0.71), negative affect (1.23; SD: 0.28), agitation (2.13; SD: 0.69) and self-esteem (6.14; SD: 0.55) is consistent with previous studies. The reliability coefficients (Cronbach’s α between 0.79 and 0.94) are also in accordance with previous research. If respondents snacked, they consumed on average 172 Kcal per occasion. Snackimpuls was considered (very) user-friendly (82%). The results suggest feasibility and reliability of the Snackimpuls smartphone application. Snackimpuls is currently used in a large-scale study investigating implicit determinants of between-meal snacking in a general population sample.
O646
VIOLENCE TOWARDS WOMEN: AN INVESTIGATION IN TERMS OF AUTHORITARIANISM AND SYSTEM JUSTIFICATION

C08. Culture and society - Prejudice and social exclusion

Merve Cesur, Ankara University, Ankara - Turkey
Derya Hasta, Ankara University, Ankara - Turkey

Violence against women; without discrimination of religion, language, nation, class is one of the most common human rights issues in the world. This issue should be considered as a society’s perceptions about women rather than ordinary marriage problems. The aim of this study was to investigate the relationship between system justification, authoritarianism and demographic variables with “attitudes toward physical wife abuse” (APWA). The sample consisted of 151 (74 male and 77 female) Turkish participants. As measurement tools, Socio-demographic form, developed by the investigators, APWA Scale, Right-Wing Authoritarianism Scale and System Justification Scale were used. Pearson correlation and hierarchical regression analysis with t test for independent groups were conducted. APWA had a significant positive correlation with authoritarianism and system justification whereas had negative correlation with education and mother’s education level. Gender, the perception of exaggeration of violence against women, education and authoritarianism variables were found to be significant predictors of APWA. According to our results people who have lower education level with higher authoritarianism and system justification level tend to have positive attitudes toward violence against women. It may be argued that social psychological factors are strongly related with violence towards women. Our results should be replicated with further studies on larger and more heterogeneous samples.
In the last few decades the experiences of collaborative and web-mediated educational contexts are increasing (O'Donnell et al., 2013): learners are required to assume an active role in knowledge sharing and to promote Collaborative Knowledge Building (CKB, Scardamalia, Bereiter, 2006). To gain this aim the capacity to share the regulation of learning processes (Volet, Järvenoja, 2010) is a key determinant. In these contexts written texts represent the principal medium for learning. The aim of the work is to determine whether, within a CKB e-learning community, the promotion of shared regulation affects the performance in collaborative writing task. Using quantitative and qualitative methodologies, we compare collaborative writings of 275 students distributed in three conditions: no topics about shared regulation (SR); topics about SR spontaneously created by students; topics about SR created by the tutor. According to quantitative analyses (Boscolo, Borghetto, 2002), the results reveal that students produce more coherent texts if the tutor support them in sharing the regulation of the task. According to content analysis the students in the same condition write texts which are more responding to the task and more integrated. Our results show that the promotion of shared regulation can support metacognitive reflection on the features of the task and emphasize the importance of implementing a tool for shared regulation in web-mediated learning contexts.
Humans, as social Individuals, are influenced by social identification when they are facing the choice of cooperation. According to the Consistent Contributor (CC) effect, a CC can catalyze cooperation and cause other group members to increase contributions in voluntary contribution mechanisms. Weber and Murnighan (2008) proposed social norms to be the main cause of the CC effect. However, an alternative process could be that the CC presence significantly changes the members’ social identity thus influencing group members’ behaviors. Here we aim to establish whether the social identity or social norms can be used to explain consistent contributor effect. A public goods dilemma in the context of provision point mechanisms with “Removing consistent contributor” paradigm is used. According to the social identification theory, social identity is context-specific, which means CC removal will definitely influence the contribution level. However, once a norm has been internalized, people will keep following it unless a major change in circumstances occurs: therefore, the removal of the CC should not have salient impact on participants’ behaviors. Result supports the identity-based explanation: after the CC is removed, the contribution of participants in CC condition falls down dramatically and is marginally significantly (p<.01) lower than that in the control condition. We assume that loss aversion may explain this unexpected phenomenon.

COMPREHENSIVE SYSTEM OF COUNSELLING AND PREVENTION AND THEIR IMPACT IN THE SCHOOL (NATIONAL PROJECT ESF) - AN EXAMPLE OF THE GOOD PRACTICE TRANSFER OF PSYCHOLOGICAL RESEARCH INTO PRACTICE

B02. Development and education - School adjustment, academic achievement and learning disabilities

Alena Kopáňiová, Research Institute for Child Psychology and Pathopsychology, Bratislava - Slovakia
Eva Smíková, Research Institute for Child Psychology and Pathopsychology, Bratislava - Slovakia

The aim of the national project is to increase the education level of primary school pupils with special educational needs streamlining of educational counseling and prevention to ensure their social integration and in the labor market. Under this name hides the implementation of professional activities that directly affect the practical exercise of the professional activity of educational counseling and prevention in Slovakia. Research Institute of Child Psychology as the implementer of the national project is an institution that focuses on comprehensive research psychological aspects of development of children and youth and research conditions that affect this development. Connection between research institutions as the Contractor and practical counseling centers in the education sector as a target group will provide the transfer of research findings into routine practice experts. It happens by the way of innovation psychological and special-pedagogical methods, methodologies and their implementation into the counseling process and operational setting process standardization methodologies using electronic portal.
O664

ARCHITECTURE OF FAILED DECISIONS: ANALYSIS OF SUBOPTIMAL RESULTS IN MANAGEMENT DECISIONS DUE TO COGNITIVE BIASES

A13. General issues and basic processes - Thought, decision and action

Markus Domeier, University of Innsbruck, Innsbruck - Austria
Pierre Sachse, University of Innsbruck, Innsbruck – Austria

Based on the modes of decision-making (System 1 / System 2) by Kahneman (2003) and the individual decision process models by Jost (2001) and Kolkman et al. (2005), which describe the different stages of a decision, this study links cognitive biases in real economic managerial decisions to their stage of appearance in the decision-making process. The goal was a) to verify the occurrence and the external validity of decision biases in the context of everyday action, b) to localize these within the decision-making process model and c) to identify patterns of decision biases. Therefore, suboptimal strategic decisions were analyzed. Cognitive biases in management decisions were identified through an analysis of situational conditions that increase the likelihood of biases, the use of interventions to prevent them and the final output of the decision. Results show that cognitive biases can be identified in real decisions and can be linked to the specific process stages. Moreover, specific interactions of biases were observed. This allows the identification of critical stages in the decision-making process. This allows the development of a structural framework, which enables the identification of cognitive biases within decision-making processes at an early stage. Additionally the results build a basis for setting specific, adaptive interventions with the aim of reducing the likelihood of erroneous decisions due to biases.
The aim of the present study, is to examine factors leading to negative consequences such as posttraumatic stress disorder versus some positive changes such as posttraumatic growth in a representative sample of 740 adults from İzmir, Turkey. Turkey has been exposed to different types of traumatic events (disasters, wars, terrorism, violence, etc.) throughout the history. Because the focus of research has been relatively related to negative consequences, this gives way to focus on growth experiences in the way that in trying to cope with the traumatic events people may feel more strong, improve life quality, make meaning about self, interpersonal relations and the life. The community sample consisted of 64.3% of females, and 68.6% of the participants were married. The mean age of the participants was 43.20, and 14.1% of the sample reported a previous psychiatric problem. 31.5% of the participants were bothered by the exposed traumatic event, and 10.8% of the sample met all the DSM-IV criteria for the diagnosis of PTSD. In the current study, in order to examine the possible risk factors related to posttraumatic stress symptoms and the contributing factors leading to PTG, 3 main variables: coping strategies, perceived social support, and event-related rumination were analysed through regression analyses. The results and implications of the findings for clinical and research areas will be discussed.
O673
VALIDATION OF THE ATTITUDES TOWARDS SEX-AFFECTIVE DIVERSITY SCALE, RELATED VARIABLES & IMPLICATIONS FOR INTERVENTION

C04. Culture and society - LGBTQI studies

Helena Hernansaiz-Garrido, Facultad de Psicología, Universidad Autónoma de Madrid, Madrid - Spain
Manuel Martín-Fernández, Facultad de Psicología, Universidad Autónoma de Madrid, Madrid - Spain
Aida Castaño-Torrijos, Facultad de Psicología, Universidad Autónoma de Madrid, Madrid - Spain
Isabel Cuevas, Facultad de Psicología, Universidad Autónoma de Madrid, Madrid - Spain

The aim of the study is developing and analysing a Spanish scale for secondary school students to measure attitudes towards sex-affective diversity (gay, lesbian and bisexual people) to guide the intervention. These attitudes have been noted to be very important to peer relationships and homo/bisexual students’ self-esteem, yet there is no standardised scale available to measure them in the Spanish context. Based on previous work and literature, we developed a 33-item scale that was completed by 696 students from five secondary education schools in the area of Madrid, along with some socio-demographic data and other opinion questions. We kept 27 items and performed reliability (Cronbach’s alpha=.94) and construct validity (factor structure) analyses (one dimension was kept: CFI=.96, TLI=.96, RMSEA=.06 & SRMR=.05). We used the graded response model within the Item Response Theory to evaluate the items, which proved to be particularly discriminative for negative attitudes. Using a multiple linear regression by steps, we obtained that the 36.89% of the scale variance was explained by sex, perceived parents opinions, perceived peer opinions, direct contact with homo/bisexual people, interest in sexuality and perceived sexual education received at school. The implications are clear: there is a need of school programs for attitudinal change which include family and peers and provide contact with sexually diverse people.
O676
THE PROBLEM OF THE QUALITATIVE ASSESMENT OF CREATIVE INTELLIGENCE: A PILOT STUDY

C15. Culture and society - Qualitative methods

Andranik Suleymanyan, Moscow State University of Psychology and Education, Moscow - Russian Federation

The essence of this problem – how to assess the genuine creative intelligence, not the erudition, capacity to clear logic, cram for examination. Our theoretical foundation based on the ideas of intuition of H. Bergson, insight of W. Kohler and psychological types of scientists H. Selye. The aim of pilot study – to create and test the qualitative method of assessment, which includes three kind of non-standard tasks, selected from the folklore sources unfair forgotten and therefore rare used. There is four criteria the choice of tasks: heuristic, the real problem situation requiring decision, no necessity in special professional knowledge and multidisciplinary. There is three items for decision: two questions of Queen the Sheba to King Solomon and the trial between two women “who is the true mother of the child”? The sample of examinees – senior pupil in two schools: ordinary public school and for intellectually gifted children. The ability to define the essence of the problem, capacity to find the immediate practical solution and problem time were examined. The significant differences between two samples were noticed. Our and similar tasks may be used both for selection the persons capable for research work, invention and creating know-how and for diagnosis of the educational programmes for development of creativity. Direction for future researches – age and cultural modification, improving evaluation criteria and comparative cross-cultural investigations.
Both relevance and diffusion of technology within the schools is steadily increasing, but scarce attention is paid to the links between children’s active participation in designing technological products and the socio-emotional correlates. We conducted a 5-session intervention using the “GAmified CO-design with COoperative learning” (GaCoCo) method with 35 third and fourth-graders. It aimed at building the capacities to conceptualize, develop, and evaluate a game prototype through GaCoCo techniques. The game creation started reading a narrative and continued transferring narrative elements, e.g., characters. We measured the intensity of achievement emotions, as conceptualized by the control-value theory, and pre and post-intervention peer acceptance. Analyses of variance revealed higher intensity for positive compared to negative emotions and for females, but no differences between the intermediate GaCoCo session and a parallel traditional lesson. Intensity of negative emotions experienced in the first 3 sessions correlated negatively with post-intervention peer acceptance. Acknowledging limitations, we discuss the key role of knowledge co-construction and related psychological processes in building children’s developing abilities. Our findings can help in planning interventions focused on teaching computational thinking while taking into account children’s socio-emotional experiences, which previous research has shown to be important determinants of educational outcomes.
Social anxiety is one of the most prevalent adolescent disorders. Several factors especially, cognitive (hopelessness), and environmental factors (parental attitudes and peer rejection) are related to social anxiety. This study examined how these factors are related to social anxiety among high school students. Participants were 699 high school students with age ranged between 14 to 20 (M= 16.67, SD=1.09). Participants were administered Socio-Demographic Information Form, Liebowitz Social Anxiety Scale, Peer Rejection Scale, short-EMB-C (Egna Minen Betraffande Uppfostran) and Beck Hopelessness Scale. The result of independent samples t test revealed a significant gender difference [t (696) = 5.14, p <.001]. In other words, females had higher social anxiety as compared to males (Female M= 42.37; Male M= 34.12). Multiple regression analysis revealed that family income, number of sibling, hopelessness, mother rejection and peer rejection are significant predictors of social anxiety. Hopelessness may lead to negative cognitions about future this may result in perceiving more threat and maintaining the existing social anxiety. Due to rejective attitudes of their mothers these individuals may not develop social skills and peer rejection may be explained as a response of peers towards anxious behaviors of socially anxious students. The results of this study provided support the findings of literature from developing non-Western country.
O688
SPHERES OF INFLUENCE OF ATTACHMENT SCHEMA IN EVERYDAY LIFE

B04. Development and education - Attachment and intimate relationships

Marie Danet, University of Paris 8, Saint-Denis – France
Raphaële Miljkovitch, University of Paris 8, Saint-Denis – France
Emmanuel Sander, University of Paris 8, Saint-Denis – France

The purpose of this presentation is to expose recent findings of preliminary research on attachment’s generalization. Research suggests that attachment models influence friendships, romantic relationships and other relationships, beyond intimacy. The question remains as to the extent of their influence. Concordance between attachment representations of different relationships suggest a generalization of attachment patterns.

The present study explores generalization of attachment patterns in situations of everyday life, and the role of insecurity in excessive generalization and pervasiveness of attachment schemas. Attachment interview (Attachment Multiple Model Interview - AMMI) and interview on everyday behavior were administered to 89 participants (non-clinical, 65% women, m = 33.2 years old). Results show a partial generalization of attachment to father and everyday behavior. Results show also a link between attachment to mother and flexibility in everyday behavior. Attachment security to mother is correlated with more flexibility whereas attachment insecurity to mother is correlated with less flexibility. The link between insecure attachment and rigidity of behavior was suggested by theories on defensive exclusion, by research on the role of insecurity in psychopathologies’ development. However, our research is, to our knowledge, the first to demonstrate the influence of attachment on the flexibility of behavior in everyday situations.

ALBATROSS PROJECT: REHABILITATION FOR PSYCHOPHYSICAL DISABILITIES THROUGH THE SWIM SCHOOL

E12. Health and clinical intervention - Cognitive disturbances and rehabilitation

Manolo Cattari, A.S.D. Progetto AlbatroSS, Sport Club, Sassari - Italy
Giuseppe Manca, A.S.D. Progetto AlbatroSS, Sport Club, Sassari - Italy

AlbatroSS Project promotes in North Sardinia a psychomotor rehabilitation intervention in the swimming pool for people with disabilities. Psychologists, educators and swimming instructors collaborate to organize a rehabilitation path that uses cognitive-behavioural techniques and transactional analysis contributions (contract and alliance). The intervention is set out on three levels: 1. technical, swimming teaching; 2. psychological, family counseling; 3. supervision, for the swimming instructors in cognitive-behavioural therapy in water. The aim of the project is to promote the quality of life of disabled people and families. Through the learning of swimming there are improvements from the physical, psychological and social point of view. People have the opportunity to improve their own self-esteem, to build new and positive relationships and to increase their level of autonomy. The achieved results concern: the integration of disabled people in the swimming schools and the education to competition through the placement in competitive teams; An alliance with families of disabled people in the assumption of responsibility in the therapeutic path and at home, using the progress made in the swimming pool; The utilization of the swimming pool as a therapeutic setting and its integration in the socio-medical organization network in the territory. Up to date 150 families are followed in 4 different swimming pools, with a psychologist coordinating each facility.
O692

SELF-REGULATION IN RESPONSE TO ADVERSITY EMPHASIZE THE ROLE AND IMPORTANCE OF NEGATIVE EMOTIONS

A11. General issues and basic processes - Motivation and emotion

Karel Botha, North-West University, Potchefstroom - South Africa

This paper integrates and reports the results of 3 different studies in which hypothetical models of self-regulation in response to adversity were developed. Study 1 (n = 127) focused on self-regulation in response to relational conflict; study 2 (n = 77) on self-regulation in response to blocked life goals and study 3 (n = 25) on self-regulation in a poor rural community. All three studies applied Interactive Qualitative Analysis (IQA) to identify significant factors that play a role in the self-regulation of adversity, and second to develop conceptual models based on perceived relations between these factors. Although the three models differed substantially, one common theme emerged, namely the importance and value of negative emotions (within individuals and communities) during the initial phases of self-regulation. Findings support current approaches to negative emotions as important feedback processes in self-regulation, but also provide information regarding how negative emotions are dealt with in different contexts. The implications of these findings will be discussed while recommendations for further research will be made.
O694

ADOLESCENT DEVELOPMENT: A REVIEW OF STUDIES FROM 2004 TO 2013

B16. Development and education - Other

Rukiye Kızıltepe, Ege University, İzmir - Turkey
Elif Şeker, Ege University, İzmir - Turkey

The aim of this review is to capture the trend in adolescence issues by analyzing the studies published in the last decade. 919 articles from the Journal of Adolescence between the years 2004–2013 was reviewed. Analysis was classified according to the topics of the articles, stages of adolescent development, research methods used, country where the research was done, features of the sampling. As a result of the analysis based on the topics; it had been observed that some of the key issues of developmental psychology like attachment, identity development, parent-child relationship, effect of the peers on adolescents, risk-taking behaviors had been studied every year. With the effect of the developing technology and internet age; topics like usage of the internet, internet addiction, online harassment and the websites mostly used by adolescents as Facebook has also been investigated frequent. Additionally, while research in Asian countries covered suicide and self-harming behavior topics, other non North American countries studied crime and risky sexual behaviors topics mostly. When the journal is analyzed on the basis of sampling, middle adolescence through high school period had been examined most frequent. However, research made on pre-adolescence period has increased during last years.
O695
ENDOGENOUS AND EXOGENOUS ATTENTION IN ALZHEIMER TYPE DEMENTIA: EFFECT OF TARGET POSITION

E15. Health and clinical intervention - Aging and dementia

Funda Salman, Yezreel Valley College, Yezreel - Israel
Banu Cangöz, Hacettepe University, Ankara - Turkey

The main objective of the research was to investigate endogenous and exogenous attentional processes in terms of location in patients diagnosed with Alzheimer Type Dementia (ATD). The research was conducted with the 28 voluntary participants (14 females and 14 males) with the age range of 69-90 years. Endogenous and exogenous attention was measured by means of spatial cueing paradigm. According to repeated measures ANOVA results, participants gave longer reaction in terms of time and had lower reaction accuracy in invalid trials than they did in the valid and neutral ones in the whole conditions. Thereby, patients with ATD performed engagement, disengagement, and shifting operations of attention in invalid trials. However, in the condition of endogenous attention, they were unable to give fast reactions in the valid trials. Because of this, impairment in the ability of voluntary engagement to the target was observed in ATD patients. Also, target given from the left side of the screen led to late responses in the invalid trials. The obtained results were discussed within the context of lateralization and possible hemispheric dysfunction.
Mark Casson states that the entrepreneur is often identified as the founder of a firm or the owner-manager. The entrepreneur is self-employed and may employ others, but the entrepreneur is never an employee. Hereby, a paradox is created, since the Chief Executive Officers of large firms are salaried employees and therefore not entrepreneurs. The paradox is caused by reliance on an unsuitable definition of the entrepreneur (Casson, 2010, p. 249). However, Casson also finds that the CEO’s works “entrepreneurial” in their firms even they are not to be characterized as entrepreneurs due to their salary as employees. Moreover Casson argues that the misleading stereotypes of popular theories of the entrepreneur area weakness rather than a strength. On the other hand Casson argues that “a modern synthesis defines the entrepreneur as someone who specializes in taking judgemental decisions about the coordination of scarce resources (Casson, 1982)”, where the term ‘someone’ emphasizes the entrepreneur being an individual (Casson, 2010, p. 251). The entrepreneurial dilemma is conquered twofold in this paper. First by mapping the cross field of leadership and entrepreneurship in relation to personality with the objective to enlighten the specific factors supporting both the entrepreneur and the leader. Moreover, the common knowledge supports that there is an overlap between leadership and entrepreneurship in various subjects. Claudia C. Cogliser and Keith H. Brigham even consider the definition of an entrepreneur to have substantial overlap with that of a leader (Cogliser & Brigham, 2004). In general, the discussion about lack of agreement on definitions for the entrepreneurial leader is ongoing (Gupta, MacMillan, & Surie, 2004). With the purpose of finding theoretical arguments about the individual entrepreneur, a systematic literature review was conducted. Then, the keywords were chosen as the avenue for results because they become “talkative” with a razor-sharp shortcut to the essence of the articles. Only the keywords that have been mentioned more than twice have been withdrawn to simplify the result. Moreover, Gupta and colleagues state that the entrepreneurial leader encourages others to experiment and learn for themselves with an emphasis on discovery-driven approach to specifying problematic limits and mandating strategic commitment to new business development. By setting the climate through personal modeling of these behaviors “consistently, predictably, and relentlessly” entrepreneurial leaders ensure that others will emulate their behavior. According to Gupta and colleagues, the mechanism is not charisma, values, nor team pressure, but a collective spirit of conscious innovation (Gupta et al., 2004, p. 256).

IMPENDING JOB LOSS AND BEHAVIORAL HEALTH: THE AVONDALE SHIPYARD RESEARCH PROJECT

A05. General issues and basic processes - Genes-environment interplay and behaviour

Ronald Mancoske, Southern University at New Orleans, New Orleans - United States
Patricia Guillory, Southern University at New Orleans, New Orleans - United States

The presentation’s purpose is to share the results of a study that surveyed the impact of impending job loss on the health and mental health on workers in a shipyard with threatened closure. 7.2 The associated stressors of impending job loss include shifts in self-perception, challenges to coping skills, the loss of social interactions, and increases in anxiety and depression. The community is impacted when job loss is a reality not only because workers are no longer able to contribute to the community economically, but because they may require health and behavioral health services placing additional economic strain on the community. 7.3 Using the Behavioral Risk Factor Surveillance System and the Family Adaptive Scale with the subjects and a control group, the results indicated that the subjects experienced greater levels of anxiety and lower levels of social and emotional support, unrelated to family dissatisfaction, presumably accounted for by the threat of impending job loss. 7.4 The study revealed adverse effects of threats to job loss on the anxiety levels and social connectedness of workers. All community members are impacted by the strain on the community. Early planning and community engagement can positively impact public health and mental health on micro and macro levels. 7.5 Further study is needed with larger samples sizes representative of the communities facing employment loss. The findings need to be shared for the purposes of service provision and planning.
The purpose of this presentation is to expose recent findings of Internet use as a support for interaction by insecure people. One of the main motivations for Internet use is social communication. The new mode of interaction offered by Internet allows socially anxious people to be more comfortable and confident in interactions on the Internet compared with face-to-face interactions. People with insecure attachment experience anxiety in relationships. Online interactions, by reducing anxiety, could influence Internet use as a communication support by insecure. This research aims to better understand the link between attachment and Internet social use. Participants (non-clinical, N = 200) completed anonymous online self-report questionnaires: the Internet Motives Questionnaire, which measures reasons of Internet use and the Relationship Scale Questionnaire, which assesses adult attachment. Results show a link between: 1) insecure attachment and Internet use to communicate more securely; 2) insecure attachment and Internet use to stay connected with one another. The association between insecure attachment and Internet use to stay connected was mediated by Internet use to communicate more securely. Insecure people have poorer social skills than secure one. They seem to use Internet to overcome social difficulties due to the safety environment provided by Internet. Because of their specific characteristics, online interactions could be perceived as less risky by insecure people.
O706
THE TEAM CONFLICT IS A NEGATIVE FACTOR FOR THE TEAM PERFORMANCE? A STUDY ON 40 HEALTH CARE DEPARTMENTS OF SIX PUBLIC HOSPITAL

Guido Sarchielli, Alma Mater Studiorum - University of Bologna, Bologna - Italy

The Italian Health Services are structured into “Departments” which are semiautonomous hospital divisional units, in which several clinical wards are integrated or merged. The Department Committee (DC) represents the decision-making body of the department, which ensures the participation of Chiefs of Clinical Units at the definition of the Department’s organizational-managerial asset. Some recent empirical studies have found that team conflict (relationship, task and process conflict) can improve team performance. In the current study, realized in the medical managerial context, we focus on the relationship between conflict and group performance (evaluated through the Comparative Performance Index -CPI- as indicators of Clinical Units efficiency). If the "Team conflict" increases, also the CPI indicator improves: in fact, there are negative associations between process conflict ($r=-.215, p<.01$); relational conflict ($r=-.243, p<.01$) and task conflict ($r=-.211, p<.01$). The results support the hypothesis, already sustained by a part of the literature, that, also in the medical context, the team conflict can lead to a sharing of viewpoints and increased discussions, which improve the team performance. The DC represents the main context in which the quality, safety and efficiency of the care processes can be pursued. The results sustain the importance of the DC’s functioning for the Clinical Units' efficiency.
RIEMERGERE: A PROJECT AGAINST YOUTH MALAISE. FORMING LIFEGUARDS THROUGH SELF DETERMINATION

Manolo Cattari, A.S.D. Progetto AlbatroSS, Sport Club, Sassari - Italy
Giuseppe Manca, A.S.D. Progetto AlbatroSS, Sport Club, Sassari - Italy

Riemergere (Resurfacing) is a psycho-pedagogic project designed in Sardinia by Progetto AlbatroSS to train as Lifeguards young people, sent by the juvenile court of Sassari, suffering socio-economic difficulties and with legal proceedings. The theoretical construct on which this intervention is based is the Franklian therapy whose objective is to teach to young people in trouble and with low responsibility towards themselves to take care of others. The intervention is set out on 4 processes. Initially, the recipients flank swimming trainers for people with disability in Progetto AlbatroSS activities. Then, they attend an introductory swimming course in order to strengthen the sense of self-determination theorized by Franklin. Once they acquire the swimming basics, the guys start a federal course to become lifeguards. Finally, the intervention foresees a seminar of 4 training meetings with a psychologist that stimulates the learning through the cooperative learning strategy. It is an integrated project that is able to involve associations of the tertiary sector coming from the sport sector, social work, locals municipalities, local health authority and juvenile court. The aims of the project are the placement of young people in the work environment and the protection of the Sardinian sea. Up to date 12 federal lifeguards have been trained, of whom 4 have become swimming instructors for disabled children at the AlbatroSS in a real virtuous circle.
O712
VALORIZATION OF OCB AND ORGANIZATIONAL MANAGEMENT STYLE

D05. Work and organization - Organizational behaviour
Anne-Marie Vonthron, Paris Ouest University, Paris-Nanterre - France
Emilie Vayre, Paris Ouest University, Paris-Nanterre - France

Organizational Citizenship Behaviors are not formally prescribed and rewarded in organizations yet they lead to a positive socio-organizational valorization. However, the OCB would be valued differently depending on the source (colleagues or superiors) of judgment (Turnispeed & Rassuli, 2005) and according to their orientation (OCB-O or OCB-I) directly serving the organization or on the interactions between the co-workers (Podsakoff et al., 2000). We hypothesize that their valorization in the workplace depends on organizational management style (authoritarian vs participative) because the managerial context encourages more or less pro-social behavior. A total of 362 employees completed a questionnaire containing a measure of management style within their organization (LOP scale, Likert, 1974) and items related to perceived valorization (positive/neutral/negative) of OCB-I (12 items about altruism and assistance to co-workers) and OCB-O (10 items about sportmanship and loyalty) from a source of judgment (superiors for 194 participants; colleagues for 168 participants). The results show that the managerial style significantly explains the positive perceived value of OCB-I for the two sources of judgment (supervisors: R² = .138; colleagues R² = .104). Regarding the value assigned to OCB-O, the results are mixed depending on the source of judgment. These results will be discussed in terms of the theory of social exchange and organizational choices for OCB promotion.
O714
FACE ENCODING UNDER THE INFLUENCE OF REPETITION AND ATTENTION ORIENTATION: EVENT-RELATED POTENTIAL EVIDENCE

A09. General issues and basic processes - Learning and memory

Sam C. C. Chan, The Hong Kong Polytechnic University, Hong Kong - Hong Kong
Tommy L. H. Lam, The Hong Kong Polytechnic University, Hong Kong - Hong Kong
Chetwyn C. H. Chan, The Hong Kong Polytechnic University, Hong Kong - Hong Kong

Repetitive viewing of faces in spaced manner is shown to facilitate subsequent face recognition. Increased negativity of an event-related potential N250 and positivity of P600 are found to be associated with face familiarity and face recognition, respectively. Yet, the interaction of repetition effect and orienting attention to correctly associated facial information is not well addressed. It was hypothesized that, apart from repetition, constant attention on relevant information across repetition would also be associated with successful face recognition. In this study, cognitively intact participants were asked to learn 120 novel faces for 4 times under spaced repetition followed by face recognition. Repeated ANOVA unexpectedly revealed significant reduced negativity in N250 amplitude in hit trials with recall-laterality interaction effect in the second face viewing. Besides, larger P600 amplitude was also found in the second repetition of face viewing. The increased P600 confirmed subsequent memory effect. Decrease in N250 in hit trials may reflect orienting attention to relevant facial features for encoding. On the other hand, increased N250 amplitude may suggest reduced attention to facial details for subsequent face recognition. This study results implied that orienting attention to relevant information of faces facilitates face encoding. This would direct cognitive strategy to enhance face recognition.
O717
ASSOCIATION ABILITIES AND INHIBITION SKILLS DIFFERENTIALLY PREDICT CREATIVITY AND SCHIZOTYPY. AN EEG STUDY

A12. General issues and basic processes - Intelligence and cognitive functioning

Christian Rominger, University of Graz, Graz – Austria
Andreas Fink, University of Graz, Graz - Austria
Elisabeth M. Weiss, University of Graz, Graz - Austria
Günter Schulter, University of Graz, Graz - Austria
Ilona Papousek, University of Graz, Graz - Austria

Positive correlations between creativity and schizotypy are frequently reported. The aim of the present study was to find features that both traits share and features that differentiate both traits. The current scientific view suggests that the propensity to produce remote associations may be fundamental to creative ideas as well as positive schizotypy. The ability to inhibit prepotent reactions at a very moment may be positively related to creativity and negatively related to schizotypy. From a pool screened for positive schizotypy, 55 participants (26 men) were selected. Association and inhibition tests were administered while the EEG was recorded. As predicted, creativity was positively and schizotypy was negatively correlated with inhibition performance in a dichotic listening task (DL). The propensity to associate was positively correlated with both traits. In line with the behavioural results, a higher event-related desynchronisation of the lower alpha band was found for participants with low positive schizotypy during the DL in frontal brain regions. The decreased inhibition performance of high schizotypal participants in the DL may be due to a reduced task-related activation in frontal areas. Given a propensity for remote associations, excellent inhibition skills may be vital for creative performance. However, reduced inhibition control may lead to positive schizotypy. Therefore, the findings support the idea of enhancing creativity by executive functions training.
O718
INTERDISCIPLINARY HIV PREVENTION IN WOMEN

E08. Health and clinical intervention - Community psychological cares

Alla Shaboltsas, Saint Petersburg State University, Saint Petersburg - Russian Federation
Tatiana Balachova, Oklahoma City University, Oklahoma - United States
Julia Batluk, Saint Petersburg State University, Saint Petersburg - Russian Federation
Mark Chaffin, Oklahoma City University, Oklahoma - United States

The purpose of this presentation is to discuss key findings from studies on HIV prevention among women. Although women in the general population are not at the highest risk of contracting HIV, there are at-risk groups that are susceptible due to high-risk behaviors. Increasing new HIV infections are transmitted sexually in women in Russia. Culture and gender-specific aspects of transmission need to be explored. The main objective of studies that are conducted by the St. Petersburg State University-University of Oklahoma international research collaboration is to understand the complex factors that affect HIV risk and utilization of HIV prevention strategies for women to design a prevention program for this population. The studies utilize the ecological model framework. Results of a pilot studies identify the major psychological and behavioral factors influencing HIV risk in women, including risky drinking, having at-risk sexual partners, multiple partners, and lack of condom use. Findings suggest limited HIV knowledge, stigma, and fear of retaliation associated with HIV testing or diagnosis. A pilot study indicates that HIV testing behavior may be relatively easy to modify as a prevention strategy in Russian women. Reducing HIV transmission in women reduces the risk in children. Greater priority should be placed on social research to inform the development of prevention including community-level interventions, and prevention approaches for at-risk population groups.
“WALK THE TALK’’: PRACTICING THE ETHICAL CODE OF PRACTICE

Silvia Apollonio, Catholic University of Milan, Milan - Italy
Silvia Ivaldi, Catholic University of Milan, Milan - Italy
Giuseppe Scaratti, Catholic University of Milan, Milan - Italy
Vincenzo Saturni, AVIS, Milan - Italy

This contribution analyses the criticalities related to ethical values inside organizations. It describes how the organizational players, coping with ethical problems, become able to engender transformative agency and promote organizational change, thanks to the creation of specific socio material conditions. The paper explores CHAT (Cultural Historical Activity Theory) in the analysis of dialectical contradictions and their management in an organization in which ethics is one of the most important aspects. Specifically, the paper describes an intervention-research in the biggest Italian voluntary blood donors association (AVIS) that involved the organizational players from all the local sites in Italy. The underlying hypothesis is that the development of a globally recognized ethical culture can help the association’s stakeholders in reducing difficulties related to ethical issues. It also increases their sense of belonging and improves the quality of the services delivered to the final users of the donated blood. The paper points out the research approach adopted to identify critical problems and detect socially recognized ethical principles (that led to the creation of an ethical code of practice) and the methodology used to plan actions for change and spread operational practices. The conclusions highlight the institutional and organizational implications related to the challenge of improving ethical culture and its translation into the practice of daily experience.
Many previous studies had revealed Bipolar Disorder-Anxiety disorder togetherness is observed fairly often, and the additional anxiety diagnosis negatively affect the disease severity and process in Bipolar Disorder patients. Art Therapy is a form of psychotherapy that has been practised for over 60 years. It has been promoted as a means of helping people who may find it difficult to express themselves verbally engage in psychological treatment. The art of marbling, which was frequently used during the Seljuk and Ottoman era, reached Europe during the beginning of the XVII. Century, under the name of Turkish Paper. Marbling, which we describe as the music of the colors, has a soul-soothing harmony. Ebru, firstly teaches and develops being patient. As an Ebru artist is not always fully in control, particularly people with obsessions learn to accept what exists. It is a fact which is proven by experience that Ebru has a therapeutic feature, contributes to improving the aesthetic sensitivity, communication, using the time correctly, motivation, creativity, patience, discipline, adaptation, and gives positive results in coping with certain problems such as stress, instability and anxieties. In the present study, it is aimed to research the effect of the art-therapy activity with marbling, on illness symptoms and anxiety levels in patients with bipolar disorder. When the previous studies in the relevant field are examined, it was seen that while there are few studies in which art-involving therapy is applied on schizophrenic and bipolar patients, there are no previous studies in which the effectiveness of art-therapy activity particularly involving marbling was measured. 35 patients diagnosed as schizophrenic according to DSM-IV TR and 35 patients diagnosed as bipolar disorder patients, followed in a University hospital, the psychiatry service of a State Hospital and the Psychiatry Polyclinic of the same State Hospital, were included to the study. The study consists of the control group and the patient group. It was ensured for the control group, actively treatment receiving patient group and ambulatory patient group to carry out marbling practices in a special room allocated for the practice, for 30 minutes 3 days a week and for a period of 8 weeks. Before and after the effort (preliminary test – final test) Positive and Negative Syndrome Scale (PANSS), Beck anxiety inventory (BAI) were applied to the patient group diagnosed as schizophrenic; while Beck Anxiety Inventory (BAI) was applied to the patient group diagnosed as bipolar disorder patients, and to the control group. In the preliminary and final test comparison of scales applied to schizophrenia patient group, PANNS negative symptoms, PANSS positive symptoms and PANNS general psychopathology points, along with BAE points were found as significantly low, following the application. It is stated, previous art therapy activities conducted with psychiatry patients, were effective in the elimination of negative and patient symptoms in schizophrenia patients, like it is the case in the present study. In the comparison of the scales applied to schizophrenia patient group as preliminary and final tests, PANNS negative symptoms (<0.001), PANNS positive symptoms (<0.001) and PANNS general psychopathology points (<0.001), along with BAÖ points (p<0.05), were found as significantly low, following the application.
O725
PROMOTION OF SECURE RELATIONSHIP BETWEEN PARENTS AND CHILDREN THROUGH THE SAFETY IN THE WATER

B04. Development and education - Attachment and intimate relationships

Manolo Cattari, A.S.D. Progetto Albatross, Sport Club, Sassari - Italy
Giuseppe Manca, A.S.D. Progetto Albatross, Sport Club, Sassari – Italy

The Baby Swimming Course Project designed by Progetto Albatross of Sassari was born as an actual application of the Bowlby’s attachment theories and the circle of security theory. The intervention aim is to teach basic swimming techniques to parents and children from 3 months to 3 years old. Parents and children do together the activities in the swimming pool 2 times a week and they are part of a group. Each year there are parents and children sent by the Anti-Violence Centre of Sassari are involved in the project. The project aim is to build a safe relationship in water and to work on the physical relationship, that links parents and children in this moment of life. On one hand it is trained the neonatal familiarity with water, with the help of a swimming instructor; on the other hand a psychologist takes care of the parent-child relationship with particular attention to the attachment-exploration dynamic. The intervention foresees 3 activities: the first one regards the work in water with the swimming trainer, the second consists in a group consultations about parenting by a psychologist, the third consists of drawing up a small manual on child development that is distributed to the parents.
EMOTIONAL SECURITY AND PSYCHOLOGICAL DISTRESS AMONG SURVIVORS OF CHILD SEXUAL ABUSE

According to the emotional security theory (EST), conflicts between parents can lead to emotional insecurity in their children, who are trying to regulate their exposure to conflicts in a maladjusted way and developing insecure representations of the relationship between their parents, resulting in a higher probability of their developing psychological difficulties. Also, according to the specific-linkage hypothesis, the symptomatology developed may depend on the specific pattern of emotional insecurity shown by the children. The EST identifies 3 patterns of child security in community samples: secure, preoccupied, and disengagement strategies. The aim of the present study was to examine the role of emotional security in the family system on the psychological distress of victims of child sexual abuse (CSA), analysing the differential effects of different patterns of emotional insecurity. The sample comprised 147 young adult female survivors of CSA. Emotional security was assessed with the Security in the Family System (SIFS) Scale and psychological distress with the Symptom Checklist-90-Revised (SCL-90-R). Results showed that the preoccupied strategy was related to every SCL-90-R subscale except interpersonal sensitivity and hostility, which were the only subscales related to the disengagement strategy. No relationship was found between the secure strategy and SCL-90-R scores. This study confirms the hypothesis that the emotional insecurity of CSA survivors is related to their psychological adjustment, thus confirming the specific-linkage hypothesis in this population.
O729
SEXUALITY OF CHILD AND SEXUAL ABUSE SURVIVORS

B13. Development and education - Child abuse and neglect

David Canton-Cortes, University of Málaga, Málaga - Spain
Maria Rosario Cortes, University of Granada, Granada - Spain
Jose Canton, University of Granada, Granada - Spain

The aim of this research was to analyse the possible differences in sexuality among female survivors of sexual abuse during childhood or adolescence and non-survivors of the same age, family structure and parental educational level. In order to assess sexual desire, sexual arousal, orgasmic ability, and negative sexual affect, the “Brief Sexual Functioning Questionnaire” (BSFQ; Meston, Rellini & Heiman 2006) was employed. An additional question was used to assess anxiety, fear, and disgust associated with sex. In addition, sexual intimacy was assessed through Jacob and Veach’s (2005) interview (“Are you satisfied with sexual intimacy?” “Does it feel natural and comfortable?” “How frequently are you sexually intimate and who usually initiates sexual intimacy?”; “Being sexually abused may lead to confusion about their sexual identity. Has this been an issue for you?”). The sample comprised 112 female college students aged between 18 and 24 years who had suffered sexual abuse with physical contact. Students’ t-test results showed that mean scores of survivors were significantly higher on the 4 sexual desire measures (sexual desire or interest during the past month; sexual thoughts, fantasies or erotic dreams; masturbation). However, survivors also presented higher mean scores on fear during a sexual interaction and anxiety or disgust. In addition, the results of Chi-square analyses showed that the percentage of sexual abuse survivors who experienced confusion about their sexual identity was significantly higher than that in the comparison group.
O730
LIVING IN A BUBBLE: AN EMPIRICAL STUDY ON AMERICAN WOMEN IN ISTANBUL

C03. Culture and society - Sex and gender

Neslihan Sabuncu, Ozyegin University, English, Istanbul – Turkey

Drawing from social identity and feminist theories, the current study examines experiences of American expatriate women in Istanbul, via a gendered and cross-cultural lens. The research was conducted using standardized interviews with a sample of 32 American expatriate women in Istanbul, who had lived there ranging from a few months to several decades. Grounded Theory was applied to analyze the gathered data. The American women’s journey starts from their “Promised Land” to a faraway destination, Istanbul, which carries both Oriental and Occidental features. Results yield “otherness” as the central concept with the extent to which a new social identity is (or is not) accepted by either self or others. Participants’ identity conflicts were driven by both with external (e.g. transitioning to a culture with much stronger gender stereotypes) and internal factors (e.g. being “the other” vs. “one of us”). Engaging with this host culture or disengaging from it was a personal choice, but insufficient for acceptance by the Turkish majority. This study explicates who the “other” from a Turkish and also an American perspective is. Therefore, the “I” in Istanbul is seen to clash with how Turks see the “she” in Istanbul. As a result of conflict, participants set their own boundaries of life and identity. Results extend research on expatriate identity via a gendered perspective, and particularly on how the confluence of culture and gender shapes identity conflict.
O735
PERSONALITY AS A MARKER OF INDIVIDUAL DIFFERENCES IN EMPATHY

A14. General issues and basic processes – Personality

Brian Haas, University of Georgia, Athens - United States

Understanding the emotional states of other people strengthens many social relationships. By understanding the emotional states of others, people are better positioned to empathize and help others. Within the human population, there exists considerable variability in the ability to understand the emotional states of other people as well as the tendency to be empathic. However, the factors associated with individual differences in emotion recognition and empathic processing are currently not well understood. This body of research was designed to use a personality model to characterize individual differences in empathic processing, behaviorally and within the brain. We collected personality, functional neuroimaging (fMRI) and behavioral data from a sample of healthy participants. We found converging evidence that the personality traits extraversion and agreeableness are associated with the ability to understand the emotional states of other people. Additionally, we found that both extraversion and agreeableness are associated with localized patterns of activity within brain regions involved in theory of mind and mentalizing (temporoparietal junction and medial prefrontal cortex) when making efforts to understand the emotional states of other people. These findings elucidate the way personality reflects the way people empathize with others and strengthens the utility of the Big 5 model of personality as a tool to characterize individual differences in social cognition.
Aim of the study was to develop a compound personality scale to improve criterion-related validity in predicting task performance. Literature indicates that using facet-level constructs yields higher validities than factor-level constructs in the prediction of criteria. In this study, the compound personality scale was developed by including Five Factor Model (FFM) facets that were deemed relevant to task performance-related behaviors. It was hypothesized that including criterion-specific facets would improve predictive power as compared to using the broad constructs. Based on the literature, self-discipline, achievement striving, deliberation, compliance, openness to ideas and actions, assertiveness, activity, excitement seeking, trust, and compliance were the FFM facets associated most with task performance. Corresponding International Personality Item Pool facets were gathered to yield 650 items. After an item elimination procedure based on predetermined criteria, 150 items were subjected to Classical Test and Item Response Theory analyses in a sample of 423 students, leaving 88 items. In a sample of Teaching Assistants, the compound scale correlated significantly with task performance as rated by faculties that worked with the TAs (uncorrected $r = .36$, $p < .01$) and explained 7% of incremental variance over a composite of BFI broad factors. The study contributes to the literature in terms of using facet-level compounds and offers a readily available scale based on the IPIP.
O738
HOW THOSE WITH OC SYMPTOMS EXPERIENCE INTIMATE RELATIONSHIP IN REGARD WITH THEIR EARLY MALADAPTIVE SCHEMAS AND ATTACHMENT STYLES: A GROUNDED THEORY STUDY

A16. General issues and basic processes – Other

Azadeh Attari, Ferdowsi University of Mashhad, Mashhad - Iran
Zohreh Khosravi, Alzahra University, Tehran - Iran

Research findings show that individuals with OCD have serious problems in their intimate relationships. The aim of this paper is to study how early maladaptive schemas and attachment styles affect intimate relationship experience in patients with OC symptoms using applied phenomenological approach and grounded theory methodology. Participants include 10 men and 10 single women diagnosed with OCD (mean age = 28 years old). Data were collected through in depth interviews. Date analysis, using open coding, axial coding and selective coding reveal that early maladaptive schemas reproduce each other in 4 different levels with regard to one's attachment style. At the first level, there is emotion depravation schema which determines one's attachment style and his coping style with second level conditional schemas such as shame/defectiveness, social isolation, abandonment/instability and mistrust/abuse. These schemas cause one to produce third level schemas, like sacrifice/subjugation, through developing approval seeking and enmeshment/undeveloped self schemas. In addition, emotion inhibition as the only schema at fourth level is produced by all the schemas in three previous levels. In addition, unrelenting standards are caused by either entitlement/grandiosity or mistrust/abuse schemas. Our findings have some implications for clinical therapists to decide which schemas should be treated at first with regard to one's attachment style and conditional early maladaptive schemas.
PILOT STUDY ON PSYCHOLOGICAL NEEDS AT COMMUNITY-BASED CARE FACILITIES - BASIC DATA FOR PSYCHOLOGICAL TRAINING –

Kyoko Hori, Seigakuin University, Ageo - Japan

In Japan, socialization of care for the elderly is being implemented in the year of 2000, then “community-based services” were institutionalized to provide care like living in their familiar community. The use of community-based services is increasing, but some issues particularly for psychological understanding of nursing situations have been reported. Despite the knowledge psychological support is urgently needed to improve the quality and mental health of care facilities, little schooling or training has been examined for this purpose. Thus, this study explored psychological needs to provide effective training for care staff. Staff responded to the questionnaire that inquired about their current job. Factor analysis extracted two factors: a sense of fulfillment and cognition of distress. Correspondent analysis was done based on fulfillment and distress: high fulfillment (ffm)/high distress, high ffm /low distress, low ffm/high distress, and low ffm/low distress. It showed that low ffm/high distress for men was found, high ffm/ moderate distress for women, high ffm/high distress for the managers/leaders, and moderate ffm and distress for the care staff. By age, there was moderate ffm/low distress for those in their 60s, while moderate ffm and distress for those in their 50s, 30s and 20s, and high ffm and distress for those in their 40s. These results can be utilized as a basis on which to plan efficient training programs.
O746
INTERACTION BETWEEN THE CHILD, THE FAMILY AND CHRONIC ILLNESS

C02. Culture and society - Family systems and processes

Kékes-Szabó Marietta, University of Szeged, Szeged – Hungary

Somatization means physical symptoms without physical pathology by individuals, which have some kind of an emotional or communicative role in the patients’ life. Older textbooks of child psychiatry defined asthma bronchiale (AB) as a psychosomatic disorder, which term referred to the significance of psychological factors in the development of the disease. In this way, symptoms are in close relation with the person’s individual properties and the functioning of his/her family (Weisblatt, Hindley, & Rask, 2011). The aim of my study was to learn more about AB-patients’ cognitive processes and family structures that contribute to the development and maintenance of symptoms. I used the Stroop Test (Stroop, 1929, 1935) (to measure cognitive flexibility) and Gehring’s (2010) Family System Test (FAST) (to explore family representations) in my study. 15 young adults with AB and 15 with a healthy status were involved in my research. The results confirmed more rigid cognitive processes and family representations by patients with AB. The latter results on the one hand may be the manifestation of the more rigid cognition, but on the other hand it may also be the realistic mirror image of the given family organization. The delimitation of these phenomena and the exploration of their relationship need further studies.
According to the CASA (Computer Are Social Actors) paradigm, individuals apply social cognitive constructs and stereotypes to computers and new media. We investigated whether the CASA paradigm could be applied also to other more basic technological devices (e.g. household electrical appliances, which are becoming increasingly more technologically sophisticated). We hypothesized that humans apply gender-science stereotype to such devices, so that the technological ones would be associated to male and the less technological ones to female. To test this hypothesis, we employed the Implicit Attitude Test (IAT) paradigm. A preliminary IAT tested the presence of gender stereotype in our sample. Then, in a first IAT, participants (n=80) were asked to associate two target concepts (i.e. pictures of traditional washing machines and computers) with an attribute indicating a male or a female: results showed a stronger association of washing machine with female and of computer with male. In a second IAT target concepts were represented by pictures of (a) highly technological washing machines and (b) computers with features typically attributed to female-style. Contrary to previous IAT, results showed a stronger association of washing machines with male and of computers with female. The results are discussed in light of possible effects of this implicit gender stereotype on apparent usability and customer satisfaction.
THE EFFECT ON LEARNING OF THE INTRODUCTION OF ONLINE TRAINING: A CASE IN THE TEACHING OF PSYCHOLOGICAL ASSESSMENT

B03. Development and education - Learning and instruction

Rocío Rodríguez-Rey, Autónoma University of Madrid, Madrid - Spain
Jesús Alonso-Tapia, Autónoma University of Madrid, Madrid - Spain

Usually, technology-enhanced learning environments (ITSs) are designed to foster active learning in order to encourage meaningful knowledge construction. ITSs are commonly used in many educational contexts, including university education. These resources have many advantages, being the main one its availability and the fact that it allows students to receive immediate feedback, building their knowledge by scaffolding. We applied ITSs in the context of teaching Psychological Assessment, a compulsory subject in the Degree in Psychology. As this subject requires that the students acquire not only theoretical learning, but also practical skills, it is important that they have the opportunity to put in practice what they learn. Thus, we hypothesize that the introduction of a complementary online resource to solve problems receiving immediate feedback will improve student’s meaningful learning. With this purpose we designed an online training program based in the guided step by step resolution of different cases. Students had this resource available during the entire course. At the end of the course, we assessed how often had the students used it, in which way they used it and if its utilization was related to a higher level of significant knowledge assessed from their results in the class assignments and in the final exam. We found that online training is useful to help students in their process of learning, so this methodology could be generalized to teach many other subjects.
The admission of a child to a Pediatric Intensive Care Unit (PICU) is a highly stressful event for parents. Commonly identified stressors include the loss of parental role, uncertainty, and seeing their child in pain. Our aims were 1) Studying which are the most stressful aspects of the PICU and which variables are related to stress among Spanish parents and 2) Studying the psychometric properties of a questionnaire to assess parental stress in PICU. A total of 196 parents completed the stress scale after child’s discharge. Three and six months later we assessed anxiety, depression, posttraumatic stress disorder (PTSD) and posttraumatic growth (PTG). Reliability, correlation, and Confirmatory Factor Analyses (CFA) were conducted. The most stressful aspects were the behaviors and emotional responses of the child and the loss of their parental role. Age, gender, severity of the child’s condition, length of admission, spiritual beliefs, and mechanical ventilation were associated to stress. Stress predicted anxiety, depression, PTSD and PTG months after the discharge. Two factors emerged from the CFA of the scale (X2/df=2.65; CFI=.93; IFI=.93; RMSEA=.09) that showed an adequate internal consistency (α=.80) and validity. Parental stress is related to distress months after discharge, so it is crucial to develop interventions to reduce it. This study gives us clues about how these interventions should be designed. Also, our questionnaire is useful for clinical and research purposes.
O763
RELIABILITY AND VALIDITY OF THE SPANISH VERSION OF THE BRIEF RESILIENCE SCALE

A03. General issues and basic processes – Psychometrics

Rocío Rodríguez-Rey, Autónoma University of Madrid, Madrid – Spain
Jesús Alonso-Tapia, Autónoma University of Madrid, Madrid – Spain

Resilience is defined as the ability to recover from stressing circumstances. However, all resilience measures with exception of the Brief Resilience Scale (BRS) (Smith et al, 2008) assess resources that make resilience possible instead of recovery. In this work we attempted to adapt the BRS to Spanish population. The psychometric properties of the BRS were examined in four samples: parents of critically ill children, parents of children with cancer, parents of children with intellectual disabilities or development disorders and general population (total N= 532). Resilience was measured with the Connor Davidson Resilience Scale in all samples. Parents of critically ill children completed a BRS retest along with the Hospital Anxiety and Depression Scale and the Davidson Trauma Scale 3 and 6 months after discharge. Coping strategies were assessed in the other samples. The BRS showed adequate internal consistency (ranging from .72 to .86) and test-retest reliability (ranging from .65 to .76, p<.001). Confirmatory factor analyses showed that the BRS is mono-factorial (X²/df=2.47; GFI=.98; CFI=.98; IFI=.98; RMSEA=.053) Also, the questionnaire showed adequate convergent and predictive validity. Differences in the level of resilience were only significant between parents of critically ill children (mean 18.76) and parents of children with cancer (mean 16.61). In conclusion, the Spanish BRS is a reliable means of assessing resilience as the ability to bounce back.
NEW METHODOLOGICAL ASSESSMENT OF WORK-RELATED STRESS: COMBINATION OF OBJECTIVE, SUBJECTIVE AND PHYSIOLOGICAL DATA

D12. Work and organization - Safety culture and climate

Nunzia Santacroce, Psyche at Work Srl S, Bari – Italy
Roberta Clemente, Psyche at Work Srl S, Bari – Italy

The aim of this study is to present a new method of assessment of Work-Related Stress (WRS). It is a method developed by Psyche at Work Srl S that integrates technical, psychological and physiological approach. According to the guidelines of the Consultative Committee (Legislative Decree 81/08), for the first time in Apulia a company has evaluated the WRS adding three markers of Sympathetic System activity to the organizational data and workers’ perceptions. From theoretical point of view stress includes: a) stimulus, which is the environmental cause of illness (the objective measure); b) perceptive and cognitive transduction of stimulus that causes negative reactions to stimulus (the subjective measure); c) internal reaction of the organism, the physiological changes caused by a dysfunctional activation of the Sympathetic System of the Autonomic Nervous System (the physiological measure). Our design is based on the triangulation criteria of three kinds of WRS data collected by scientifically validated tools: organizational data (sentinel events, factors of work content and work contest); perception of organizational data referred by workers; markers of Sympathetic tone: Heart Rate, Heart Rate Variability and Galvanic Skin Response. We have obtained an accurate WRS value. Moreover, in cooperation with a Job Physician we have validated a diagnosis of hypertension for a worker with higher values of WRS across the three criteria of analysis.
O767
THE FREQUENCY AND ROLE OF POSITIVE EMOTIONS DURING CRISSES AND ITS RELATION WITH POSTTRAUMATIC GROWTH.

E09. Health and clinical intervention - Positivity and well-being

Rocío Rodríguez-Rey, Autónoma University of Madrid, Madrid - Spain
Jesús Alonso-Tapia, Autónoma University of Madrid, Madrid – Spain

The negative effects of traumatic events (mainly posttraumatic stress disorder) have been widely studied; however, more recently some researchers have focused on the role that positive emotions play during traumatic events and its positive effects after crises. In this work we studied the positive and negative emotions that parents experience during their child’s unexpected admission to a Pediatric Intensive Care Unit (PICU) and its effect on posttraumatic growth (PTG) in the aftermath of crisis. A total of 48 parents whose children had been unexpectedly admitted to a PICU answered the Fredrickson’s modified Differential Emotions Scale and the Connor-Davidson Resilience Scale, and 6 months later, the Posttraumatic Growth Inventory. Positive emotions were almost twice more common than negative emotions. The most frequently experienced emotions were gratitude, love and stress/anxiety. Positive emotions were positively correlated to resilience ($r=.46; p=.001$) and to PTG ($r=.423; p=.018$). As regression analysis showed, PTG can be predicted from positive emotions. Half of the parents (51.62%) indicated that they had experienced a positive change to a great degree as a result of their child’s admission. Those who experience positive emotions in the midst of the traumatic event were more likely to have higher resilience and to experience more PTG. The mechanisms by which positive emotions produce better long term outcomes as well as implications for intervention are discussed.

RELATIONSHIP BETWEEN ETHNIC PREJUDICE AND LIFE-TIME TRAUMA EXPOSURE IN LITHUANIA

C08. Culture and society - Prejudice and social exclusion

Paulina Želvienė, Vilnius University, Vilnius - Lithuania
Evaldas Kazlauskas, Vilnius University, Vilnius – Lithuania

Background: Prejudice research revealed more than 25 individual variables related with prejudice, however little is known about effects of trauma exposure on prejudice. Our main goal of this study was to examine the relationship between ethnic prejudice and life-time trauma exposure. Methods: Sample of 626 participants (59.9 % women, 40.1 % men) from Lithuanian general population with a mean age 39.00 (SD = 18.13) from 18 to 89 years participated in our study. Prejudice against minority ethnic groups in Lithuania was measured by self-report Ethnic Prejudice Questionnaire (EPQ) developed by the authors of this study. Life-time trauma exposure was measured using the Brief Trauma Questionnaire (BTQ). Results: Data analysis revealed significant effect of trauma exposure to prejudice. Participants with high ethnic prejudice were more likely to have experienced at least one traumatic event. Participants who reported high ethnic prejudice also had experienced significantly more traumatic events than in low prejudice group. Conclusions: Our study expands current knowledge on the variables related with prejudice, indicating, that exposure to traumatic events might be important in understanding ethnic prejudice.
O783
EFFECTIVENESS OF TRAUMA-FOCUSED PSYCHOSOCIAL INTERVENTION: VILNIUS BEPP PILOT STUDY RESULTS

E05. Health and clinical intervention - Evidence based psychotherapies

Lina Jovarauskaite, Vilnius University, Vilnius – Lithuania

Background. In the last few decades, a growing number of studies revealed the effectiveness of Brief Eclectic Psychotherapy (BEPP) for patients with posttraumatic stress disorder (PTSD). The aim of the current study was to evaluate the effectiveness of BEPP treatment on PTSD symptoms as well as functioning and subjective well-being in Lithuania. Method. 15 patients (1 man and 14 women), aged from 20 to 55 years, participated in the current study. Participants had experienced various traumatic events such as sexual, physical abuse, car accidents. Clinical assessments were carried out three times before, after the treatment and six months later. Symptoms of PTSD were measured using Impact of Event Scale -Revised (IES-R), CAPS, and to evaluate dynamics of functioning and subjective well-being were used CORE Outcome Measure (CORE-OM). Results. Comparing pre-treatment, post-treatment and follow-up results there was a significant reduction in symptoms of PTSD. Also there were revealed a significant improvement in daily functioning and subjective well-being after the treatment and at 6 month follow-up. Conclusions. The current study showed positive effects of BEPP therapy in decreasing PTSD symptoms, improving functioning and subjective well-being.
O795
RECOGNITION OF ANGER DEPENDING ON TEMPERAMENTAL TRAITS

B08. Development and education - Bullying and aggression

Elena Vorobyeva, Southern Federal University, Rostov-on-Don - Russian Federation
Vladimir Kosonogov, University of Murcia, Murcia - Spain
Alisa Titova, South Russian Institute for Humanities, Rostov-on-Don - Russian Federation

The current study explored the link between temperamental traits and the recognition of anger. Participants (N = 69) watched morph faces which consisted of 100 frames (pictures) depicting a gradual transition from anger to neutral face and vice versa. They were to indicate (without time restriction) at which frame (1-100), in their opinion, the face changed its expression. Structure of Temperament Questionnaire was used to measure temperamental traits of participants. We found positive correlations between the point of change from anger to neutral face and social ergonicity (Pearson's r = .29, p = .01) and self-confidence (Pearson's r = .39, p = .001), that means that participants with the high level of these traits recognised better anger in fading expressions. Therefore, people with a high social ergonicity and self-confidence are more resistant to perception of angry faces. We also found negative correlations between the point of change from neutral face to anger and empathy (Pearson's r = -.24, p = .04) and intellectual endurance (Pearson's r = -.29, p = .01), that means that participants with the high level of these traits recognised earlier anger in appearing expressions. They empathise better and recognise anger faster, but it depends not only on empathy, but on intellectual ergonicity as well. Taking into account that ergonicity (both social and intellectual) is a highly hereditary temperamental trait, the found features of anger recognition may be hereditary as well.
O798
THE RELATIONSHIP OF AUTOBIOGRAPHICAL MEMORY AND DEPRESSIVE SYMPTOMS FOLLOWING CHILDHOOD TRAUMA

A09. General issues and basic processes - Learning and memory

Gülşen Kaynar, Ankara University, Ankara – Turkey
Nurhan Er, Ankara University, Ankara – Turkey

The main purpose of this study is to compare autobiographical memories between two groups with and without childhood trauma and to examine mediator role of autobiographical memory in the relationship between childhood trauma and depressive symptoms. For this purpose, this study was conducted in two stages. The data have gathered from 198 participants aged 19-30 at the first part of the study. By reaching again 46 participants with only a history of childhood trauma from 198 participants, the second part of the study was created. One by one interview held with the participants at this stage. In the course of evaluating the data, the memories (positive, negative and comparison) have been compared according to three basic dimensions including overgeneralization, detail of memory and effect of memory. Additionally, the role of intrusive and avoidance were examined in relation between childhood trauma and depressive symptoms. The results showed that participants with childhood trauma recalled more detailed memories of negative childhood experience than participants without childhood trauma. But this effect reversed in positive and comparison memories. In addition, it was found that the depressive symptoms are predicted by childhood trauma experiences and levels of intrusive and avoidance mediate this relationship. These findings are discussed in the light of autobiographical memory literature.
O801
OBJECT-SPECIFIC SHORT-TERM MEMORY IN HEALTHY ELDERS VERSUS YOUNG ADULTS: HIGH-DENSITY ERP AND BEHAVIORAL STUDY

A06. General issues and basic processes - Cognitive neurosciences and neuroimaging

Elena Mnatsakanian, Institute of HNA & Neurophysiology RAS, Moscow - Russian Federation

We aimed at studying the changes in short-term memory for different kinds of visual stimuli due to healthy aging. Young adults (10 female and 12 male), aged 20-30 years and elder adults (12 female and 12 male), aged 50-70 years, performed three delayed match-to-sample visual tasks. The stimuli were monochrome photographs of unfamiliar faces, patterns composed of 8 squares, and 5-letter Russian abstract nouns. Participants had to memorize the first stimulus in a pair and compare it to the second item presented with 2000 ms delay. The instruction was to press different buttons for matching and mismatching items. We recorded 128-channel EEG/ERP and analyzed the visual response elicited by the first item in a pair and the following slow potential (CNV), i.e., the encoding and short-term maintenance of information. The rates for Elder group were lower, the motor reactions were longer, and the individual variability was higher compared to Young group in all tasks. The ERP amplitudes were reduced for geometric pattern encoding, and enhanced for faces and words in the Elder group (p<.05) in 150-250 ms. The reduction of activity was task-specific in 450-900 ms (LPP and early CNV). The non-specific amplitude reduction (p<.05) was in P100 (90-140 ms) and P300 (250-450 ms), and the non-specific amplitude increase was in N280 (250-450 ms) and CNV (900-2000 ms) in the central region. This increased brain activity in Elder group can be a compensation for age-related cognitive changes.
The main aim of this study is to investigate the relationship between values and consumption, and to adduce the mediating roles of materialism in this association. Values have been investigated through Schwartz's main value dimensions in his Theory of Human Values: Self-Enhancement, Self-Transcendence, Openness to Change and Conservation. Through the scope of Homer and Kahle's Value-Attitude-Behavior model; the multiple relations and nomological network between the variables individual values-materialism-shopping were investigated. The study was conducted on 485 participants and the data were gathered through Schwartz's Portrait Values Questionnaire, Materialism Scale and Consumption Habits Survey. In order to test the hypotheses, partial correlation analyses and hierarchical linear mediated regression analyses were used as statistical methods. The results showed that shopping frequency is positively related with Self Enhancement, while its associations with Self-Transcendence and Conservation were negative. In the analyses conducted to reveal the mediating role of materialism between values, Self-Enhancement, Self-Transcendence and Conservation, and frequency of shopping; it was found that when materialism was entered in the regression equation, the standardized regression coefficients of the values became insignificant; showing that materialism fully mediated the relationship between values and the frequency of shopping.
WRITING SKILLS OF NATIVE ITALIAN SPEAKERS AND SECOND-LANGUAGE LEARNERS IN PRIMARY SCHOOL: A LONGITUDINAL STUDY

B03. Development and education - Learning and instruction

Carmen Gelati, University of Milan-Bicocca, Milan - Italy
Maestri Grazia, University of Milan-Bicocca, Milan - Italy
Federica Durante, University of Milan-Bicocca, Milan - Italy

Writing is a demanding task that involves many cognitive processes. As reported in the literature, such a task is even more complex for second-language (SL) learners who have more difficulties in spelling and text composition. This study aimed to analyze the following: a) the differences between native speakers and SL learners in Italian primary schools; b) the specific writing skills affected; and c) the role of motivation (self-concept of writing). The participants were 198 primary school students (94 male, 104 female): 102 in 3rd grade (51 Italian, 51 SL learners) and 96 in 5th grade (48 Italian, 48 SL learners). Tasks and standardized tests were administered at the beginning and the end of the school year to measure self-concept in writing, handwriting fluency, spelling, sentence construction, and text production (length, sentence complexity, quality, correctness and structure). Repeated measures ANOVA and MANOVA were performed. Italian children perceived themselves as more competent, achieved better performance in spelling, sentence construction and wrote better, more correct, and complex texts independent of grade. Although the performance of SL learners improved, the gap with native speakers persisted at the end of the school year. A regression analysis also showed that self-concept in writing predicted text quality. These results indicate that instructional intervention focused on the identified difficulties and motivation to write is necessary for SL learners.
The new concept of teacher education in Russia is intended to change the system of teacher training. Unfortunately it is not based on knowledge of the psychological characteristics of today's students. In 2013 we studied cognitive abilities, psycho-emotional portrait, psychosocial characteristics and psychophysical condition of students of teacher training institution of higher education. We used pupillometer "SS & S" (Sambon Stress & Soul pupillometer), which allows to determine the physiological and psychological characteristics of a person based on the analysis of the pupil's reaction to the light flash. 466 students took part in our research: 331 females, 135 males. Pupillometry demonstrated that about 13 % of students had intensive, and 11.04% acute pathological fatigue, thus, a fifth of the surveyed needed rest and recovery. 17% of students showed the residual effects of resource loss. About 11-14% of the students had excessive, pathological neuroticism, anxiety, emotional impulsivity and extraversion. The attention switching exceeded the age norm by one third. 13.95% showed extremely fast switching, high distractibility, inability to concentrate on one thing, reduced ability to memorize and remember the information. The results of study show the actual need of psychological support of the education process in higher educational institutions.
The aim of the presentation is to discuss the neuropsychological approach in the assessment of gifted children. The use of different tools for the clinical assessment of gifted children is warranted by the existence of different aspects of giftedness as well as great variation within this population (Assouline et al., 2010; Flanagan et al., 2010; Sternberg, 2007). Using the Cattell-Horn-Carroll theory (CHC; McGrew, 1997) and the Planning Attention Simultaneous Successive theory (PASS; Das et al., 1994), the present study explores the performance and the executive functioning underlying the information processing of a sample of 42 Italian gifted children aged 6 – 13 years. All children were administered the Wechsler Intelligence Scale for Children - 4th Edition (WISC-IV; Wechsler, 2003) and the Cognitive Assessment System (CAS; Das, Naglieri, 1997). The WISC-IV results reveal a lower performance in processing speed and working memory when compared to verbal comprehension and perceptual reasoning. CAS scores indicate simultaneous processing as gifted children’s preferential modality of learning. A comparison between the two instruments reveals that attention has an important role in the profile of these children. The integration of the two approaches could explain different aspects of giftedness and have diagnostic utility, particularly in the identification of twice exceptional gifted. The findings also make a useful contribution to intervention planning for gifted children.

COURSE OF SUBCLINICAL POSITIVE AND NEGATIVE PSYCHOTIC SYMPTOMS AND THEIR ASSOCIATIONS WITH CLINICAL AND FUNCTIONAL OUTCOME

E16. Health and clinical intervention - Other

Mayke Janssens, Maastricht University, Maastricht - Netherlands
Lindy-Lou Boyette, University of Amsterdam, Amsterdam - Netherlands
Henriëtte Heering, University of Amsterdam, Amsterdam - Netherlands
Tineke Lataster, Maastricht University, Maastricht - Netherlands

Previous research has shown that the persistence of subclinical positive psychotic symptoms is one of the mechanisms involved in transition from health to psychotic disorder. The present study investigates the influence of the course of subclinical symptoms on clinical as well as functional outcome in individuals with average and high genetic risk of psychotic disorder. We investigated (i) whether this mechanism is unique to subclinical positive symptoms or can be extrapolated to subclinical negative symptoms, and (ii) what the role of genetic risk is on the development of persistent subclinical symptoms and on the subsequent association with outcome. A broad perspective on outcome was taken, assessing various measures of clinical as well as functional outcome. Results show that, in addition to the more widely studied subclinical positive symptoms, the persistence of subclinical negative symptoms is also associated with poor outcome. This underscores the importance of assessing the temporal course of both symptom clusters in relation to clinical and functional outcome. Moreover, the course of subclinical psychotic symptoms was shown to be under the influence of genetic risk, with high genetic risk associated with more persistent subclinical symptoms. The subsequent effect of persisting subclinical symptoms on outcome, however, was not contingent on genetic risk. This suggests that the influence of genetic risk is most prominent in the early stages of symptom-development.
O855

ORIENTATION ON TEAM ROLES CONNECTION WITH GENERAL ENTERPRISING TENDENCY AMONG WORKERS OF PRODUCTION ENTERPRISES

D03. Work and organization - Teams performance

Alina Bezditko, G.S. Kostyuk Institute of Psychology, Kiev - Ukraine
Irina Bondarevskaya, G.S. Kostyuk Institute of Psychology, Kiev – Ukraine

The objective of this research is to reveal connections between orientation on team roles and general enterprising tendency. The research was conducted among 268 workers of production enterprises in Dniprodzerzhynsk and Zaporizhzhya who were engineers, economists and managers. Respondents were 34 % male and 66 % female. Belbin’s method and General Enterprising Tendency Test were used in the research. Results showed positive statistically significant correlation between orientation on team role “plant” and enterprising abilities (p = 0,000). Thus, the more developed are enterprising abilities among production enterprise workers the more often they tend to be oriented on the team role “plant”. Negative statistically significant correlations between enterprising abilities and orientation on team roles “shaper” (p = 0,033), “teamworker” (p=0,000), and “completer” (p=0,015) enable to conclude that the more developed are enterprising abilities among production enterprise workers the less they are apt to orientation on the team roles “shaper”, “teamworker”, and “completer”. It is possible to conclude that development of enterprising abilities among workers oriented on team roles “shaper”, “teamworker”, and “completer” would enrich teamwork with wider variety of work implementation. The results of the study can be used by organizational psychologists as well as managers of organizations in the process of recruitment and implementation of organizational training.
Gender differences have been reported on vocational interests with men scoring higher on investigative and realistic interests that pertain to Science, Technology, Engineering, and Math (STEM) areas. The present study extends STEM-related vocational gender differences by utilizing an assessment of interests towards STEM tasks with increasing complexity. Specifically, interest complexity was measured within the domains of numeric tasks, symbolic tasks, spatial tasks, and STEM-related ideas. In a sample of 459 university students enrolled in STEM majors, men indicated higher interests in all domains than women. A reduced sample of 271 students was given descriptions of three clusters of STEM occupations obtained from the ONET database, which spanned high, medium-to-high and medium complexity occupations as indicated by the Dictionary of Occupational Titles. Descriptions of each cluster included occupational titles (e.g. electrices-electronics technician), basic activities, and skills, abilities (e.g. critical thinking, technology design, originality) characterizing the complexity level of the cluster. Women reported intentions for working in medium-to-high and high-complexity occupations to a lesser extent than men. According to regression analyses the association between gender and complex occupational career intentions disappeared when symbolic and spatial interests were entered into the equation, indicating the importance of such interests in career orientation.
The main goal of the study was to investigate the role of proactive coping in well-being in the new workplace. The study was conducted among individuals who are especially vulnerable for negative effects during adaptation process, namely organizational newcomers. The sample consisted of the new workers (n=140) who voluntary agreed to participate in the study. The relationship between psychosocial factors and proactive coping in a new workplace have been examined in relation to job satisfaction and stress. The regression analysis showed significant relation between proactive coping and job satisfaction. In follow, mediation analysis indicated this kind of coping as mediating the relation between both, self-efficacy and emotional costs, and job satisfaction. The social support was assumed in the study as an important environmental factor during adaptation process. The results demonstrated direct and moderation effect of received social support on proactive coping and its relation to newcomers’ well-being.
MODERATION OF RESOURCES DEPLETION: DIFFERING EFFECTS OF AUTONOMY SUPPORTING VS. CONTROL EXERTING AND INDIVIDUAL DIFFERENCES IN ACTION CONTROL MECHANISMS EFFICIENCY

A11. General issues and basic processes - Motivation and emotion

Romana Kadzikowska-Wrzosek, University of Social Sciences and Humanities, Faculty in Sopot, Sopot, Poland

According to Baumeister and colleagues the strength ego model, self-regulation appears to deplete a needed resource, which leads to poorer regulation subsequently (Baumeister, Heatherton & Tice, 1994). However, in the light of the research results it seems that the autonomously motivated self-regulation may be less depleting than extrinsically motivated self-control (Moller, Deci & Ryan, 2006; Muraven, 2008; Muraven, Rosman & Gagné, 2007; Ryan & Deci, 2008). Three experimental studies were designed to answer two questions: First - does external control versus autonomy support has different effect on the amount of depletion? Second – do individual differences in state vs. action orientation (Kuhl, 1995) moderate the amount of depletion in the context of control vs. autonomy support? Consistent with expectations the amount of “ego depletion” was greater in external control context then in autonomy supporting context. Depletion effect was also less for action –oriented participants with autonomy supporting instruction than for state –oriented participants with the same instruction. Action –oriented participants were greater depleted when instruction for “depleting ego” task didn’t explain reasons for doing this task. The interaction between the type of depletion manipulation and individual differences in state vs. action control suggests that the amount of effort which requires self-regulation depends in part, on the level of autonomy experienced.

CULTURE AS INTERVENTION

C07. Culture and society - Race and ethnicity

Susana Helm, University of Hawaii at Manoa, Honolulu - United States

Scott Okamoto, Hawaii Pacific University, Honolulu - United States
Wayde Lee, Kahua Ola Hou, Hoaloha58, Kaunakakai - United States
Vanda Hanakahi, Hoaloha58, Kaunakakai - United States

Purpose. This presentation will describe the concept of “culture as intervention.” Theory/Rationale. While multicultural and cross cultural psychology theories are well recognized, the age of globalization marginalizes culture-specific ideologies. This is relevant in the United States where health disparities continue to plague colonized people and places, such as Hawai`i and indigenous Hawaiians. Not only is “culture as intervention” requested and often demanded by indigenous and ethnic/racial minority communities, tribes, and elders, there is a burgeoning literature supporting the approach. Methods/Results. Case studies are described. 1) Ho`ouna Pono is a school-based intervention where the majority of students Hawaiian. Based on mixed-methods pre-prevention studies, a video-enhanced curriculum was developed with students, in collaboration with local schools where it is implemented. 2) Puni Ke Ola is a grassroots effort to eliminate drug and alcohol related health disparities in Hawaiian communities. Using photovoice with Hawaiian teens, the intervention was identified, then validated via community based cultural auditing and scholarly activities. Conclusion/Implications. Culture as intervention requires deep-structure culture-centric knowledge around which an intervention is developed, implemented, and evaluated; thus must be community science. The link between culture and community science will be highlighted, as it pertains to equitable growth in the globalization era.
EFFECTIVENESS OF MINDFULNESS IN SMOKING CESSATION

Aimiliza Stefanidou, Aristotle University of Thessaloniki, Papanikolaou Hospital, Thessaloniki - Greece
Athanasia Pataka, Aristotle University of Thessaloniki, Papanikolaou Hospital, Thessaloniki - Greece

Despite the existing smoking cessation interventions, quit rates remain low and relapse the most likely outcome of any given cessation attempt often associated with psychological stress and negative affect. The purpose of this paper is to highlight the psychological construct of mindfulness and provide an overview of the empirical literature on the effects of mindfulness training, as a novel yet promising treatment intervention for smoking cessation. Mindfulness, through its present-moment awareness trait may facilitate smoking cessation by weakening associations between distress and behavioral responses and lessening the tendency of smokers to reduce negative affect by smoking. Emerging evidence suggests that mindfulness-based approaches to smoking cessation may be effective for many smokers but even more to some neglected subgroups in smoking cessation research such as weight-concerned or highly anxious smokers. Finally, the paper outlines the need for future research to incorporate mindfulness practices in clinical smoking cessation treatment and relapse prevention.
THE RELATIONSHIP OF MOTHER’S ATTACHMENT OF HER CHILD WITH HER REACTIONS IN EMOTIONAL SITUATIONS

Elena Nikolaeva, Petersburg State Transport University, Herzen State Pedagogical University, Saint Petersburg - Russian Federation
Vera Merenkova, Eletz State University, Eletz - Russian Federation

The purpose of this research was to show the connections of the mother’s attachment with her heart rate variability in emotional situations. Overall 100 mothers with children in their first years of life were examined. A questionnaire evaluating the attitude of a mother toward a child during its first two years of life (Vereshagina & Nikolaeva, 2009) was used. To analyze the heart rate variability of mothers three consecutive recordings of 300 R-R intervals (a fixed number, making it possible to successfully evaluate the high and low frequency waves of the heart rate) were made. The first record was made in the rest situation, during the second record mothers were asked about positive situations connecting with their children and during the third record mother were asked about any negative situations with their children. There were a few numbers of mothers with high level of attachment. We have shown the connections between mother’s attachment and heart rate variability just for mothers with children in their first year of life. There are no any relationships between parameters of mothers with children in their second year of life. The higher the mother’s attachment level was the higher her heart rate variability during remembering of the positive situations with the child and the low level of variability during remembering of negative situations. These connections were vice versa for mothers with low attachment level. The work is supported by grant of RGNF № 14-16-48005 a(p)

NUTRITION AND GASTROINTESTINAL CONDITIONS IN AUTISM SPECTRUM DISORDERS: IS THERE A LINK BETWEEN GUT MICROBIOTA AND ASD?

F02. EXPO 2015 Hot Topics - Nutrition, development and well-being

Ilaria Basadonne, University of Trento, Rovereto – Italy
Alessandro Zandonà, University of Trento, Trento – Italy
Cesare Furlanello, Bruno Kessler Foundation, Trento – Italy
Paola Venuti, University of Trento, Rovereto – Italy

Autism Spectrum Disorders (ASD) are early-onset pervasive neurodevelopmental disorders characterized by social and communication impairments, restricted interests and stereotyped behaviors. To date, hereditability studies and the existence of different ASD phenotypes lead to the hypothesis that ASD is a multifactorial pathology where a genetic predisposition interacts with environmental factors. Moreover, gastroenterological studies indicate a high incidence of gastrointestinal disorders among ASD, but the cause is still unclear. For this study we collected information about gastrointestinal conditions of ASD children, their nutritional history (e.g. formula milk during lactation) and present diet (e.g. food selectivity, gluten or casein free diet) and related them to each other and to children’s ASD phenotype. We also explored how these aspects are managed by parents and at school, and which difficulties parents may face, in order for us to plan a support intervention. Furthermore, supported by the concept of brain-gut-microbiota axis (the complex system of bidirectional interactions between central nervous system, gastrointestinal tract and microorganisms inhabiting the gut), we hypothesize a possible role for microbiota in ASD etiology. Hence, we are going to typify the microbiota of ASD children, their parents and a not affected sibling with metagenomic technics in order to evaluate its composition in light of genetic proximity, nutritional habits and ASD phenotype.
COMMUNICATION, FAMILY AND SEXUAL HEALTH IN COLOMBIAN COLLEGE’S STUDENTS

Ana Fernanda Uribe Rodriguez, Universidad Pontificia Bolivariana Bucaramanga, Bucaramanga – Colombia

Communication and family functioning are protective factors in sexual and reproductive health, strengthens self-care and reduce psychosocial risk behaviors in college students. The aim is to establish the relationship between family communication and sexual and reproductive health among university students in Colombia. The design is exofacto with a non-probabilistic sample. The sample consisted of 489 university students and 138 parents of three Colombian cities (Bucaramanga, Cali and Cúcuta). The average age was 19.4 years, and TD of 2.5. MOS, and APGAR CCVSA (MOH, 1997) instruments were applied. The results indicate that family functioning and social support reduce risk behaviors of college students. Communication on issues related to planning, sexual behavior and relationships is higher among college students and their mothers. Gender difference were identified in educational guidelines on sexual health, being more lenient with men. The main risk behaviors are the number partners (x = 6 per year), no condom use, substance abuse and lack of information. There is a correlation between social support and sexual risk behaviors. Parents-offspring relationships contribute to affective and effective communication on sexual and reproductive health. Promotion and prevention in family contexts reduce risk behavior and increase self-care behaviors.
A NOVEL APPROACH TO INCREASING EVIDENCE-BASED PRACTICE IN THERAPY: DEVELOPMENT OF AN ONLINE MOTIVATIONAL TOOL FOR CLINICIANS

Despite the well-established efficacy of psychotherapy, a small but important percentage of clients fail to improve or even deteriorate in therapy. Monitoring client progress through the use of Progress Monitoring (PM) measures has been shown to be an effective way for clinicians to identify clients who are not progressing well in treatment. These measures also provide clinicians with a number of other benefits, which include improved client outcomes, reduced no-show rates and providing a means for service quality evaluation. However, the majority of practicing therapists are unfamiliar with these measures. Currently there are no instruments to guide practitioners in choosing a measure that fits their practice. Based on the Knowledge-to-Action (KTA) framework, the current research sought to create an informational/motivational tool to increase PM usage and to assist clinicians in selecting an appropriate measure. Results from the largest survey of Canadian Psychologists’ perceptions toward PM measures in 2012 were used to inform the creation and development of this online tool. This paper presents a novel approach to transforming research into an applicable format for clinicians to use in their practice. Future directions of this project will be discussed, including ways to optimize PM utilization and dissemination strategies for the website. This program is one strategy to engage experienced therapists in increasing evidence-based tools in their practice.

NARRATIVE STRUCTURE AND AFFECTIVE TONE OF LIFE STORIES AND POSTTRAUMATIC GROWTH IN ORGAN TRANSPLANT RECIPIENTS

E09. Health and clinical intervention - Positivity and well-being

Marta Boczkowska, University of Social Sciences and Humanities, Warsaw – Poland
Mateusz Zatorski, University of Social Sciences and Humanities, Poznan – Poland
Mariusz Zięba, University of Social Sciences and Humanities, Poznan – Poland

Narrative is a way of organizing episodes, actions, and accounts of one’s actions (Sarbin, 1986). Many authors indicate that construct cognitive representation of traumatic events in a narrative form plays a positive role in the process of the re-adaptation to trauma (McAdams, 2012; Neimeeyer, 2001, 2006; Pennebaker & Seagal, 1999). The affective tone of narration is created in early childhood, affects the narrative form during the entire human life (McAdams, 1993) and involves the satisfaction of life and psychological well-being (McAdams et al., 2001). We present the study of organ transplant recipients: after having a kidney (N= 51) or liver (N= 48) transplant. In the first stage of the study, 4 weeks after transplantation, the participants told two stories about important, freely chosen events from their lives. Nonetheless, one of the events should come from the period while waiting for the transplant. During the second meeting, which took place 10–12 months later, the posttraumatic growth and the level of patients’ life satisfaction were measured. Medical information on the patients’ health condition was also gathered. It was found that the affective tone of narration concerning events from the past was associated with the level of posttraumatic growth measured 10–12 months later. Also important is the tendency to construct stories about their experiences in narrative form.
This paper will present data from studies on students with reading disabilities toward illuminating mechanisms critical to fluent-reading development. Fluency remains of the utmost importance as even for interventions effective for word-reading accuracy and reading comprehension, fluency standard-scores remain far below typically-achieving peers (see Torgesen & Hudson, 2006). Theories of reading acquisition have frequently emphasized the role of increasing orthographic knowledge in fluent reading development (e.g., Ehri, 2014). While fluency-interventions for English students tend to focus at the level of connected-text reading (e.g., Chard et al., 2009), for more transparent orthographies interventions may be more apt to focus on sublexical training (e.g., Heikkilä et al., 2013). Results from the presented studies will demonstrate the unique prediction of automaticity and learning measures for sublexical orthographic patterns on later reading fluency, and in an intervention targeting this knowledge, show increased standard fluency-scores. English-language readers who have a specific fluency-deficit are examined, as response to reading interventions may be similar to disabled readers in more transparent orthographies for which fluency is the major difficulty. Implications for developmental theories of fluent-reading across more and less transparent orthographies are discussed within this context of attention to sublexical orthographic knowledge and automaticity.

THREE-YEAR CORRELATION BETWEEN TRAFFIC ACCIDENTS AND CAR-DRIVER OFFENCES

D10. Work and organization - Traffic and transportation

Tsuneo Matsuura, Jissen Women's University, Tokyo - Japan
Yasushi Nishida, Institute for Traffic Accident Research and Data Analysis, Tokyo - Japan

Some analyses with official statistics indicate a weak correlation between traffic accidents and offences. Traffic offences are thus risky behavior causing traffic accidents. However, this relationship may be due to the effect of travel distance on accidents and offences. The research examines whether there is still a correlation after the effect of travel distance is eliminated. We issued questionnaires to drivers who came to driving license centers to renew their driving licenses. Japanese drivers must renew their driver licenses every 3 or 5 years. Survey items included age; sex; the number of at-fault accidents, not-at-fault accidents, and traffic offences for the last three years; annual travel distance (kilometers-driven); and type of vehicle driven. Car drivers who replied correctly to the items were analyzed (n = 6,250 for males and n = 4,796 for females). The correlation between accidents and offences was $r = .16$. Although the relationship was weak, the accident rate of drivers with one or more offences was 2.5 to 4 times larger than that of drivers with no offence. The partial correlation after removing the effect of travel distance was the same as the above-mentioned correlation ($r = .15$). The correlation for aged drivers (65+) was $r = .26$, higher than that for all drivers. We conclude that the weak correlation between accidents and offences was not a spurious correlation due to the effect of travel distance. A higher correlation for aged drivers suggests that their driving behavior leading to traffic offences is more likely to cause traffic accidents.

PRIMARY CARE TEAM COMMUNICATION NETWORKS, QUALITY OF CARE AND COSTS FOR PATIENTS WITH TYPE 2 DIABETES

D03. Work and organization - Teams performance

Marlon Mundt, University of Wisconsin-Madison, Madison - United States
Filip Agneessens, University of Surrey, Guildford - United Kingdom
Wen-Jan Tuan, University of Wisconsin-Madison, Madison - United States
Larissa Zakletskaia, University of Wisconsin-Madison, Madison - United States
Valerie Gilchrist, University of Wisconsin-Madison, Madison - United States

Introduction: While emerging consensus shows that primary care teams play an important role in providing the best quality of care to patients with diabetes, little evidence is available on how communication and coordination contribute to the team’s capacity to deliver high quality care at lower cost. We investigated how primary care team communication patterns (or networks) may contribute to higher quality of care and lower cost for patients with diabetes. Methods: We surveyed 155 health professionals at 6 US primary care clinics about team communication and climate. Generalized linear mixed modeling (GLMM) related in-degree (communication ties directed to an individual) and density (ratio of communication ties present out of total ties possible) of face-to-face and electronic communication to patient outcomes, health utilization, and costs, while adjusting for patient-level and clinic-level covariates. Results: A one standard deviation increase in face-to-face communication density within the primary care team was associated with 50% fewer hospital visit days and US$1215 per patient lower health-care costs in the past 12 months for the team’s diabetic patients. Diabetic patients of teams with more than a single RN communicating with the MD had 72% more hospital visit days, and US$845 greater health care costs. Discussion: Interventions targeting primary care team social interactions may improve outcomes for patients with diabetes and reduce health-care utilization and costs.

IMPACT OF A MILD PERINATAL PATHOLOGY OF CENTRAL NERVOUS SYSTEM ON THE MENTAL DEVELOPMENT OF CHILDREN

B14. Development and education - Developmental disorders in health

Alfiya Sultanova, Russian Academy of Education, Moscow - Russian Federation

Perinatal pathology of nervous system (PPNS) is one of the most important factors which cause deviations of ontogenesis. The purpose of this study was to analyze the mental development of children with mild PPNS in their medical history. 170 children, 5-9 years old, have been investigated: 1) 100 neurological healthy children with mild PPNC in their anamnesis; 2) 70 healthy children without perinatal damages CNS. We used neuropsychological Luria's tests, parents’ and teachers’ surveys, cognitive tests. Research results showed that in the preschool period (age 5-6 y.) two major violations are the bases of deviations in mental development: neurodynamic dysfunctions (inertness, fatigability, sluggishness or hyperactivity etc.) and the lack of development of executive functions. At the beginning school education (age 7-9 y.) the deficit of executive functions and mild developmental disorders of mental processes are the main features of these children. Significant differences between groups were obtained in the study of voluntary attention, verbal memory, visual and tactile gnosis, phonemic hearing. The children more often have learning difficulties in reading, writing, getting used to the school rules. These deviations led to the secondary disorders - reduced cognitive motivation, low self-esteem, disruption of relationships with peers. Thus, children with mild PPNS need the complex medical-psychology-social assistance for optimization of course of mental development.
A VOYAGE OF DISCOVERY: A PSYCHOLOGICAL LOOK INTO REASONS BEHIND THE PERSISTENT READING OF ESCAPIST FICTION

Rebecca Blyth, Victoria University, Melbourne - Australia

The purpose of this presentation is to delve into the psychological reasons behind why people keep reading escapist fiction, and constantly devouring more. The three key reasons that I will look at and argue are: the fundamental human needs of discovery, adventure and love; identification and verisimilitude with fictional life stories helping reality; and the escapist experience with transportation and flow states that leave the reader wanting to stay in the fictional world and replicate that experience. Some research has been done into different reasons why people read fiction for leisure, the effects on the reader and theories of narrative transportation, but I have found nothing that discusses in-depth why readers want to repeatedly escape into a fictional world beyond that of relaxation and distraction. This research paper is based on different theoretical research and its application to the subject, but also the use of quotes from escapist fiction novels to illustrate the ideas discussed. Although further empirical research will enhance the knowledge in the field, from this research I found that the outlined key reasons behind constantly seeking an escape into a fictional world are valid and invaluable in the psychological research into reading habits. Experiencing the foreign in the escape is satisfied with the safety of reality, while readers are stimulated by the act of mentally visualising the unfolding events, expanding one’s mental capacities and well-being.
O920
THE INFLUENCE OF RELATEDNESS NEED SATISFACTION BETWEEN CHARITABLE BEHAVIOR AND WELL-BEING IN CHINA

B05. Development and education - Moral development and prosocial behaviour

Taoran Zeng, Beijing Normal University, Beijing - Chine
Jiang Jiang, Beijing Normal University, Beijing - Chine
Yannan Ke, Beijing Normal University, Beijing - Chine
Chong Zhang, Beijing Normal University, Beijing - Chine

According to the self-determination theory, the goal of current study was to explore the potential mediating effect of relatedness need satisfaction between the relation of charitable behavior and well-being in China. Study 1 was a cross-sectional design using questionnaires. Participants were asked to complete the charitable behavior scale, the relatedness need satisfaction scale, and the personally expressive activities questionnaire online respectively. The results indicated that charitable behavior in daily life satisfied the individuals’ trait relatedness need, and then increased both hedonic and eudaimonic well-being. Study 2 is a field experiment. After being primed donation behavior by a scenario, participants’ state relatedness need satisfaction and well-being were measured. The results also showed that charitable behavior promoted individuals’ hedonic and eudaimonic well-being through satisfying inner relatedness need. In other words, relatedness need satisfaction played a mediating role between charitable behavior and hedonic/eudaimonic well-being. The current research reveals a mechanism by which charitable behavior increases both hedonic and eudaimonic well-being through the mediating influence of the satisfaction of relatedness need in China. Keywords: charitable behavior, relatedness need satisfaction, well-being, hedonic well-being, eudaimonic well-being, self-determination theory
The new concept of teacher education in Russia is intended to change the system of teacher training. Unfortunately it is not based on knowledge of the psychological characteristics of today's students. In 2013 we studied cognitive abilities, psycho-emotional portrait, psychosocial characteristics and psychophysical condition of students of teacher training institution of higher education. We used pupillometer "SS & S" (Sambon Stress & Soul pupillometer), which allows to determine the physiological and psychological characteristics of a person based on the analysis of the pupil's reaction to the light flash. 466 students took part in our research: 331 females, 135 males. Pupillometry demonstrated that about 13% of students had intensive, and 11.04% acute pathological fatigue, thus, a fifth of the surveyed needed rest and recovery. 17% of students showed the residual effects of resource loss. About 11-14% of the students had excessive, pathological neuroticism, anxiety, emotional impulsivity and extraversion. The attention switching exceeded the age norm by one third. 13.95% showed extremely fast switching, high distractibility, inability to concentrate on one thing, reduced ability to memorize and remember the information. The results of study show the actual need of psychological support of the education process in higher educational institutions.
O924
SELF-EFFICACY, POSITIVE AFFECT, AND ENTREPRENEURIAL SUCCESS: LONGITUDINAL RELATIONS

D02. Work and organization - Leadership and entrepreneurship

Adam Żaliński, The John Paul II Catholic University of Lublin, Lublin – Poland

One of the goals of scientific studies of entrepreneurship is to uncover the characteristics of processes which power the economic growth. The present study adds to these evidence building on positive psychology and personal resources perspectives. The research aims to reveal reciprocal relationships between positive psychology variables and success in entrepreneurial activity, using longitudinal framework. It tests how work specific self-efficacy, positive affect represented by enthusiasm, and subjective entrepreneurial success reciprocally influence one another. A three-wave longitudinal study was conducted among a group of 209 entrepreneurs who established and run their small or medium sized businesses in Poland. The Polish versions of work-related General Self-Efficacy Scale, Work Related Affect Scale, and Perceived Entrepreneurial Success Scale were used. The findings of structural equation modelling for longitudinal data show that self-efficacy relates positively to positive affect and perceived success in entrepreneurial activity. These variables show complex reciprocal relationships influencing each other over time. The findings demonstrate how positive personal resources are intertwined with business performance.
O925
TELLING CHILDREN THE PARENT'S CANCER: A SPECIFIC INTERVENTION TO ENHANCE COMMUNICATION INSIDE FAMILY

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Francesca Gallina, San Gerardo Hospital, Monza - Italy
Momcilo Jankovic, San Gerardo Hospital, Monza - Italy
Marco Bani, San Gerardo Hospital, Monza - Italy
Marina Elena Cazzaniga, San Gerardo Hospital, Monza - Italy
Lorenzo Tagliabue, San Gerardo Hospital, Monza - Italy
Umberto Mazza, San Gerardo Hospital, Monza - Italy

This presentation describes a multidisciplinary intervention dedicated to patients with cancer and with underage children. It is well known that children of severely ill parents can develop emotional and behavioral problems. Different studies underline the efficacy of an open communication with children about the parents’ illness to reduce distress but also the difficulties of parents to explain it to their children. The project aims to inform or improve the children’s knowledge of their parent’s cancer, facilitate children’s coping with the illness, enhance parents’ competence and communication about cancer inside family. After the fact-finding parents sessions, the pediatric hemato-oncologist and the psychologist, without parents’ presence; explain to children, with the support of metaphors and images, the parent’s cancer and understand their needs or fears. Then counseling sessions to parents are organized to increase the parental competence. It has been realized a specific questionnaire to evaluate the family’s atmosphere and children psychological conditions after the intervention. Actually 28 families have participated in the project. Preliminary quantitative analyses underline the family satisfaction, the absence of severely psychological symptoms in children and the increase of collaboration and communication in the family. Support for open communication in the family about cancer should be acknowledged as an important aspect of oncology care to reduce family stress.
ADJUSTMENT TO RETIREMENT: THE ROLE OF PSYCHOLOGICAL PLANNING AND RETIREMENT RESOURCES

Retirement is a major life event and successful adjustment will provide a nurturing environment for retirees to prepare for a new chapter in late life. With reference to the resource-based dynamic perspective (Wang, Henkens, & van Solinge, 2011), this study examined the relationships among pre-retirement planning, retirement resources, attitudes toward retirement, and perceived adjustment to retirement in a sample of Chinese pre-retirees. Working adults, who would retire from their jobs in the next 6 months, were invited to take part in this study. Preliminary results showed that psychological preparatory behaviors were associated with greater social and mental resources held by the participants. Pre-retirees with richer social and mental resources were more likely to hold positive attitudes toward retirement, and perceive better adjustment to retirement. The mediating role of retirement resources in the relationship between retirement planning and adjustment will be explored and discussed. Findings of this study will provide recommendations to human resources personnel for designing retirement preparation programs.
O930
ASSESSMENT OF RISK FOR HARM TO SELF OR OTHERS FOR PEOPLE WHO ENTER IN PRISON: THE EXPERIENCE AT THE MONZA PRISON

E03. Health and clinical intervention - Personality assessment

Manuela Valsecchi, San Gerardo Hospital, Monza - Italy
Francesca Cova, San Gerardo Hospital, Monza - Italy
Sara Mauri, San Gerardo Hospital, Monza - Italy
Paola Rubelli, San Gerardo Hospital, Monza - Italy
Emanuele Trui, San Gerardo Hospital, Monza - Italy
Federico Zorzi, San Gerardo Hospital, Monza - Italy
Giorgio Rezzonico, University of Milan-Bicocca, Milan - Italy
Umberto Mazza, San Gerardo Hospital, Monza - Italy

At the Monza prison, since September 2012, a clinical assessment’s protocol has been applied to people who enter in prison to prevent harm to self or others. The protocol begins with a clinical session to explore these areas of the J-SAT: juridical situation, history of aggressive acts, psychosocial evaluation, drug assumption, presence of psychiatric disorder, suicide or self-harm risk, presence of anxious and depressive symptomatology. In addition BIS-11 and CORE-OM questionnaires are administered to evaluate impulsiveness and distress’ level. If positive results are detected, the possibility of a psychiatric advice is considered and the prisoner is included in a monitoring and treatment plan, evaluating the development of the clinical conditions. The MCM-III is also administered to investigate the structure and the functioning of personality. CORE-OM re-testing, 3 and 6 months after, is used to evaluate the trend and the results of the intervention. In 24 months, 2356 new prisoners have been evaluated: 91 of them have made self-harm acts for a total of 205 acts and 17 are attempted suicides. Preliminary results confirm the importance of the timeliness of the assessment and the psychological treatment at the beginning of a new or recidivist imprisonment with specific attention to positive results at the CORE-OM: higher distress has been observed in people who made self-harm acts.
O931
WORK ROLE FIT, PSYCHOLOGICAL MEANINGFULNESS AND WORK ENGAGEMENT AMONG MEN AND WOMEN

Madelyn Geldenhuys, University of Johannesburg, Johannesburg - South Africa
Ita Geyser, University of Johannesburg, Johannesburg - South Africa

Orientation: Work role fit can enhance employees’ experience of meaningful work which is crucial in increasing work engagement of employees. Thus, finding a match between the person and the organisation may benefit both employees as well as the organisation. Research purpose: The aim of the study was to investigate the relationships amongst work role fit, psychological meaningfulness and work engagement among men and women and to test for a possible mediating effect of psychological meaningfulness on the relationship between work role fit and work engagement. Motivation for the study: There are increasing numbers of women within the workplace, which impacts the nature of jobs. It is therefore important that managers consider the possibilities with regards to the experiences of psychological meaningfulness based on gender at work and how it may affect the productivity of men and women differently. Research approach, design and method: A quantitative approach was employed to gather the data for the study, utilising a cross-sectional survey design. The sample (men = 188; women = 248) consisted of working employees from various companies and positions in Gauteng, South Africa. Main findings: The results confirmed a positive relationship between work-role fit, psychological meaningfulness and work engagement. Further, work role fit predicts psychological meaningfulness, whilst work role fit and psychological meaningfulness predict work engagement for South African employees. No significant differences were found between men and women on these relationships. Practical/managerial implications: Employees within organisations should be given the opportunity to identify meaningful work experiences as this increases work engagement levels within the organisation. Internal work opportunities which are aligned with employees’ personal values enhances these levels. Contribution/value-add: This research contributes to the sustainability of work engagement by focussing on meaningful work as well as work role fit. This research furthermore adds to the body of knowledge on positive work experiences.
THE CHARACTER STRENGTHS OF OBESE PEOPLE IN SOCIAL PERCEPTION. EMPIRICAL RESEARCH

Obesity is one of the most important health problems worldwide. The prevalence rates of overweight and obese people are increasing by year and the consequences for individuals, societies and economies are severe. Apart from medical issues, there are difficulties with dealing with everyday life challenges, coping with stress or even finding a job. The perception of obesity – as not an illness but often a flaw in the character, an individual’s lack of discipline – leads to the development of different stereotypes and a biased attitude. The ample empirical evidence shows that obese people are often perceived as incompetent, lazy and untrustworthy. Moreover, they are aware of the existing bias and tend to withdraw from certain activities, including participating in social life or even seeking medical assistance. The aim of the presented study was to examine the perception of the character strengths of obese people by different social groups: e.g. students, medical practitioners, psychologists. The survey conducted in Poland, consisted of several assessment methods (e.g. measuring character strengths – own adaptation of Goldberg's International Personality Item Pool – Values in Action Scales). The participants assessed how they perceived obese people and answered questions about several aspects of their own functioning. The results show certain trends among different groups. Thanks to the findings, it will be possible to better understand what can cause the bias and to create a programme aimed at fighting the stereotypes against obese individuals.
The inconsistent Self, having endured emotional traumas far too early in their lives, prove to be of very little cohesion, and of fragile identity. Therefore, persons with little cohesive Self and fragile Self, are also poorly equipped with adequate defenses to cope with the several family, environmental and social difficulties. Their personality is often not completely structured, as it is not their identity, sometimes even the identity of gender. The growth and, in particular, the pubertal phase of development that engages body and mind and the next phase of adolescence, would probably require, for a successful outcome, the presence of a cohesive Self and of an Ego strong enough to withstand the hormonal change and the new psychological needs. The development of severe pathologies during the adolescence is then backed up by personality characteristics corresponding to those of with an inconsistent Self. The development of serious disorders during the adolescence might however be transient, if properly diagnosed and properly treated. It is therefore necessary to establish a precise diagnosis and an appropriate course of treatment, also adopting the new techniques for trauma care; but it is also needed to create new structures, using computer technologies already available to us, which, by means of the quantum physics, are able to provide a quantitative and qualitative analysis of the emotions experienced. Adults too could benefit from such facilities for the care of trauma.
O940
SCHOOL CHILDREN’S FUTURE GOALS REGARDING WORK AND FAMILY

C06. Culture and society - Attitudes and values

Mizuka Ohtaka, Yamanashi Gakuin, University, Kofu – Japan

Work–family conflict, a psychological aspect of work–life balance is divided into two categories: work interfering with family (WIF) and family interfering with work (FIW). Studies indicate that while Americans experience both WIF and FIW equally (Greenhaus, & Powell, 2002), Japanese experience more WIF than FIW (Yamaguchi, 2010). This might be because the Japanese want to place family above work but cannot avoid placing work above family. A survey targeting 1,152 Japanese school children, ‘Monograph school children now, the world of boys, the world of girls, 2004 (Benesse Educational Research & Development Institute)’, reported that 87.1% of the respondents wanted to place family above work in the future. It is worth examining whether these goals are self-concordant (intrinsic and autonomous) or extrinsic. Previous studies have showed that only when goals are self-concordant do they correlate with positive self-evaluation and well-being (Judge, Bono, Erez, & Lockes, 2005; Masuda, & Sortheix, 2012). Therefore, if school children’s goals of placing family above work correlate with positive self-evaluation and well-being, they are intrinsic and autonomous as opposed to being extrinsic. This study examined these correlations by analysing the above-mentioned survey secondarily. The results indicated that school children who evaluated themselves positively and were happy wanted to place family above work in the future. This suggests that their future goals are self-concordant.
O946

PHYSIOLOGICAL MEASURES OF EMOTIONAL PROCESSES WITHIN COUPLE INTERACTION: TOWARDS AN INTERDEPENDENCE PERSPECTIVE

B04. Development and education - Attachment and intimate relationships

Emilie Constan, University of Lille 3, Villeneuve d'Ascq - France
Véronique Christophe, University of Lille 3, Villeneuve d'Ascq – France
François Gabrielli, University of Lille 3, Villeneuve d'Ascq – France
Jean-Louis Nandrino, University of Lille 3, Villeneuve d'Ascq – France

Rational. Intimacy is a “feeling of closeness and connectedness” (Sternberg, 1997) and is described as a transactional process of emotions (Laurenceau et al., 1998). Emotional skills are important in couple functioning (Levenson et al., 1994) and development or maintenance of intimacy (Odegaard, 1996). This research explores emotional abilities that might influence the quality of the relationship by integrating physiological measurement of emotional regulation. Method: Twenty heterosexual couples in a committed relationship completed self-report questionnaires measuring partners’ emotional skills and their perception of intimacy and marital satisfaction. Couples were asked to interact about a disagreement area and, a posteriori, viewed separately the conversation. During this “video-recall” session, physiological measures of emotional processes (electrodermal response and heart rate variability) are recorded. Results: We observe a positive effect of partners’ emotional skills on the abilities to regulate their emotions and the quality of the relationship. In conflict context, patterns of emotional regulation differ between men and women. Discussion: This research allows a better understanding of the emotional regulation process in a context of couple interaction with a combination of subjective and objective measures. Gender differences and interpersonal influence of this process on partners’ intimacy and marital satisfaction will be discussed in the framework of marital therapy.
The legal requirements for traffic psychological assessment stipulate that reliable instruments must be used. Furthermore, international test certification procedures require various test-related quality criteria such as reliability, validity and local norms to be considered. Drive Screening is a test battery consisting of three different driving-related tests that assess obtaining an overview (ATAVT, Adaptive Tachistoscopic Traffic Perception Test), reactive stress tolerance (DT, Determination Test) and reaction time (RT, Reaction Test). DRIVESC is widely used in the assessment of fitness to drive in many different countries. For the Italian version of DRIVESC a representative norm sample was collected in Italy based on the most recent census and stratified by age (M=49.44, SD=18.94) and gender (188 female, 155 male). Reliability was found to be above .8 for all tests. Construct validity was analyzed by various methods, e.g. confirmatory factor analysis. The results confirm the construct validity of DRIVESC. In addition, the Italian norm sample was compared to the norm samples of various European and Asian countries with regard to the above-mentioned quality criteria. The present Italian version of DRIVESC therefore forms an evidence-based and empirically sound foundation for the use of DRIVESC in the assessment of fitness to drive in accordance with the Italian legal requirements.
O948
BOUNDARY ISSUES IN ADDICTION TREATMENT: A PSYCHODYNAMIC REVIEW

Gelena Lazos, Institute of Psychology, Kiev - Ukraine

Addiction has been described as self-medication (Murphy & Khantzian, 1995), transitional object (Johnson, 1998), and ego atrophy (Fine & Juni, 2001) in psychodynamic theory. Psychodynamic theory further holds that the individual with addiction has loose unconscious-conscious boundaries (Thalbourne & Houran, 2000) and that their interpersonal boundaries are either too loose, to the brink of nonexistence, or extremely rigid (Mackensen & Cottone, 1992). The individual’s internal representations of external reality are also distorted, indicting disturbances in the boundary between intrapsychic and interpersonal (McCartney, 1999). Although boundary structures of the addicted individual have been thoroughly studied, psychotherapeutic boundaries within the addiction treatment have been neglected in the literature. This presentation will discuss the psychodynamic frame of addiction treatment in terms of McWilliams’s (2004) framework. More specifically, addiction treatment will be considered in terms of privacy, time, money, availability of the therapist and managing chance encounters.
The study aimed to investigate the relationship of Reassurance Seeking (RS) with OC symptoms and related emotions. Reassurance Seeking Questionnaire, Obsessive-Compulsive Inventory, Trait Anger Expression Inventory, Guilt Inventory, and Disgust Scale were administered to 403 university students and 110 adults. Multiple regression analysis revealed that Source and Carefulness scores positively related to guilt, anger and disgust, meaning that the more frequently the participants seek reassurance from a range of sources, and the more careful participants become when they are seeking reassurance, the more they feel guilty, angry and disgusted. On the other hand, Trust scores negatively related to guilt and anger. The more the participants trust a range of information sources, the less they feel guilty and angry. The Intensity scores positively related to anger and disgust. When the intensity of the RS increases, the participants feel more angry and disgusted. Moreover checking, washing and neutralization scores negatively related to Trust scores. Participants' trust to a range of information sources decreases when these type of symptoms increase. Obsession scores positively related to Intensity and Carefulness scores. The intensity of the RS and the carefulness of the participants when they are seeking reassurance increase as the obsessions of participants increase. Examining the association of RS with emotions and OC symptoms would be important to understand OCD maintenance.
HOW LITHUANIAN JOURNALISTS REPORT ON SUICIDE: A QUALITATIVE STUDY

C09. Culture and society - Media and communication

Jonas Eimontas, Vilnius University, Vilnius - Lithuania
Danutė Gailienė, Vilnius University, Vilnius - Lithuania

Lithuania has one of the highest suicide rates in the world. Scientists have demonstrated that the inappropriate media portrayal of suicide can lead to imitative suicidal behavior. Studies from around the world show that there are several factors that contribute to the way reporters use and appreciate the guideliness for reporting on suicide. The purpose of this study was to explore the attitudes on reporting suicide of Lithuanian journalists. Methods. The total of 12 journalists who reported most about suicide in the years of 2010 – 2011 participated in the study. Semi-structured interviews were conducted. A thematic analysis was used to examine the data gathered during the interviews. Results. The thematic analysis of the interviews with journalists has revealed at least five factors influencing how journalists report on suicide: personal characteristics of a journalist, journalists’ experience with suicide, knowledge about suicide, attitudes towards suicide, as well as guidelines and external influences (such as the editor, or the policy of the editorial office). One third of the participants were not familiar with psychological guideliness for reporting on suicide.

FEEDING THE BOUNDERIES FOR INNOVATIVE SCIENTIFIC ORGANIZATIONS

D08. Work and organization - Innovation management
Giuseppe Scaratti, Catholic University of Milan, Milan - Italy
Silvia Ivaldi, Catholic University of Milan, Milan - Italy

The paper explores new ways of scientific communication aimed at promoting reflection and participation of different players (academics, professionals, students...). Following the consolidated theoretical framework of community of practice (Wenger, 1998; 2000), the contribution describes a digital platform named DigitalKBC (Knowledge boundaries crossing) aimed at creating a space of exchange and interaction between multiple and diverse social actors that are linked by the production of sensible knowledge. This knowledge is oriented to provide answers by putting back together: the research with the sense, the knowledge with the meanings that people give to their contexts, the rigor with the relevance. The lever is the collaboration between different players, in order to create opportunities for collaboration and boost knowledge capital for the scientific world. The contribution describes an innovative way of communication among users, that is called ‘tweep’. The term derives from the merge between two worlds that are tweet and paper and that represents a type of contribution more elaborate than a tweet but less demanding and more interactive than a scientific paper. The paper presents how these kind of insight is useful to produce potential ideas, proposals and initiatives related to knowledge in different fields. The conclusions discuss limits and potential of this kind of scientific communication and its impact on social and knowledge capital and creation of communities.
THE DEVELOPMENT AND FURTHER REFINEMENT OF AN INNOVATION LEADERSHIP QUESTIONNAIRE

An Innovation Leadership Questionnaire (ILQ) was developed with the intention to predict the effectiveness of the team leader with regard to leading the team through the different stages in the innovation process. The items generated for the ILQ were submitted to subject matter experts for an evaluation of the content validity of the items, which led to adjustments to some items in the experimental version. During the next phase, ratings from 73 innovative work teams from 9 different organisations in South Africa, incorporating team leaders and their direct subordinates, were collected, resulting in a sample size of 335. Self-ratings by team leaders, as well as ratings by team members of their team leaders, were collected with regard to the innovative competencies of the team leaders, the creative team climate that they have facilitated, and the perceived innovative outcomes of each team. The psychometric evaluation of the questionnaire revealed Cronbach alphas ranging from 0.78 to 0.94 for the various innovation competencies, whilst an alpha of .98 was reported for the total scale. The ILQ correlated well with the conduciveness of the creative climate, as well as with the level of perceived innovativeness of the team. An exploratory factor analysis of the ILQ revealed two unique factors, namely the development of the creative concept and the commercialisation of the concept. A shortened version of the ILQ is proposed on the basis of the factor loadings.
TELEPHONE COACHING IN DIALECTICAL BEHAVIOUR THERAPY FOR SUICIDAL ADOLESCENTS AND THEIR FAMILIES

Kirsten Davis, Kari Centre, Auckland District Health Board, Auckland - New Zealand
Emily Cooney, Kari Centre, Auckland District Health Board, Auckland - New Zealand
Pania Thompson, Clinical Advisory Services Aotearoa, Auckland - New Zealand
Julie Wharewera-Mika, Whirinaki, Counties Manukau District Health Board, Auckland - New Zealand
Joanna Stewart, University of Auckland, Auckland - New Zealand
Ben Te Maro, Kari Centre, Auckland District Health Board, Auckland - New Zealand
Joanna Appleby, Kari Centre, Auckland District Health Board, Auckland - New Zealand

Dialectical Behaviour Therapy (DBT) is an intensive outpatient treatment with strong evidence in treating adults with suicidal behaviour and borderline personality disorder. Since 2000, DBT has been applied to emotionally dysregulated and self-harming adolescents and shows promise with this population (Rathus & Miller, 2002; Mehlum et al., 2014). For adolescents and parents, outpatient DBT is typically comprised of weekly individual therapy, weekly skills training (provided in multi-family groups), family sessions and telephone coaching as needed. The primary function of telephone coaching is to promote skills generalisation. Telephone coaching in research trials has typically been provided by individual therapists on a 24/7 basis, however burden related to phone contact out of hours is a frequent concern in services (Nadoort et al., 2009). This presentation describes the implementation of telephone coaching in DBT for suicidal adolescents and their parents in two outpatient child and adolescent mental health services: (1) via the individual therapist within a randomised-controlled feasibility trial comparing DBT with usual care; and (2) via a rostered DBT consultation team member within a standard DBT programme. The results indicated that adolescents and their parents found telephone coaching helpful in both contexts and therapist burnout before and after implementation remained within normative levels. The implications of this finding are discussed with respect to future research.
O963
COMPARING EMOTIONAL COORDINATION IN SPONTANEOUS MOTHER-INFANT AND FATHER-INFANT INTERACTIONS

A11. General issues and basic processes - Motivation and emotion

Theano Kokkinaki, University of Crete, Rethymnon - Greece

We aimed to compare emotional coordination in spontaneous dyadic infant-mother and infant-father interactions in families in Crete. This comparison is important because: a) the evidence that women have stronger awareness of and responsiveness to emotional expressions may be countered by the evidence that men have a tendency to be more physiologically reactive to emotional expressions of others; and b) the experience of emotional coordination generates affective states in development of infants and children with long-term consequences for the way that the affected individual functions socially, particularly if strongly moving experiences occur during the early period of rapid brain maturation in infancy. Eleven infant-mother and infant-father dyads were video-recorded at home in familiar interactions from the 2nd to the 6th month. Emotional coordination was evaluated with two measures: a) emotional matching, where one partner expresses the facial expression of emotion of the other partner; and b) emotional attunement, where one individual matches the shifts of emotional intensity of the partner. Microanalysis of infant, maternal and paternal facial expressions of emotion provided evidence of quantitative differences that favour father-infant interaction as more playful, but the infant’s behaviours with mothers and fathers show similar non-linear developmental curves. These results are discussed in the frame of the theory of innate intersubjectivity.
The present research has been conducted with the aim of determining the mediatory role of core-self evaluation in the relationship between organizational supports (Colleague and supervisor support) and work-family balance. The research methodology was of descriptive and correlational type. The study population comprised all employees in a governmental organization in Isfahan working there in the year 1392 (2013-2014). Using stratified random sampling, a number of 150 employees were selected from the study population. The research tools included Questionnaire of Work-Family Balance (Carlson et al. 2009), Colleague Support Measure (O’Driscoll et al., 2004), Survey of Perceived supervisor support (Rhoades & Eisenberger, 2000) and Core-Self Evaluation Scale (Judge et al, 2003) that the psychometric features of which were obtained as desired. To analyze the research data, were examined using structural equation modeling (SEM). The results showed that direct effect of colleague support on work-family balance is not significant but direct effect of supervisor support have been significant (p<0.05). Core-self evaluation plays complete mediatory role in the relationship between work-family balance and Colleague support, while this variable is not effect in the relationship between work-family balance and supervisor support.
It is widely accepted that physiological aging is a dynamic process and that cognitive and brain reserves act as protective factors against cognitive decline. The re-activation of networks mediating cognitive functions by cognitive and electrophysiological interventions may then lead to an improvement of functional profile. The research aims at investigating the efficacy of a prefrontal transcranial Direct Current Stimulation protocol (tDCS) and a computerized cognitive protocol (Cogn) in empowering cognitive functions and automatic attention responses in healthy elderly people. Thirty-two volunteers took part to the study and were divided into the tDCS, Cogn or control group. The experimental design included an initial assessment session (T0) and a 3-months re-test (T1), with standardized neuropsychological tests and Event-Related Potentials (ERPs) recording. Both intervention protocols lasted 8 weeks and included 3 sessions per week. Comparison of T0 and T1 data highlighted an increasing profile for specific post-intervention performances at neuropsychological tests in tDCS and Cogn groups. In addition, we also observed a modulation of ERPs responses to a challenging attention task. Finally, participants qualitatively reported subjective increases in everyday functioning. Our findings suggest that structured intervention protocols may help in empowering cognitive abilities in healthy aging people and hint at interesting implication for prevention and early intervention.

CONSCIOUS PERCEPTION OF VIBRATION-INDUCED MOVEMENT ILLUSIONS: PSYCHOPHYSICAL AND SOURCE LOCALIZATION EVIDENCES

A07. General issues and basic processes - Sensation, perception and space

Davide Crivelli, Catholic University of Milan, Milan - Italy
Marco Bove, University of Genua, Genua - Italy
Michela Balconi, Catholic University of Milan, Milan - Italy

Tendon vibration is known to induce vivid movement illusions by activating muscle spindles and generating perceptions of limb displacement. Neuroimaging studies suggest that a sensorimotor network mediate the phenomenon, but its functional and psychophysical correlates are understudied. This study aims at qualifying conscious perception of motor illusions across the electrophysiological and psychophysical levels. Fifteen volunteers took part to the study. Electroencephalogram (EEG) has been recorded while vibratory stimulations were applied to flexor tendons of the right forearm. Participants were asked to report whether they felt their hand moving and to qualify those perceptions (strength and duration). Source localization (sLORETA) has been performed on EEG frequency data. At the electrophysiological level, we observed the activation of a frontal-parietal network (decrease of neural oscillations, i.e. upper-alpha) while participants consciously reported motor illusions, with the insular and premotor cortices as main signal generators. At the psychophysical level, illusions showed a complex but consistent profile. Finally, across-levels analyses suggested that superior parietal activity plays an important role in actually experiencing illusions, it being associated to their frequency. The consonance between psychophysical and electrophysiological data suggests that pre-/post-central structures play different roles in defining conscious feeling of movement, even if illusory.
METHODOLOGICAL ISSUES IN PERSONALITY ASSESSMENT: A POTENTIAL RISK OF APPLYING EXTREMELY BRIEF INSTRUMENTS

Big Five personality trait model is widely acknowledged and regularly used among researchers to account for individual differences in various research questions. However, it is often difficult to use a long and time consuming questionnaire in large scale studies including hundreds of participants. Therefore, shorter questionnaires are highly attractive tools in population or representative studies. As the demand for super-short measures has been continually growing, the Big Five Inventory (John & Srivastava, 1999) was abbreviated to a 10-item scale (BFI-10) as an adequate tool for personality assessment, possessing acceptable psychometric properties (Rammstedt & John, 2007). Lithuanian version of BFI-10 was administered in a recent Lithuania representative study (N = 600). Results indicated that Lithuanian version of BFI-10 failed to achieve adequate internal consistency reliability on all 5 subscales: extraversion $\alpha = .06$, agreeableness $\alpha = .23$, conscientiousness $\alpha = .42$, neuroticism $\alpha = .42$, openness $\alpha = .48$. Although, a factor structure analysis indicated 5 factors, the distribution of items among those factors was rather different from the originally proposed. Hence, we discuss the potential risks of using extremely brief instruments for personality assessments and address researchers not to underestimate the importance of possible cultural differences. This research is funded by the European Social Fund under the Global Grant measure (no. VP1-3.1ŠMM-07-K-02-023).

TRAUMA PREVALENCE IN A REPRESENTATIVE STUDY OF THREE ADULT GENERATIONS IN LITHUANIA

E14. Health and clinical intervention - Disaster and crisis psychology

Egle Mazulyte, Vilnius University, Vilnius - Lithuania
Monika Skeryte-Kazlauskiene, Vilnius University, Vilnius – Lithuania
Jonas Eimontas, Vilnius University, Vilnius – Lithuania
Neringa Grigutyte, Vilnius University, Vilnius – Lithuania
Danutė Gailienė, Vilnius University, Vilnius – Lithuania

Epidemiological studies on trauma exposure and posttraumatic stress disorder (PTSD) indicate that the vast majority of people experience at least one potentially traumatic event in their lifetime; however, only few of them develop clinically significant PTSD symptoms. Up till now there have been no epidemiological trauma exposure studies in Lithuania. A recent representative study of three adult generations in Lithuania is a first large scale study providing an opportunity to evaluate trauma prevalence rates in Lithuanian adult population. In total, 600 Lithuanian citizens participated in this study (200 in each age group). Trauma experience was assessed by the Lithuanian versions of Life Events Checklist (LEC) and Trauma Screening Questionnaire (TSQ). Results of this study showed that 93% of participants were exposed to at least one traumatic event, there were no significant differences between the three age groups. Up to 11% of participants experienced clinically significant PTSD symptoms (7% of those exposed to traumatic events); again there were no significant differences between the generations. We have also found a significant relationship between the number of potentially traumatic events experienced and the symptom severity of PTSD, r = .13, p = .014. The results are similar to those reported in other European countries. This research is funded by the European Social Fund under the Global Grant measure (no. VP1-3.1ŠMM-07-K-02-023).
The link between the use of the New Technologies (NTs) and Quality of Life (QoL) has been argued yet because the NTs are not, per se, a right and plain tool to improve elderly people’s QoL. Two studies were conducted to investigate whether elderly people’s QoL was influenced by higher beliefs Self-Efficacy and positive attitudes towards the NTs. Elderly were approached individually while they frequented a seniors’ centre or lived in seniors’ houses, respectively. Study 1 involved 107 healthy seniors. The data showed positive levels of perceived QoL. Self-Efficacy was high, which indicated our elderly felt fairly self-efficacious in coping with both positive and especially negative emotions. The latter is particularly important: thus being or feeling good at overcoming a prospective frustration may represent an important ability to keep trying instead of renouncing and feeling incapable. The elderly did not feel anxious about the use of the NTs but they did not take a clear position probably because they did not know very well this kind of tools. Regression analysis showed the QoL was affected by self-efficacy beliefs and more favourable attitudes towards the NTs. We replicated the same study involving 164 elderly who suffered from some illness. Even this time, QoL was influenced by self-efficacy and attitude towards the NTs. The two studies represent the first step of an Action Research that will start in autumn and involve some of our participants.
O983

HIGH AND LOW PERCEPTUAL SALIENCY AND ATTENTION RESTORATION EFFECTS WITH NATURAL AND BUILT SCENES

A08. General issues and basic processes - Attention and consciousness

David Pearson, University of Aberdeen, Aberdeen - United Kingdom
Tony Craig, The James Hutton Institute, Aberdeen - United Kingdom

Attention Restoration Theory (ART) claims that built scene content places greater demands on directed attentional resources than natural scene content. Built environments have an excess of bottom-up stimulation that dramatically captures attention (described as hard fascination), while natural scene content automatically captures attention (described as soft fascination). Here we propose the perceptual saliency of scene content can be used as an empirically-derived indicator of the level of “fascination” afforded by an environment. Using a laboratory-based paradigm cognitive fatigue was induced in participants by asking them to complete a backwards digit span task, following by viewing a slideshow depicting photographs of natural or built scene content. A between-participants design was employed with four conditions: natural scenes with high or low saliency, and built scenes with high or low saliency. Saliency levels were empirically derived from a previous study. Cognitive restoration was determined by comparing backwards digit span performance before and after viewing the slideshow. The results demonstrate a main effect of the saliency level on restoration that is separable from an effect of natural/built scene category. These results are discussed in relation to ART and other theories of psychological restoration. It is concluded that the saliency level of scene content can function as an important indicator of cognitive restoration effects.
THE ASSESSMENT OF SLEEP DISORDERS AND DEPRESSION IN PATIENTS SUFFERING FROM CHRONIC RENAL FAILURE IN PUBLIC HOSPITALS SHIRAZ UNIVERSITY OF MEDICAL SCIENCES

E18. Health and clinical intervention - Psychosomatics and clinical psychophysiology

Fatemeh Azadian, Islamic Azad University, Shiraz University of Medical Sciences, Arsenjan, Shiraz - Iran
Leila Malek Makan, Shiraz University of Medical Sciences, Shiraz - Iran
Ali Naseri, Islamic Azad University, Arsenjan - Iran
Mahboobeh Chin Aveh, Islamic Azad University, Arsenjan - Iran

Chronic renal failure is one of the major threats of world public health. This is a pathophysiological process due to a variety of causes. If not cured, it lead to the inevitable decline in the number of nephrons and their function which eventually leads of renal failure. This is one of the common diseases of the modern age. This study aimed to asses sleep disorder and depression in patients suffering from chronic renal failure in Shiraz. Thesis a descriptive- cross sectional study with random sampling. Considering is error and 8% (power), a sample size of 144 patients was estimated. Date collection was done through sleep disorders questionnaire (PSQ1) and Hamilton Depresses questionnaire. The data were entered in spss-19 and descriptive test, ANOVA and post Hoc were and to among the at 5% level. Patent’s (45.5%) were Dialysis patients and 56 patents (45.1%) were peritoneal dialysis patients whose mean age was 54.4%± 11.8 and the age range was 24 to 80. 77 patients (54.6%) suffer from sleep disorders. Total sleep score in hemodialysis patients compared with peritoneal dialysis patients showed statistically significant difference. 74.8% of the patients participating in this study had some degree of depression. Based on the findings, the prevalence of sleep disorders in patients under hemodialysis and peritoneal dialysis was high which could threaten patients physical and mental health. So its important to screen every six mouths and counseling centers for these patient’s. Keywords: Sleep disorder, Depression, chronic renal failure
DOES MINDFUL FAMILY TIME HELP YOU DETACH FROM WORK?:
WORK-RELATED RUMINATION AND SUBJECTIVE FAMILY VALUE IN
JAPAN AND ITALY

C02. Culture and society - Family systems and processes

Miyuki Katayama, Tokyo University, Tokyo – Japan

The question of this study is what factors help people psychologically detach from work and decrease work-related rumination. It has been revealed that mindfulness or activities outside of work such as physical exercise and volunteer work are effective factors. However, effect of quality of family time on detachment has not been examined in detail, despite its importance and the considerable amount of time people spend with their family in a day. As an index, work-related rumination is critical for measuring the failure to detach from work. Rumination is also important as it is a risk factor for depression in adults and adolescents. Participants of the online survey were 941 married, employed adults with one or more children under the age of 10 years in Italy and Japan. The data showed, in one culture, mindful family time helped in detaching from work and decreasing rumination, whereas in another culture, that same type of family time was ineffective. For example, Japanese women’s sense of fulfillment in just viewing their own children decreased rumination, where Italian men and women decreased rumination if they cook at home by themselves. Mindful child care in Japan or mindful cooking in Italy might be an effective way of intervention. Other point of view, such as social connectedness, mastery experience, and self-efficacy, will be discussed specifically with the data of Italian women. In 2015 next research in Germany, the United States, and France will be conducted.
O992

INDIVIDUAL DIFFERENCES AND STRESS REDUCTION IN URBAN GREEN AREAS

F19. EXPO 2015 Hot Topics - Life skills in culture and society

Ann Ojala, Finnish Forest Research Institute (Metla), Vantaa – Finland
Kalevi Korpela, University of Tampere, Tampere – Finland
Liisa Tyrväinen, Finnish Forest Research Institute (Metla), Vantaa – Finland

Urbanisation is a challenge for city planners and policy makers – how to build cities that would support human health and well-being. Previous research has indicated that urban green areas have potential to improve psychological well-being. There is strong evidence that visiting nature and being in nature helps to recover from stress. However, we know little about the effects of individual differences on stress reduction in different urban environments. This presentation is about how urban orientedness, subjective health estimation and noise sensitivity affect stress reduction in constructed urban park, urban woodland and city centre of Helsinki, the capital city of Finland. The participants, 30-61 years old healthy women (N=83), visited the study sights in a group of maximum four people. The experiment consisted of a 15-minutes viewing session which was followed by a 30-minute walking session on a given course. We used several psychological measures for stress reduction like the Restoration Outcome Scale and Subjective Vitality Scale. The measurements were done at the beginning of the experiment, after viewing and after walking. The data were analysed in SAS, using mixed method model. The effects of individual differences in stress reduction will be discussed. Developing an understanding of such differences and supporting mechanisms will contribute to the development of further studies as well as to optimise the implications for city-planners.
O993
MEANING AND MEASUREMENT OF PSYCHOPATHY: A MIXED METHODS INVESTIGATION

A14. General issues and basic processes - Personality

William Spangler, State University of New York, Vestal - United States
Minyoung Cheong, State University of New York, Vestal - United States
Jayoung Kim, State University of New York, Vestal - United States
Jiangang Huang, State University of New York, Vestal - United States
Kristin Lee Sotak, State University of New York, Vestal - United States

The purpose of this presentation is to summarize the results of a three-study mixed methods investigation of the meaning and measurement of psychopathy. Psychopathy is a personality disposition characterized by anti-social behavior, sensation seeking, lack of empathy, and lack of concern for consequences. A number of issues confront psychopathy researchers including: (1) the meaning of the construct, (2) lack of implicit measures of empathy, (3) measurement of psychopathy as part of a single dimension with psychopathy at one end and empathy at the other, and (4) a failure to study psychopathy separately in men and women. The present investigation consists of three studies. In the first study, we use qualitative and exploratory quantitative methods to explore the meaning of psychopathy. We develop and validate computerized content analysis dictionaries to measure psychopathy of men and women from Thematic Apperception Test (TAT) stories. We cross-validate the dictionaries in a second separate sample. The third study is a deductive evaluation of these dictionaries using another sample of data. Traditionally researchers have used primarily either qualitative or quantitative methods. Mixed Methods Research is a third wave or a paradigm that capitalizes on the strengths of qualitative and quantitative techniques. We use this new paradigm to study four issues that confront psychopathy research.
O994
MODERATING EFFECTS OF PERFECTIONISM IN THE RELATIONSHIP BETWEEN NEGATIVE MOOD REGULATION AND DEPRESSION

A14. General issues and basic processes – Personality

Presenter: Ayse Altan Atalay, Yeditepe University, Istanbul - Turkey
Dilek Sarıtaş Atalar, Ankara University, Ankara - Turkey
Negative mood regulation expectancies or individual’s beliefs in their ability to regulate their negative emotions can be beneficial in coping with difficult situation and thus documented to be closely linked with depression, and anxiety. The present study aims to investigate the moderating role of perfectionism, a personality trait that is characterized by a tendency to set high standards for the self, being preoccupied with making mistakes, and being dissatisfied with the accomplishments, on the association of negative mood regulation expectancies with worry, anxiety and depression. 326 university students who participated in the study completed questionnaires that assess levels of depression, trait anxiety, worry, negative mood regulation, and perfectionism. Both negative mood regulation expectancies and perfectionism were able to significantly predict the changes taking place in anxiety, depression and worry levels. Moreover, interaction of mood regulation with perfectionism was found to further boost the prediction of depressive symptoms. The same moderation effect of perfectionism was not found for the relationship of negative mood regulation with trait anxiety and worry. Some implications of the present study are discussed.
O995
LANGUAGE BROKERING: RETROSPECTIVE PERCEPTIONS OF FULFILMENT AND BURDEN

C02. Culture and society - Family systems and processes

Renu Narchal, University of Western Sydney, Penrith - Australia
Sharon Cashel, University of Western Sydney, Penrith – Australia

Children and youth of migrant parents that translate and interpret for their families in the process of acculturation, contribute immensely toward their settlement in the host culture. They are referred to as language brokers. Research regarding the impact of language brokering divulges mixed results, suggesting the role to be beneficial or detrimental for wellbeing of language brokers. Following Wu and Kim (2009), this retrospective study investigated changes in family systems and processes; extent and perceptions toward brokering as a sense of fulfillment and burden and its consequences for psychological wellbeing of language brokers. Data was collected online from 119 participants, (96 females & 22 males; Mage = 23.10, SD = 8.39) from culturally and linguistically diverse backgrounds. Thematic analysis revealed 4 key themes when language brokering was perceived by participants to be fulfilling: (a) providing a safe haven for the family; (b) acting as linking pins; (c) situations that enhanced self-esteem and, (d) ability to help others in need. Themes that expressed language brokering as a burden were: (a) need to sacrifice or delay gratification; (b) lack of confidence in capabilities; (c) communicating unpleasant information, and (d) placed in embarrassing situations. Given the extent of language brokering and the scant empirical attention within Australian context, findings highlight the significance of appropriate supports and services for language brokers’ wellbeing.
RELATIONSHIPS BETWEEN WELL-BEING AND POST-AWAKENING CORTISOL: THE IMPORTANCE OF ELECTRONIC MONITORING TO THE SALIVA SAMPLING PROTOCOL

A04. General issues and basic processes - Psychobiology

Nina Smyth, University of Westminster, London - United Kingdom
Phil Evans, University of Westminster, London - United Kingdom
Lisa Thorn, University of Westminster, London - United Kingdom
Frank Hucklebridge, University of Westminster, London - United Kingdom
Angela Clow, University of Westminster, London - United Kingdom

Post-awakening cortisol secretion in the first 30-45 minutes (PACS), which includes the cortisol awakening response (CAR) and overall cortisol concentrations (area under the curve with reference to ground: AUCg), is commonly investigated in relation to psychosocial variables. Although sampling within the domestic setting is ecologically valid, participant non-adherence to the protocol results in erroneous measurement of PACS, which may explain discrepancies in the literature linking cortisol measures to well-being. Delays of just 8 min (between awakening and sampling) result in erroneous CAR estimates. For the first time we show the impact of electronically-monitored sampling accuracy on the relationships between PACS and well-being. Healthy females (N = 49, 20±2.1y) differing on trait well-being (TWB) collected saliva samples on 4 days at 0, 15, 30, 45 min post-awakening. Participant adherence was verified by electronic estimates of awakening (actigraphy) and sampling times (track caps). A negative relationship was observed between AUCg and TWB, but only for those participants who sampled accurately (i.e. less than 5 min delay between awakening and sampling). There was no association between TWB and the CAR regardless of sampling accuracy. These results highlight the importance of electronic monitoring of participant adherence for measurement of PACS in the domestic setting and also showed a dissociation between two measures of PACS in terms of the relationship with TWB.
It can be a difficult time for the family when parents separate and a major stressor for children, which can be exaggerated, when parents are unable to make a shared decision on the future care of their children. In the United Kingdom, the Children and Family Court Advisory and Support Service help parents through discussions and workshops to tackle conflicts and achieve an out-of-court settlement. This presentation is an evaluation of four parenting programmes delivered to reduce the time taken for parents to come to a shared resolution over their child’s future. The programmes were Caring Dads, Positive Mums, Surviving Relationship Breakdown and Anger Management. A mixed-method design was used with 60 cases of parents in the intervention group compared to 25 cases in a control group of parents who were offered a programme but declined to take part. The time taken to resolution was compared between both groups. Also, parents completed pre- and post-intervention surveys and facilitators completed an open-ended survey. The results showed that 36 (63%) out of the 60 cases in the intervention group had closed cases at the end of the intervention period compared to 11 (44%) out of the 24 cases in the control group. Individually each parenting programme reduced parental conflict and enhanced parents’ ability to communicate effectively with each other. Future research should explore the referral process to these programmes and to hear the voice of the children involved.

TEAM REGULATORY FOCUS, TEAM AFFECT TONE AND TEAM PERFORMANCE: THE MODERATING ROLE OF TRANSFORMATIONAL LEADERSHIP

D03. Work and organization - Teams performance
Chiung-Yi Huang, Yuan Ze University, Taoyuan - Taiwan, Province of China
Jia-Chi Huang, National ChengChi University, Taipei - Taiwan, Province of China

Team regulatory focus, team affect tone and team performance: The moderating role of transformational leadership: The purpose of this study is to explore how team affect tone mediates the relationship between team regulatory focus and team performance, and propose a moderated-mediation model about how transformational leadership moderates the indirect relationship that team regulatory focus with performance via team affect tone. The past decade has seen increasing interest in the role of regulatory focus in the workplace, particularly about to explore the mediating mechanism to elaborate the model of how regulatory focus relates to performance. These mediating roles were punctuated by a several advances, such as self-efficacy (Wood & Bandura, 1989), and goal setting (Leonardelli, Lakin, & Arkin, 2007). However, some scholars recently argue that it is one of the most prominent gaps in our understanding of the relationship between regulatory focus and mood states (Higgins, 2006). Furthermore, the relationship between leadership and emotion is also limited to understand (George, 2000; Muchinsky, 2000; Ashkanasy, Härterl, & Daus, 2002,). Alongside the burgeoning interest in emotions, there is an explosion of interest on the topics of teamwork and team leadership in the past decade. Hence, this article integrates these important research areas by investigating the relationship between team regulatory focus, team affect tone and team leadership, and proposes a moderated-mediation model to explore these predictors that would finally influence team performance. Team Regulatory focus, Team Affect Tone and Team Performance: According to regulatory theory (Higgins, 1997; Idson, Liberman, & Higgins, 2000), self-regulatory can be distinguished between promotion focus and prevention focus. Promotion focus originates from the survival need for nurturance; self-regulation is concerned with aspirations and accomplishments as desired end states and yields sensitivity to the presence or absence of positive outcomes, with behavioral approach as the natural strategy to goal attainment. Prevention focus, in contrast, originates from the survival need for security; it involves responsibilities and safety as desired end states and yields sensitivity to the presence or absence of negative outcomes, with behavioral avoidance as the strategic means to goal attainment. In addition to desired goal, strategy, and behavioral approach, these two regulatory focuses also linked to mood and emotion states (Higgins, 2006). According to previous research, promotion focus is closely related to approach tendency and prevention focus is closely related to avoidance tendency (e.g., Shah, Higgins, & Friedman, 1998; see also Friedman & Förster, 2000, 2002). There are strong evidences for a link between specific mood states and approach and avoidance tendencies. For examples, Frijda et al. (1989) found that fear and anxiety, as well as disgust and aversion, were associated with the action tendency of avoidance. Enthusiasm, joy, and happiness (among others) were associated with approach tendencies. Other research also suggested that promotion focus is related to positive affect and prevention focus is related to negative affect (Sassenberg & Hansen, 2007; Bass, De Dreu, & Nijstad, 2008; Lanaj, Chang, & Johnson, 2012; Gorman, Meriac, Overstreet, Apodaca, McIntyre, & Godbey, 2012). From activating perspectives (Bass et al., 2008), individuals with high level prevention focus tend to view situation in a pessimistic way. They concern with non-loss to push them sensitivity on punishments and loss cues, and it would activate them approaching to negative emotion. On the other hand, individuals with high level promotion focus tend to view situation in an optimistic way. They concern with gain to push them sensitivity on win and achievement cues, and it would activate them approaching to positive emotion. Extending the above statements to team level, the study proposed that team promotion focus is positive related to positive affect tone (H1a), and team prevention focus is positive related to negative affect tone (H1b). Furthermore, we also examine the mediating role of team affect tone in the relationship between team regulatory focus and team performance. This study propose that team
promotion focus has an indirect positive relationship with team performance via team positive affect tone (H2a), and team prevention focus has an indirect negative relationship with team performance via team negative affect tone (H2b). Moderating Role of Transformational Leadership: Leadership plays an important role for team and team members. Among many leadership theories, transformational leadership is predominantly discussed in recent researches. Lots of studies explored the transformational leadership in teams from different perspectives, but they mainly focus on direct effect of transformational leadership on various outcomes (Arnold, Barling, & Kelloway, 2001; Jung & Sosik, 2002; Lim & Ployhart, 2004; Keller, 2006; Schaubroeck, Lam, & Cha, 2007). This study stands on situational role of transformational leadership in teams, and proposes a moderated-mediation model to investigate the moderating role of transformational leadership in the indirect relationship between team regulatory focus, team affect tone, and team performance. We proposes that transformational leadership positively moderates the indirect relationship that team promotion focus with team performance via team positive affect tone, in that the indirect relationship is stronger when transformational leadership is higher (H3a), and transformational leadership negatively moderates the indirect relationship that team prevention focus with team performance via team negative affect tone, in that the indirect relationship is weaker when transformational leadership is higher (H3b).

Methods and Results: To test our hypothesis, we conducted a survey of a sample of research and development teams in Taiwan. We began the survey by contacting the human resource management department of large corporations and sought approval for R&D teams to participate in our survey. To avoid common method variance, we distinguished the survey into team member and team leader questionnaires, differentiated by colors. Team member questionnaires evaluated regulatory focus, team affect tone, transformational leadership and individual demographic data, while the team leader evaluated team performance and the team’s basic information. Final valid samples are 248 participants in 58 teams. We used hierarchical regression analysis to test H1 and H2, with team size and team members’ average tenure with teams as control variables. Results showed that team promotion focus is positively related to positive affect tone, and team prevention focus is positively related to negative affect tone, supporting H1a and H1b. We also found that team prevention focus has an indirect negative relationship with team performance via team negative affect tone, supporting H2b. Team promotion focus has indirect effect on team performance. H2a was also supported. Furthermore, following Edwards and Lambert’s (2007) suggesting procedure, we tested the moderated-mediation model of H3a and H3b. Results revealed that transformational leadership negatively moderated the indirect relationship in team prevention focus on team performance via team negative affect tone. The indirect relationship is weaker when transformational leadership is higher. H3b was supported. While the moderating effect of transformational leadership on the indirect relationship between team promotion focus, positive affect tone and team performance was not significant. H3a was not supported. Conclusion and Contribution: Associating mood states with a specific regulatory focus is a relatively new development in the literature on moods and emotions, and direct evidence for such associations is still rare (Bass et al., 2008; Gorman et al., 2012). In this study, we found that team promotion focus and team prevention focus has indirect relationship with team performance through the mediating effect of positive team affect tone and negative team affect tone, respectively. We also found the moderating role of transformational leadership on the indirect relationship between team prevention focus, team negative affect tone and team performance. This study links the relationship between regulatory focus and emotions with extensions to the team level to release the black box. We believe this research contribute to literatures in both regulatory focus and emotions theories.
“I NEED TO TURN MY ANXIETY IN AN ACT AS CONFIDENT AS POSSIBLE”. EMOTIONAL EXPERIENCE OF SURGEONS’ EVERYDAY PRACTICE: QUALITATIVE STUDY

D04. Work and organization - Well-being at work

Massimiliano Orri, University Paris Sud and University Paris Descartes, Paris - France
Anne Revah-Levy, Centre Hospitalier d'Argenteuil, Argenteuil – France
Olivier Farges, Hopital Beaujon, Clichy – France

Background. Physicians’ emotions felt during the care of seriously ill patients affect both physicians’ practice and wellbeing, especially if they are overlooked. Objective. Explore the emotional experience of surgeons practicing high-risk interventions. Methods. Qualitative study involving 27 purposive selected liver surgeons from 10 teaching hospitals (23 male, 4 female). Inclusion proceeded until data saturation being reached. Data were collected through individual interviews, and thematically analyzed by 3 researchers.

Results. 7 themes emerged, categorized in 3 main themes: Before surgery: emotions in the preoperative period, including the themes (i) Emotional issues of preoperative consultation, and (ii) Concerns about possible complications; During surgery: emotions in the operative period, including the themes (iii) Distancing themselves from emotions: surgery as a technical act (iv) Distancing themselves from emotions: surgery as a technical act, and (v) Distress caused by time management and fatigue; After surgery: emotions during the postoperative period, including the themes (vi) Repercussions of operative complications, and (vii) Pressures of the surgical model. Conclusions. All surgeons’ experience is dominated by important emotions, which pervade every part of surgical practice. Surgeons’ vulnerability to emotions has been underestimated: collaboration between psychologist and surgeons must be established to ensure both patients’ and physicians’ safety.

NATURE AND SHOPPING: AN ANALYSIS OF ASSOCIATED EMOTION-WORDS RELATED TO EVERYDAY EXPERIENCES

A11. General issues and basic processes - Motivation and emotion

Tony Craig, The James Hutton Institute, Aberdeen - United Kingdom

There is growing empirical research base suggesting that positive experiences with nature are associated with positive health outcomes. In everyday life and much of the research in this field, the word ‘nature’ is often used to indicate a particular category of human-nature interaction. Here, we present work exploring people’s reactions to the category ‘nature’ using a simple word elicitation technique. In the first phase of the research we asked participants (N=357) to respond to two broad categories (‘nature’ and ‘shopping’) by describing a recent experience from memory that fell into that category. In addition, participants were asked to list up to 5 words describing the emotions associated with this recalled experience. The emotion words generated by this study were then presented to a separate group of participants (N=96), who were asked to rate the words using four scales: pleasantness, arousal, dominance, and imagability. A total of 1205 words were rated by at least 5 participants each, and a subset of 46 words were rated by all 96 participants. The emotion word ratings were analysed in relation to the category (nature or shopping) associated with the initial occurrence of each word. These findings are compared to the results using the automatic text analysis software LIWC with a particular focus on the arousal and valance ratings. We then discuss the imagability ratings, and relate the findings to the literature on positive experiences in nature.

TOWARDS A GROUNDED UNDERSTANDING OF EMPLOYEE MOTIVATION IN AFRICA: MAKING THE PSYCHOLOGY OF MOTIVATION RELEVANT

D05. Work and organization - Organizational behaviour

Bill Buenar Puplampu, Central University College, Accra – Ghana

The aim of this paper is to explore the motive dynamics behind the initiation, maintenance and direction of work behavior in Ghana and offer a grounded understanding of employee motivation in an African environment. Drawing on extant motivation theory, the study notes that there is a gap in the literature in Africa which limits organizational applications and managerial interventions. Using a 3-item open ended questionnaire the self-reported concerns and thoughts of Ghanaian employees across a spectrum of organisations, economic sectors and organisational hierarchies were collected and analysed through 1st, and 2nd order categorizations, frequency counts and thematic clustering. The findings suggest a five-dimensional model of the motive dynamics that are concomitant with the initiation, direction and maintenance of work behavior. The emergent dynamics clustered around moral, organizational, livelihood, context and personal drivers for employee motivation in the work place. The finding suggest the need for methodological inventiveness in tackling psychological issues in developing areas. The model offers a rubric that has a number of potentialities including: pulling together the disparate work on motivation in Africa; offering a phenomenological basis for further work on motivation in Africa that is both context sensitive as well as joined in to the dominant psychological underpinnings of work motivation theory; shows the possibility for an Afrocentric theory of motivation.

WORKPLACE BULLYING AS A RISK FACTOR FOR MUSCULOSKELETAL DISORDERS: EXPLORING THE MEDIATING ROLE OF EMOTIONAL EXHAUSTION

D04. Work and organization - Well-being at work

Michela Vignoli, Alma Mater Studiorum - University of Bologna, Bologna – Italy
Dina Guglielmi, Alma Mater Studiorum - University of Bologna, Bologna – Italy
Cristian Balducci, Alma Mater Studiorum - University of Bologna, Bologna – Italy
Marco Depolo, Alma Mater Studiorum - University of Bologna, Bologna – Italy

Workplace bullying, defined as the persistent exposure to interpersonal aggression and mistreatment from colleagues, superiors or subordinates, is a major issue in workplaces. In fact, the 2014 survey promoted by the Workplace Bullying Institute showed that 27% of the people interviewed reported that they had direct experience with workplace bullying and 7% of them had experienced it in the last year. In order to study the effects of this phenomenon on workers’ health, a study has been conducted with the aim to understand the effects of bullying on physical outcomes such as Musculoskeletal Disorders (MSDs) and the role played by emotional exhaustion in developing MSDs. Furthermore, in line with the previous literature, also gender, age and physical demands were introduced as control variables. Data were collected by questionnaire in a sample of employees (61.5% were women; mean age=44.2 years; s.dev.=7.9) working in a retail chain in Italy. Analysis showed that emotional exhaustion mediate the relationship between workplace bullying and MSDs (upper body, lower back and arms). Our findings enhance the knowledge concerning how workplace bullying affect workers’ health, highlighting the role of emotional exhaustion in enhancing the occurrence of MSDs.
O1021
THE IMPACT OF STAFF’S ENTREPRENEURIAL SKILLS ON THE DEVELOPMENT OF ENTREPRENEURIAL SELF-EFFICACY

D02. Work and organization - Leadership and entrepreneurship

Oksana Kredentser, Institute of Psychology, Kiev – Ukraine
Galyna Cherushova, National Academy of statistics, accounting and audit, Kiev – Ukraine
Liudmyla Karamushka, Institute of Psychology, Kiev – Ukraine

Objectives. To investigate the effects of secondary school staff’s entrepreneurial skills on their entrepreneurial self-efficacy. Theoretical bases: the concepts of internal entrepreneurship (G.Pinchot & E.Pinchot, S.Kraus, M.Ebner, C.Korunka, H.Frank), entrepreneurial self-efficacy (A.Bandura, D.Forbes, A.De Noble), and individual entrepreneurial traits (Hisrich, Brockhaus, Harry Lois, Pachkovsky). Method. The instruments used included A.De Noble Entrepreneurial Self-Efficacy Scale (adapted by O.V.Kredentser, I.B.Abduleveva), GET TEST, Individual’s Innovative Traits Self-Assessment Scale (N.Lebedev, A.N.Tatarko). The sample was made up of 355 heads and staff of secondary schools. Results. The investigation found statistically significant associations between the levels of staff’s entrepreneurial skills and the levels of their entrepreneurial self-efficacy: the achievement need (rs=0.285, ρ<0.001), independence need (rs=0.151, ρ<0.01), creativity (rs=0.180, ρ<0.001), ability to take risks (rs=0.232, ρ<0.001), dedication and determination (rs=0.189, ρ<0.001), and innovation (rs=0.371, ρ<0.001). The levels of staff’s entrepreneurial skills were also shown to statistically significantly correlate with the levels of their entrepreneurial self-efficacy on the following scales: creation of innovative environment, creation of investor relations, and overcoming of difficulties. Conclusion. The findings can be used in developing internal entrepreneurship in educational organizations.

BRAINSTORMING FOR RECOVERY: THE EFFECTS OF IDEA GENERATION AND PROBLEM RELATEDNESS ON MOOD STATES

A11. General issues and basic processes - Motivation and emotion

Ahmet Yasin Şenyurt, Abant Izzet Baysal University, Bolu - Turkey
Hamit Coşkun, Abant Izzet Baysal University, Bolu - Turkey
Bedirhan Gültepe, Abant Izzet Baysal University, Bolu - Turkey

In contrast to all previous studies in the brainstorming literature, this research investigated for the first time whether or not brainstorming has therapeutic aspects on mood states. Although the cognitive therapy approaches predict that the brainstorming would be helpful for one who suffer from rumination, this prediction has not been tested experimentally so far. It was hypothesised that generating ideas about a different topic would enhance the mood states compared to those generating ideas about self-coping skills. To test this, data collected from 168 participants were analyzed by a 3 (mood: sad, worried, or angry) X 2 (problem: related or unrelated) ANOVA design. After all they were exposed to a neutralization task, mood induction was made. Then, the participants brainstormed about either various usages of a paper slip (neutral topic) or the ways of self-coping skills. At the end of experiment, the mood measures were obtained across the experimental conditions. Findings showed that the participants in sadness condition had higher positive mood scores in the neutral topic than those in self-coping topic. But, the participants in worry and anger conditions were more positive after the brainstorming topic of self-coping. Also, those who wrote more ideas had higher positive mood scores. These findings provide initial evidence for the fact that brainstorming can be used as a part of cognitive therapy and beneficial implications for therapists who should take care about.
O1029
THE EFFECTS OF AFFECT AND COGNITIVE STIMULATION ON IDEA GENERATION PERFORMANCE

A11. General issues and basic processes - Motivation and emotion

Bedirhan Gültepe, Abant Izzet Baysal University, Bolu - Turkey
Hamit Coşkun, Abant Izzet Baysal University, Bolu - Turkey
Ahmet Yasin Şenyurt, Abant Izzet Baysal University, Bolu - Turkey

The studies which investigate the mood and creativity link show inconsistent results about the effects of positive and negative affective valence. Yet, recent studies focus on the mood in terms of pleasantness and arousal level. This study investigated the effects of arousal and pleasantness within cognitive stimulants on idea generation performance. It was hypothesised that pleasantness and high arousal would enhance the brainstorming performance in interaction with the degree of stimulation. To test this expectation, 101 participants enrolled at the experiment in a 2 (pleasantness: pleasant or unpleasant) x 2 (arousal: high or low) x 3 (cognitive stimulation: high, low, or control) ANOVA design. After all of the participants had a neutralization task which involves writing fillers as fast as can, mood was induced in a recall task. The participants in pleasant conditions wrote about their happy or relaxed experiences, whereas the participants in unpleasant conditions wrote about their angry or sad experiences, due to the high or low arousal condition, respectively. After inductions, the participants brainstormed about advantages and disadvantages of a hypothetical extra thumb for 15 minutes. Meanwhile, the participants had seen some stimulant words about the brainstorming problem, according to cognitive stimulation conditions. The results validated the hypothesis and it will be discussed in lights of relevant literature.
O1031
INFLUENCE OF EMPATHY AND VELOCITY ON THE IDEA GENERATION PERFORMANCE IN INDIVIDUAL BRAINSTORMING

A11. General issues and basic processes - Motivation and emotion
Hamit Coşkun, Abant Izzet Baysal University, Bolu – Turkey
Yasemin Ertan, Hacettepe University, Ankara - Turkey

More recently, socio-emotional facilitators as well as cognitive ones have been drawing the attention of researchers in the brainstorming literature. This experimental research investigated for the first time the effect of empathy (low vs. high empathy) and velocity (control vs. velocity) on the idea generation performance of individual brainstormers. The participants in the high empathy condition were instructed to put emotionally and cognitively themselves in one disabled person, whereas those in the low one were instructed to evaluate cognitively and objectively the situation of one disabled person for 3 minute period. Those in the velocity condition were led to write down their ideas as quick as possible, whereas those in the control were received no such instruction. After that, all they brainstormed on the ways to improve the life of disabled persons for 12 minutes. Findings showed a strong effect of empathy in a way that high empathy condition had higher number of unique ideas than low empathy one. This suggests that both cognitive and emotional aspects of empathy may facilitate idea generation than only cognitive aspect of empathy. However, no significant effect was detected for the plausible role of velocity even though those in the velocity condition seemed to generate more ideas than those in control condition. These findings will be discussed in light of the relevant literature in terms of uncovering the link between empathy and creativity.
O1033
AUTONOMIC NERVOUS SYSTEM VARIATIONS IN EMOTION REGULATION WITH ALCOHOL-DEPENDENT PATIENTS

E08. Health and clinical intervention - Community psychological cares

Caroline Claisse, University of Lille 3, Villeneuve d'Ascq - France

Introduction: This study aimed to evaluate the emotion regulation processes, in short term (AS, after 3 weeks of withdrawal) and long-term alcohol abstinent individuals (ABS, at least one year of abstinence), compared to control participants (C) in a positive and negative emotion induction protocol. We studied both the sympathetic branch (recording the electrodermal response) and the parasympathetic branch (recording the cardiac variability) of the autonomic nervous system. Method: The recording was performed for all participants during presentation of high emotional inducing stimuli presenting human interactions (pictures and video sequences). For each participant heart rate variability (HRV) and electrodermal response were recorded before, during and after induction. Participants were asked to evaluate the intensity and the valence of emotional stimuli. In addition, a clinical and cognitive assessment was performed. Results: We observed deficits on the neurophysiological dynamic of emotional regulation in AS and ABS characterized by 1) a significant difference of HRV in recovery time to baseline after an emotion induction, 2) a higher HRV and a higher level of electrodermal response in ABS. Prospect: The results support the relationship between the ability to regulate emotion and the risk of relapse. ABS are characterized by a partial recovery of emotion regulation processes compared to AS. The results suggest specific different therapeutic interventions.
POSTGRADUATE STUDENTS’ EXPERIENCE OF USING LABORATORY ANIMALS FOR RESEARCH PURPOSES: MORAL CONFLICT AND EMOTIONAL CONCERNS

Lucinda Johns, University of KwaZulu-Natal, Durban - South Africa
Sarah Coldwell, University of KwaZulu-Natal, Durban - South Africa

The purpose of this study was to describe novice postgraduate health science students’ experience of using laboratory animals for research purposes. A purposeful sample of eight participants were recruited from the Biomedical Research Unit based at the University of KwaZulu-Natal. Email-facilitated qualitative interview questionnaire and memo taking were used as a source of data collection. The data were analysed using a phenomenological approach outlined by Van Kaam. The analysis revealed participants distress of using animal experimentation and euthanasia to collect data for their research. Participants highlighted moral conflict, guilt and anxiety as concerns when conducting animal research. It is important to identify meaning for students as an animal carer and researcher and to understand their approach in coping with the moral and emotional challenges. A recommendation is to provide stress management and debriefing sessions to assist students in developing appropriate coping strategies.
O1040
FRAMING EFFECT AND INFORMATION MANAGEMENT STRATEGY IN INVESTMENT MARKET

C10. Culture and society - Economic choices
Wenting Yang, Zhejiang University, Hangzhou - China

Impression management is widely used by corporates to create a healthy image, and such goal can be reached by proper use of information management strategies. Kahneman has proposed framing effect to describe the effect of value integration on decision-making. Thalor(1985) also proposed from monetary value perspective that the principle, according to which gains should be segregated and losses should be integrated, would bring higher value in investment. In this research, we developed some information management strategies on the base of framing effect, and empirically tested its stimulation to investment. Participants in experiment were asked to make an investment under 10 scenarios: 3 groups of information (either two big or two small positive information, or one big positive and one small positive information) were announced segregated/integrated and in different chronological order. Result indicates that in all 3 groups, the total investment is significantly higher (P<.05) when two positive information announced separately. Moreover, the total investment is significantly higher (P<.05) than others when small positive information is announced first and big positive information is announced second in the information group of one big and one small. Our finding may bring some inspiration to listed company’s information management strategy.
O1042
THE RELATIONSHIP AMONG ADOLESCENTS' TEMPERAMENT, ANGER REGULATION AND SOCIAL BEHAVIOR

B06. Development and education - Emotion and self

Yiting Chang, National Chiao Tung University, Hsinchu - Taiwan, Province of China
Yihlan Liu, National Chiao Tung University, Hsinchu - Taiwan, Province of China

Purposes: This study attempts to examine how adolescents’ responses to peer anger display in daily interaction related to adolescent anger, anger regulation and internalizing vs. externalizing behaviors. Rationales: The contributions of temperamental styles and emotional regulation strategies to the development of adolescents’ social behavior were investigated. Emotion regulation has been linked to numerous aspects of social functioning in junior schools, including socially appropriate behavior, popularity with peers, adjustment, shyness, and sympathy (Eisenberg, Fabes, Guthrie & Reiser, 2002). Research exploring the associations between temperament and behavioral adjustment has also advanced; clear associations have been found between temperament and both immediate and later adjustment (Rothbart & Bates, 1998; Bates, 1989; Rothbart, Posner, & Hershey, 1995). Studies have indicated that direct linear effects of temperament on social behavior (Rothbart & Bates, 1998; Sanson, Hemphill & Smart, 2002; Seifer, 2000). Furthermore, regulation skills may moderate the effects of the adolescent’s biologically based temperament on his or her social behavior. Participants and Procedures: Participants were 326 pairs of adolescents and their peer (Age, M=13.6; SD=.56) from western Taiwan. After obtaining their agreement, adolescents were administered a series of questionnaires at school in the spring semester of 2014. The questionnaires include Anger Situations and Anger Regulation Inventory (Liu, 2014), Youth Self-Report (YSR, Achenbach, 1991), and Early Adolescent Temperament Questionnaire-Revised-Chinese Version (EATQ R, Capaldi & Rothbart, 1992). Measurement: (1) Anger Situations and Anger Regulation Inventory (Liu, 2014): This inventory was developed based on the interviews with 52 adolescents in Taiwan whose ages were 12~16 years old. It consists of five conflictual adolescent-peer interaction episodes that occurs most often and cause anger for adolescents. Adolescents were asked to rate the extent of anger they feel on a 6-point Likert scale. The Cronbach’s alpha for adolescent anger reaction was .74. Furthermore, adolescents were asked to report the frequency of the use of emotional regulation strategies on a 6-point Likert scale. There are six kinds of emotion regulation strategies, and factor analysis revealed three factors of emotion regulation strategies: 1) Enduring, e.g. “I endured and did not express my anger”; 2) Venting, e.g. “I told her that I am angry”; “I vented my anger by crying or yelling out”; “I walked away immediately”; 3) Cognitive strategy: “I took another position to thought this thing over”; “I told myself not to think this matter”. The Cronbach’s alpha for the factors are .83, .86, .95 for enduring, venting, and cognitive strategy, respectively. (2) Youth Self-Report (YSR, Achenbach, 1991): It is a widely use of measure for children or adolescent internalizing (i.e., anxious, depressive, and withdraw) and externalizing (i.e., aggressive noncompliant, hyperactive) behaviors aged from 11~18 years old. Questions are scored using a three-point Likert scale (0=absent, 1=occurs sometimes, 2=occurs often). In this study, the Cronbach’s alphas are .82 for internalizing behavior, and .65 for externalizing behaviors. (3) Early Adolescent Temperament Questionnaire-Revised-Chinese Version (EATQ R, Capaldi & Rothbart, 1992): The main measure temperament of young people aged 9 to 15, a total of 11 dimensions. Previous studies have pointed out the difficulties adolescent temperament is characterized by poor control and negative emotions high, so this project will be taken to investigate these two constructs as temperament. According to Rothbart and Bates (1998), EATQ -R of three dimensions - activation control, attention and inhibitory control as efforts to control E(effortful control) indicators. The
negative emotional temperament, this project intends to adopt EATQ-R of fear, frustration and depressive mood as an indicator measurements. The Cronbach’s alphas are .70 for effortful control supportive response, and .65 for negative emotionality. Results: Correlation analysis indicated that adolescents’ venting strategy was positively correlated with adolescent’s negative emotionality ($r = .30, p < .001$), but was negatively correlated with adolescent’s effortful control ($r = -.23, p < .001$). On the other hand, adolescents’ venting strategy was positively correlated with adolescent internalizing behavior ($r = .13, p < .05$), and adolescent externalizing behavior ($r = .11, p < .05$). Adolescent anger reaction was positively associated with their use of venting strategies ($r = .41, p < .001$). Adolescent use of venting strategy was positively related to externalizing and internalizing behaviors, but adolescent’s effortful control was negatively related to externalizing behavior. Furthermore, a mediation model was proposed to analyze the relationship among measured variables. Conclusion: This study investigated how adolescents’ response to peer anger display were related to adolescent anger reaction, anger regulation, and internalizing as well as externalizing behaviors under the context of daily interaction. The results indicated that when adolescents experience more anger, they were more likely to use venting strategy to decrease their externalizing behaviors. Furthermore, use of venting strategies was more likely to moderate the effects of the adolescent’s biologically based temperament on his or her social behavior. Contribution and Limitation: Previous studies on the relationship between adolescents’ emotional response and peer’s emotion regulation and adjustment were limited to young children, and findings of the studies were inconsistent. This study has expanded the focused relationship to adolescents, and provided some information about how adolescents’ anger response might have related to their anger expression which in turn related to their adjustment. Although this study proposed a mediation model to explain the causal relationship among variables, the measurement was only in one-time period, which is limited to portray the cause-effect relationship. A longitudinal study is needed in the future.

CAN WE MAKE A PREDICTIVE DIAGNOSIS OF BEHAVIOR DISORDERS IN 3-YEAR-OLD CHILDREN? A 7-YEAR FOLLOW-UP STUDY AT AGE 10

B15. Development and education - Longitudinal analysis

Patrick Leung, The Chinese University of Hong Kong, Hong Kong - Hong Kong

Research in child development investigates continuity/discontinuity in behaviors over time. However, discrepant findings existed, querying whether the early problem behaviors at preschool could predict continual problems in later years or whether they only reflected transient developmental difficulties. This study examined if a clinical diagnosis of behavior disorders at age 3 could predict continual problems at age 10. Such persistence of problem behaviors would support the predictive validity of an early clinical diagnosis at age 3. A group of 221 children were given a full diagnostic workup by clinicians at age 3 and were followed up at age 10. Results indicated that 71% of children diagnosed having behavior disorders at age 3 had persistent problems at age 10, while 70% of children without a clinical diagnosis at age 3 were problem-free at age 10. The odds ratio of having behavior problems at age 10 was 5.97 from children with a clinical diagnosis at age 3 compared to those without (p=.002). Skilled clinical diagnosis integrating multiple sources of information was crucial, since a briefer, single-informant parental interview or teacher questionnaire could not achieve the same high odds ratio. Our findings added to the small number of existing studies supporting the predictive validity of preschool diagnosis. They also advocate for clinical practice the value and feasibility of a formal diagnostic exercise with children at preschool for early detection and intervention.
WWW.BAMBINIINTRAPPOLA.IT: THE CREATION OF A WEBSITE FOR CHILDREN VICTIMS OF SEXUAL ABUSE AND/OR EXPOSED TO DOMESTIC VIOLENCE AND FOR THEIR CAREGIVERS

Chiara Giovanelli, Centro Tiama, Milan - Italy
Marinella Malacrea, Centro Tiama, Milan - Italy
Cristiana Pessina, Centro Tiama, Milan - Italy

In modern societies children and adolescents can be considered at risk when they live in social and relational contexts which can not satisfy their physical and psychological needs. Sexual abuse happens when a child or adolescent is involved in an inappropriate sexual experience considering the physical and psychological development of the person (Malacrea&Lorenzini, 2002). Domestic violence is very prevalent, studies show a prevalence of 3-30% of women who suffer from domestic violence at least once during their lifetime. Children are often witnesses to this situation and moreover get involved in the violent episodes. The experience of seeing the caregiver as vulnerable and unable to protect can determine the idea that only becoming an aggressor can person prevent becoming a victim (Nannini&Perrone, 2012). These experiences are traumatic and have long term effects on the inner development of the person. They are always destabilizing, they are often linked to secrecy and shame and they can also lead to PTSD. In Italy the majority of children and teen-agers have access to the internet and it can be considered an important tool to look for information, remaining anonymous. The website can be considered a useful instrument for children, adolescents and caregivers who need to find information about what is happening in their life. It can help them acknowledge that they need help and to further aid them to have an active role in stopping the abuse and gaining protective resources.
Confronting ethical dilemmas and ethical decision making is a part of psychology as a profession. The aim of this qualitative study was to analyze the decision making process of psychologists in professional practice in Lithuania. 30 psychologists, with an average professional experience of 10 years participated in this study. Internet-based survey system was used to collect responses about the ethical decision making process of psychologists who experienced ethical dilemmas. Thematic analysis was used to analyze qualitative data. Study revealed that psychologists tend to have active approach then confronted with ethical dilemmas, while minority also tried to postpone decision, or do nothing. Psychologists reported that they consulted colleagues during decision making process, either in informal or formal supervision, or in the team of professionals. Participants of this study stated that ethical decision making process was based on ethical code, practice guidelines, or individual algorithms developed during practice. Psychologist reported negative consequences after confronting ethical dilemmas. Psychologists experienced conflicts and tension with a client, staff at the institution they are working in, and experiencing negative emotions.
Interview is the most widely used personnel selection method (Moscoso, 2000) and almost all organizations make final hiring decision according to interview result. Predictive validity of interview is a key research aspect. Previous studies showed that the predictive validities of different types of interviews were quite different from each other. From the viewpoint of interview question, the predictive validity of behavioral interview is higher than that of situational interview (Taylor & Small, 2002); from the viewpoint of interview structure, the higher the level of structure is, the higher the predictive validity of the interview becomes (Campion et al, 1997); from the viewpoint of interview form, individual face-to-face interview has the highest predictive validity (Mcdaniel et al 1994; Schmidt et al 1999). Comprehensive interview is a type of interview combining behavioral interview and situational interview together and it has witnessed wide application. It can solve the problem of low predictive validity existing in behavioral interview, where the low predictive validity is caused by the limited working experience of interviewee. However, there is few research exploring the predictive validity of comprehensive interview (Taylor & O’Driscoll, 2006), especially research about predictive validities obtained at different periods (Sackett et al, 2008). In addition, some characteristics of the candidate, such as self-confidence, working age, etc., will impact the interview result. Based on an item pool of comprehensive structured interview for selection of excellent engineers, this research analyzed the predictive validity of comprehensive structured interview in practical use and discussed the influence of candidate’s working age and confidence on predictive validity. Study 1: Development of item pool for comprehensive structured interview. 18 dimensions were selected according to analysis on engineer’s working performance and competency model, to develop the interview questions and scoring standard. The item pool included 7 questions for behavioral interview and 11 questions for situational interview. These questions were scored to five levels, each of which owns evaluation method. Seventy scientific and engineering graduate students participated in this study to test and revise these questions. Item Response Theory (IRT) was used to test the difficulty and discrimination of these questions. It was found that the item pool has acceptable psychometric property. Study 2: The predictive validity of comprehensive structured interview and related influencing factors. Sixty male engineers having 1 to 11 working ages participated in this study. The mean age of participants was 26.62 years (SD=2.58), the mean working age was 2.58 years (SD=2.39). Three leaders evaluated the 18 dimensions same as question bank and general performance of these participants according to their practical working performance by using 5-point Likert scale, and the results were used as criterion. Three experimenters acted as interviewer to interview these 60 participants one by one and then to evaluate their levels of confidence. The result showed that there is high consistency among the three interviewers and the three leaders; that the predictive validity of comprehensive structured interview is higher than the behavioral interview and situational interview; that the working age of the applicants positively moderate the relationship between the interview score and leaders’ evaluation, which means the longer the tenure is, the higher the predictive validity of the interview becomes, and which makes contribution to prove that the comprehensive structured interview has across-time predictive effect; that candidates’ confidence negatively moderates the relationship between the interview score and leaders’ evaluation, which means the predictive validity of the interview is low for highly-confident candidates. This research shows that the comprehensive structured interview has high predictive validity and certain dynamics, but its validity may be influenced by candidates’ confidence. The results of the research have certain application values in improving the predictive validity of an interview, and also provide theoretical basis for application of the comprehensive structured interview.
"SUPPORTING TECHNOLOGIES": VIDEO DEVICES AS TOOLS FOR EARLY INTERVENTION ON MOTHER-CHILD DYADS

Valentina Manna, University of Naples Federico II, Naples - Italy
Valentina Boursier, University of Naples Federico II, Naples - Italy

The recent development of new technologies for video recording provided great benefits for the microanalysis of mother-child interactions (Stern, 2005). Moreover, the use of video-procedures revealed its usefulness for promoting positive parenting within brief programs for early preventive interventions (Zelenko, 2008). We aimed at developing a pilot clinically-oriented videofeedback program (VF) and testing its effectiveness in improving mothers’ responsivity to child’s needs. 15 mother-child dyads with high level of dyadic risk participated over a 10-meeting program about the experience of parenting, including 4 videorecording sessions (CARE-Index: Crittenden, 2008) and 4 videofeedback sessions (Manna & Boursier, 2014). Pre and post measures of Parental Stress (Parenting Stress Index: Abidin, 1997) and a re-test of the dyadic synchrony have been taken. Our intervention produces 3 effects. 1) Mirroring: the researcher acts as a mirror by returning to the mother what he sees of her relationship with her child. 2) New meaning construction: the joint vision of the video allows to modify maternal dysfunctional representations by giving new sense to the relational exchanges. 3) Repair: VF promotes mother’s ability to recognize child’s needs and moments of rupture to repair. Post-test measures show a) an increased maternal disposition to recognize dysfunctional relational aspects with reduction of defensive responses b) improvement of the dyadic synchrony due to an increase of the mothers’ responsivity.

MOMS IN THE CYBERSPACE: HOLDING FUNCTIONS AND REGRESSIVE MOVEMENTS IN PARENTING WEBSITES

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Valentina Boursier, University of Naples Federico II, Naples - Italy
Valentina Manna, University of Naples Federico II, Naples - Italy
Noemi Venosa, University of Naples Federico II, Naples - Italy

People with similar needs use cyberspace to share knowledge and experiences and search for emotional support (Silke, 1998). The recent diffusion of parenting websites (Moorhead, 2000) as virtual communities for parents, reveals their importance as tools providing an “holding” function (O’Connor, 2001). We aimed at exploring how parents use the cyberspace referring to their own parenting experiences, from pregnancy to the 3rd year of the child, by analyzing 1) the features of the e-parents 2) the underlying reasons for the parenting websites use 3) the manifest and latent contents of the interactions 4) the function of the e-group in these processes. We realized a quali-quantitative analysis of the Italian website “officinagenitori”: Social Network Analysis (Scott, 2000) shows a dense and solid parent network (99 members, mainly first time mothers) who searches for emotional support and shares positive and negative emotional experiences. A latent thematic analysis (Braun & Clark, 2006) highlights the prevalence of themes linked to pregnancy, maternal practices and child-care, and, at a latent level, the activation of narcissistic dynamics linked to mothering and to the specificities of the feminine identity construction. The parenting website use seems to be typical of women: while providing a supportive function, the e-group is also used to evacuate anguish, to search for support by peers, probably because of the regressive movements and identity shifts activated by pregnancy.
O1080
TEEN SEXTING: PRACTICES AND RISKS OF THE ADOLESCENT SEXUAL EXPLORATION IN A “VIRTUAL AGE"

Valentina Manna, University of Naples Federico II, Naples - Italy
Valentina Boursier, University of Naples Federico II, Naples - Italy
Francesca Gioia, University of Naples Federico II, Naples - Italy

Teen sexting refers to a practice increasingly spread among adolescents who exchange their own sexual explicit images and contents through apps and technological devices. While defining a new virtual way of exploring sexuality, as a part of the sexual identity to be defined (Cahn, 1998), it implies clinical and legal risks, e.g. self-objectivation, limitation of sexuality to virtual realities and exposition to pedopornographic issues (Judge, 2012). These issues require preventive interventions to promote an aware exercise of sexuality within virtual adolescents’ communities and cybersex practices. We aimed to explore diffusion and motivations of teen sexting by developing an ad hoc questionnaire administered to 200 adolescents. A quantitative analysis through the SPSS software shows a correlation between sexting and 1) the quality of social networking experience (Social Networking Experiences Questionnaire) 2) the body image control on photos (Body Image Control in Photos Questionnaire). Gender differences show a prevalence of female tendency to sexting, while a Social Network Analysis (Scott, 2000) reveals the specificities of the sexting networks. Ethical implications and reflections for a responsible psychological work in this area will be discussed, taking in account the centrality of web in the emotional development of nowadays adolescents (O’Keeffe, 2011) and the phenomena of sensation seeking and desire to risk typical of adolescence (Racalbuto, 2004).
THE IMPACT OF AUTHENTIC LEADERSHIP IN CHINESE ENTERPRISES AND GOVERNMENTAL DEPARTMENTS ON SUBORDINATES’ ORGANIZATIONAL CITIZENSHIP BEHAVIOR AND TURNOVER INTENTION

D02. Work and organization - Leadership and entrepreneurship

Jianping Xu, Beijing Normal University, Beijing - China
Yu Sheng, Beijing Normal University, Beijing - China
Wei Zhang, Beijing Normal University, Beijing - China
Wenya Li, Beijing Normal University, Beijing - China
Xueyan Zhang, Beijing Normal University, Beijing - China

Authentic leadership (Luthans, 2002) is a new leadership theory developed after the trait theory, behavioral theory and contingency theory, and it is also a kind of typical leadership style. Authentic leadership refers to a process that combines positive psychological capacities and highly developed organizational context together to promote both stronger self-awareness and self-regulated positive behaviors of leaders and subordinates, and to foster positive self-development (Luthans & Avolio, 2003). There are four dimensions in authentic leadership, including self-awareness, internalized moral standard, relationship transparency and balanced processing (Walumbwa et al, 2010). Such authentic leadership can affect others by their own values and believes, they are faithful to themselves and have high moral level (Shamir & Eilam, 2005; May, Chan, Hodges & Avolio, 2003). Relevant research has shown that authentic leadership can produce a positive impact on employees’ behavior or attitude through its typical or model behavior (Avolio et al, 2004; Michie & Gooty, 2005). For example, authentic leadership improves employees’ working performance (Grandey, Fiske, Mattila, Jansen & Sideman, 2005), job satisfaction (Yun-qi, 2010), contribution behavior (Wang & Hsieh, 2013), organizational citizenship behavior (Cottrillet al., 2014) and organizational commitment (Buckner, 2012). In this research, in order to further verify the structure of authentic leadership and its influence, the following three studies are carried out: Study 1: Data were collected from Chinese participants to explore the stability and adaptability of authentic leadership structure under Chinese cultural background. 200 leaders from different kinds of organizations were taken as participants to complete an authenticity leadership questionnaire (ALQ; Walumbwa et al, 2008). These participants included middle managers or senior leaders from different kinds of organizations, such as student organizations, enterprises and public administrative department, etc. and they were administrated by authenticity leadership questionnaire. Exploratory factor analysis and confirmatory factor analysis were used to verify the structural consistency and stability of authentic leadership in Chinese culture and different organizational context. Study 2: The differences of authentic leadership in different organization contexts were compared and analyzed. 50 leaders were respectively selected from the Party and governmental cadres, state-owned enterprises and private enterprises respectively, to complete an authenticity leadership questionnaire. Then the discrepancy of authentic leadership level caused by different backgrounds was analyzed and compared. The results showed that there were significant differences among these three groups of participants. Study 3: This study investigated the effects of authentic leadership on subordinate’s organizational citizenship behavior and turnover intention in Chinese cultural context. Leaders and their subordinates were selected from different organizations. There were many subordinates to a leader, so we paired them into one case. Organizational citizenship behavior scale (Farh, Early & Lin, 1997) and turnover intention scale (Michael & Spector, 1982) were used to respectively measure independent variables, and then the influence of different authentic leadership levels on subordinate organizational citizenship behavior and job satisfaction was analyzed. Conclusions: 1) The authentic leadership questionnaire has good construct validity and reliability, and authentic leadership structure is stable under Chinese cultural background. 2) There are significant differences in authentic leadership level among leaders from government departments, state-owned enterprises and private enterprises. 3) Authentic leadership is significantly positively correlated with
organizational citizenship behavior, and negatively correlated with turnover intention of subordinate. Theoretical implications: Adaptability and stability of authentic leadership in Chinese cultural context are confirmed, leading to further development of authentic leadership research and better clarification of positive impact of typical leadership characteristics on the development of organization and its staff. At the same time, this study explored the specialization of leading type under Chinese cultural background where leader’s morality is emphasized highly, providing theoretical and practical implications for the organization and future work.

PROCESSING OF HOMONYM AND POLYSEMY WITH A CROSS-MODAL LEXICAL DECISION TASK IN MANDARIN CHINESE

A10. General issues and basic processes - Language and communication

Pei-Shu Tsai, National Changhua University of Education, Changhua - Taiwan, Province of China

The study aims to investigate the processing differences between homonym (e.g., bank) and polysemy (e.g., paper) with a cross-modal lexical decision task. In the long debate in psycholinguistic research, two opposing views have been proposed in order to explain how polysemous words are represented in the mental lexicon. One view suggests polysemous words possess independent representations as homonymous words do (Klein & Murphy, 2001, 2002); the other view suggests that polysemy has a single representation while senses are generated upon contexts (e.g., Taylor, 2003). However, for previous studies that directly compared the effects between homonym and polysemy, the contrast was obtained at single-word or phrase level. The present study was designed to extend the comparison to a sentential level. While sentences were directed to the primary meaning of the target word, a visual target that was related to the dominant, secondary, or unrelated meaning of the prime appeared after 1500 ms since the end of the sentential prime, and the participants made a lexical decision. The results showed that when the stimulus-onset-asynchrony between the sentential prime and the target word was sufficiently long enough, the effect contributed by the distance between meanings or senses could be revealed. The study thus offered observations from the language of Chinese and shall shed some lights on our understanding of how meanings/senses of homonymous and polysemous words are accessed.
The goal of our research was to study gender differences of professional morality by entrepreneurs’ in signals. We supposed that it’s possible to see the entrepreneurs’ ethical attitudes as signals of their behavior and mutual relations in the process of professional activity. The diagnostics of entrepreneurs’ professional morality can be carried out by measurement of their moral status, ethical behavior, level of development of moral consciousness, and also an index of participation in doubtful situations from the ethical point of view. It was found that the high level of moral status and of moral consciousness is shown more often by businesswomen, and low level - businessmen. The number of entrepreneurs with an average level of these parameters was identical in both gender groups. The majority of respondents-women had a low index of participation in doubtful situations from the ethical point of view. The respondents-men demonstrated the high index and average index more often. The respondents of both gender groups have shown an average level of ethical behavior; almost the third part of respondents has shown the low level of ethical behavior. Less than the tenth part of interrogated entrepreneurs have shown acceptable level and high level of ethical behavior. In future it’s important to study mutual influence of the analyzed parameters of professional morality of businessmen and businesswomen and to analyze gender differences of the received dependences.

LOST IN TIME? EXPLORING THE LINK BETWEEN TIME PERSPECTIVE, CAREER ADAPT-ABILITIES, AND VOCATIONAL IDENTITY

D15. Work and organization - Career guidance

Antanas Kairys, Vilnius University, Vilnius - Lithuania
Birutė Pociute, Vilnius University, Vilnius - Lithuania
Ieva Urbanavičiutė, Vilnius University, Vilnius - Lithuania
Audrėne Liniauskaite, Vilnius University, Vilnius - Lithuania

The concept of time perspective (TP) refers to the perception of temporal continuity and provides a basis for explaining human behaviour in a variety of settings. Quite similarly, vocational identity can be defined as the continuous 'vocational self'. Finally, career adapt-abilities are seen as a psychosocial resource, which helps people to cope with career related challenges and transitions. Although achieving vocational identity is crucial for career construction, there are yet many unanswered questions on its antecedents. This study aimed to explore how time perspective and career-adaptabilities shape student vocational identity. A survey was conducted in a sample of high school (N = 512) and college (N = 276) students. They filled out a composite measure composed of the Zimbardo Time Perspective Inventory (ZTPI), the Career-Adaptabilities Scale (CAAS), and an adapted version of the Utrecht Management of Identity Commitments Scale (U-MICS). Multi-group path analysis revealed that career adapt-abilities and future and past negative TPs were the strongest predictors of vocational identity. However, several differences between the high-school and the college path models were found. In addition, cluster analysis showed five distinct identity clusters, which were characterized by a different pattern of TPs. The findings draw attention to TP as an important antecedent of vocational identity and provide an additional interpretation of the theoretical career adaptation framework.
The purpose of this study is to review the development and contemporary status of scientific literature databases in psychology. Both psychological literature and the technology used to share it have expanded and evolved rapidly since the end of the 19th century. Today, psychologists have multiple ways to search and retrieve the peer reviewed literature in psychology. The present study reviews the strengths and limitations of the major subscription-based and free literature search databases such as PsycINFO, PSYNDEX, Web of Science, and Google Scholar. As psychology continues to grow as an international scientific discipline, and as technology continues to evolve, it will become increasingly important for psychologists to gain knowledge of and skill in using multiple literature search databases. The present study serves to advance the growth of psychological knowledge by providing a critical review of the major databases available for psychologists.

ACHIEVEMENT AND COMPETENCE MOTIVATION AT SCHOOL: FROM AN EVIDENCE-BASED MODEL TO INTERVENTION GUIDELINES

B02. Development and education - School adjustment, academic achievement and learning disabilities

Silvia Pina-Neves, University of Madeira, Funchal - Portugal

In this paper, we present the theoretical and empirical foundations of a comprehensive model on motivation and achievement in academic settings. The model incorporates four constructs related to motivation and personal competence (i.e. theories of intelligence, causal dimensions, self-concept, and self-efficacy) that establish causal relations among themselves and predict academic achievement. This model has a socio-cognitive rationale, based on works by Dweck, Weiner, Marsh, and Bandura, and it also finds support in 3 main studies, which established the model’s causal paths using structural equation modelling (N=1302), tested their invariance across gender and SES (N=1210), and examined their stability during the transition to secondary school (N=650). The main results revealed that theories of intelligence emerged as the organizing construct of the model, while the specific academic dimensions of self-concept and self-efficacy were achievement’s strongest predictors. Moreover, the model’s partial invariance was supported, as well as its global temporal stability. Nonetheless, there is evidence suggesting that students from lower SES have less adaptative motivational patterns and that transition to secondary school may weaken students’ competence perceptions. Finally, we present implications and guidelines for psychological practice considering SES and transition experiences as challenging conditions and showing the benefits of focusing intervention in competence motivation.

RESOURCE FUNCTION OF IMPULSIVITY/REFLECTIVITY IN INTELLECTUAL ACTIVITY OF YOUNGER SCHOOLCHILDREN

A12. General issues and basic processes - Intelligence and cognitive functioning

Ekaterina Budrina, Institute of Psychology, Russian Academy of Sciences, Moscow - Russian Federation
Anastasiya Ovchinnikova, Institute of Psychology, Russian Academy of Sciences, Moscow - Russian Federation

The main question is: what resource factors of intellectual development are characteristic for successful younger schoolchildren? In our view, it is necessary to study the resource functions of cognitive styles, in particular impulsivity/reflectivity (I/R) as a predictor of academic achievement. In order to define I/R MFFT (J. Kagan) was used. In assessing academic achievements three indicators of academic success were considered (average score in language and mathematics, average score in all subjects, reading skills). In addition, WISC was used. There were 95 students participated in the investigation (mean age of the subjects is 8 years 11 months). During the cluster analysis within I/R two extreme subgroups were distinguished: impulsive (fast/inaccurate) (n=54), reflective (slow/accurate) (n = 20); and third – an intermediate subgroup (n = 21). By comparing "impulsive" and "reflective" significant differences in three academic achievements indicators and sub-tests "Picture Completion", "Object Assembly" and "Coding" were received. In such a way, students with effective strategies for processing information (slow/accurate) not only have high academic achievement, but also a high level of spatial abilities. It can be assumed that the resource function of I/R connected with development of involuntary cognitive control (in terms of accuracy of perceptual scanning) which is associated with an increase in the productivity of intellectual activity.
O1109
HOW TO FEEL GOOD AT WORK: THE ROLE OF HARDY PERSONALITY IN THE MOTIVATIONAL PROCESS OVER TIME

D04. Work and organization - Well-being at work

Silvia Simbula, University of Milan-Bicocca, Milan – Italy

Dina Guglielmi, Alma Mater Studiorum - University of Bologna, Bologna - Italy
Chiara Panari, University of Parma, Parma - Italy
Lorenzo Galli, Alma Mater Studiorum - University of Bologna, Bologna - Italy
Greta Mazzetti, Alma Mater Studiorum - University of Bologna, Bologna - Italy

In recent times the Job Demand–Resources model has been expanded with the addition of personal resources as a predictor of work engagement. At the same time, work engagement seems to foster both kinds (i.e., job and personal resources) over time, creating a motivational positive cycle. The main aims of this work were to present an Italian validation of the Hardy Personality scale, and to evaluate the longitudinal and reciprocal relationships between job resource, hardy personality (as personal resources) and work engagement. The exploratory and confirmatory factor analyses performed on the data, collected on a sample of 754 workers (63% female), confirmed the three dimensions of the Hardy Personality scale (Commitment, Challenge, and Control). Structural equation modelling (SEM) analysis on two waves data of 89 healthcare workers confirmed the solid-scale test-retest and indicated that the relationship between job resource, hardy personality and engagement is indeed reciprocal over time. These results show that hardy personality is a central resource for well-being and motivation in the workplace, in particular, to face the challenges of the current labor market. Moreover, they have important implication for organizational contexts, where the promotion and facilitation of these resources could allow workers to feel more able in dealing with their work goals.
O1121
TIME AND CHANGE IN TEAMS: A LONGITUDINAL APPROACH TO THE IMPACT OF THE GROUP CULTURE ON THE LEARNING PROCESS

D03. Work and organization - Teams performance

Margarida Pinheiro, University of Coimbra, Coimbra - Portugal
Teresa Rebelo, University of Coimbra, Coimbra - Portugal
Paulo Renato Lourenço, University of Coimbra, Coimbra - Portugal
Isabel Dimas, University of Coimbra, Coimbra - Portugal

This research is focused on the analysis of group culture as a predictor of team learning. In spite of the growing interest around team learning, little is known about the conditions that foster it (Passos, Silva, & Santos, 2011). Culture has been identified as a potential factor to be taken into account in understanding team learning (Sessa & London, 2008) not only because teams are integrated into an organizational context but also because the team itself provides a context to its members (Kozlowski & Bell, 2003). It follows that the context in which the team operates offer an opportunity for the development of learning behaviors (Zellmer-Bruhn & Gibson, 2006). In order to understand temporal dynamics, an intrateam approach (Li & Roe, 2012) was followed. Data were collected in three different moments from a sample of 17 project groups, using a questionnaire, and were analyzed through growth modeling. The results suggest that teams differ in how they use learning behaviors over time. Furthermore, different cultural orientations determine different team learning behaviors. We also found an interaction between 1) time and a supportive culture on exploring, experimenting and error management, 2) time and a culture of objectives on exploring, and 3) time and a culture of innovation on experimenting. This research will help to improve knowledge into the learning process in a temporal perspective, which will provide new approaches towards group/teamwork interventions.
O1128
THE DEVELOPMENT OF SCHOOL RELEVANT LANGUAGE SKILLS IN PRIMARY SCHOOL

B01. Development and education - Language acquisition

Elisabeth Schuth, University of Bamberg, Bamberg - Germany
Judith Koehne, University of Bamberg, Bamberg - Germany
Sabine Weinert, University of Bamberg, Bamberg - Germany

Language skills and learning in school are closely related: Language is a school subject and language abilities influence school success (Durham et al., 2007). Academic language, characterized by specific linguistic means to express school relevant content (Schleppegrell, 2001), is often considered specifically important for academic achievement. It is less clear however which linguistic phenomena in particular are most relevant for which agegroup and whether and how these language competences are actually trained in school. We investigated the development of two language components in German primary school children (N = 837) – the developing ability of using clause connectors (CC) and academic vocabulary (AV). The task in both self-developed tests was to choose words to complete sentences: connectors (e.g., although) or academic words (e.g., illustration). Measures were compared to conventional tests of receptive general vocabulary and grammar (PPVT, TROG) in 2nd and 3rd grade. While 3rd graders outperformed 2nd graders on all tests, performance differences were largest for CC and AV (η2cc = .16; η2AV = .12; η2PPVT = .03; η2TROG = .07) and persisted when controlling for age. This reveals that the studied grades are an important phase for CC and AV development, more so than for general language development. Second, the development of CC and AV seems to be subject to school relevant and potentially school mediated language learning rather than an age related development.
O1129
INFORMATION TECHNOLOGY AS AN “EMERGING RISK” FOR WORK-RELATED STRESS: AN INTEGRATED RISK ASSESSMENT APPROACH

D04. Work and organization - Well-being at work

Isabella Corradini, Themis Research Centre, Roma – Italy
Assunta Marano, Themis Research Centre, Roma – Italy
Enrico Nardelli, Università di Roma Tor Vergata, Roma – Italy

The complex set of interactions between humans and machines in workplaces produces an “emerging risk” for work-related stress (EU-OSHA, 2010). The multidimensional nature of this aspect (Corradini, Nardelli 2014) needs an assessment procedure combining and integrating objective measures of working conditions and information coming from workers. The normative background in Italy for work health and safety (Legislative Decree 81/2008) requires public and private employers to assess work-related stress of their workers according to the content of the European Framework Agreement on Work-Related Stress (2004).

One of the most widely used European models for work-related stress evaluation is the HSE approach (2007) that emphasizes the involvement of workers. This research examines the multidimensional nature of IT systems as an “emerging risk” for work-related stress within a tool part of an Integrated Approach (Corradini, Marano, Nardelli 2014). This approach includes the use of multiple standardized instruments able to analyze convergence of extrapolated subjective and objective variables. Specifically, measures analysed in this research are obtained from the self-report questionnaire PRISMA-RA and from a pool of focus groups made up from a sample of workers (N = 246). The authors analyse data via clustering variables of stress work related by sex, age and skill level. The practical implication of the research is the profiling of risk work-related stress on IT component.
PATTERNS OF AND FACTORS AFFECTING MINORITY GROUP CULTURAL ASSIMILATION

Georgia is a multicultural country. The mainstream population is ethnic Georgian. In the country of overall population size of 4,371,535, there are about ten ethnic minority groups: Azerbaijanis, Ossetians, Russians, Greeks, Ukrainians, etc. In a multicultural environment such this, the issue of equality naturally emerges. The research purpose was to investigate factors influencing minority group integration dynamics in mainstream population culture. Theoretical framework used was four-fold model of acculturation strategies. The research operates with variables as understanding of acculturation models by minority and majority groups, the purpose of minority group members’ integration in mainstream culture, cultural values of both groups and experience of interpersonal communication between cultures. As a result we could conclude that understanding on integration/assimilation of minority group plays important role in experiencing cultural assimilation. Together with cultural values of both groups, it determines the character of interpersonal relationships, pattern of integration. The results give ground for further research in this direction, though they already provide a platform to explain and predict the pattern of assimilation of minority group.
Virtual space or cyber space addiction is new generation addiction that many young adults are facing today, the fantasy of many young adults which could have gone un-nourished are getting that satisfaction by computers or any other such technology driven medium or devices (Appel et. al, 2012). In the present study an attempt is made to identify the extent of digital technology use on adjustment neuroticism disorders. A group of 215 students of age between 17 to 22 years were addressed with a 105 itemed questionnaire, out of 215 respondents, 78 were girls and 137 were boys. All of the 215 respondents were students studying in different educational institutions such as SKMJ higher Secondary School; Malabar College, Waynad; St. Marries College, Waynad; and Sri Guru Narayana College, Allepi, India. They were administered Adjustment neuroticism dimensional Inventory (ANDI) developed by R N Singh and Bhargava, M. This inventory consists of 105 items in three response alternatives and measures seven dimensions of personality: Self-esteem-self-inferiority, happiness-depression, calmness-anxiety, naturality, obsessiveness, independence-dependence, feeling of healthy-hypochondriasis, innocence-guilt feeling. It can be used on the both sexes from age group 17 to 22 and it is one of the widely test known for clinical assessment. Two-way ANOVA was employed to find out the difference between adolescents with high, moderate and low levels of usage along with gender for personality dimensions taken as dependent variables. Results revealed that as the Usage level of Digital Technology increased Depression scores also increased linearly and significantly. Guilt scores were found to be increasing along with the Usage level of Digital Technology. Female respondents with high usage of digital technology were observed to have more Hypochondriac, whereas female respondents with less usage were found to be least Hypochondriac. The recognition of such problematical issues is to be done at the earliest time possible and the results obtained pertaining to the disorders, one has to develop confrontation to the addictiveness of such impulsive pathological media abuse. The arrival of such deteriorating conditions of young adults are to be prioritized and subjected to further research and study to accurately treat such specified indifferences or tendencies of addictiveness. Any addiction may and will lead to cognitive and pathological disorders, in any case, the mind of an young adult will require sufficient amount of time to rehabilitate—given that regular clinical therapy and interventions are organized with the aid of professionals, family and friends.
O1139

DETERMINANTS OF ELDERLY DEPRESSION: A COMPARISON BETWEEN ELDERLY RESIDING AT HOME VS IN AN INSTITUTION

E15. Health and clinical intervention - Aging and dementia

Mithat Durak, Abant Izzet Baysal University, Bolu - Turkey

The current study aims to examine the environmental and social factors affecting the depression levels of elderly residing at home vs. in an institution. Being loyal to the principles of voluntary participation and confidentiality, after an interview, data is collected from 846 participants residing at home and 924 participants residing in retirement houses. In the present research, the relationships of socio-demographic characteristics, factors specific to residing at home vs. in an institution, health and functional independence related factors, life events occurred in recent or distant past are investigated. In institution, there is no gender difference observed in terms of depression levels; whereas among the elderly residing at home females show higher depression levels than males. The environmental and individual factors that have protective role against depression are identified as being married, being with the spouse, physical well-being, positive perceptions about the course of the disease, being satisfied with their home, meeting own needs at home, being satisfied with the institution, the opportunity to visit their families, and the opportunity to be visited in the institution. In the present study, the similarities and differences between home and the institution, adult child-older parent relationships, social structure of community and culturally expected roles from elderly while explaining depression in the elderly are discussed.

FACTORS AFFECTING PSYCHOLOGICAL WELL-BEING AMONG ELDERLY BEHÇET DISEASE PATIENTS A COMPREHENSIVE COMPARISON

E09. Health and clinical intervention - Positivity and well-being

Feride Ozlem Elagoz, Sivas Cumhuriyet University, Sivas - Turkey
Emre Senol-Durak, Abant Izzet Baysal University, Bolu – Turkey

Individuals suffering from physical illnesses have impact on both sufferers and their families. However, the positive effect of illnesses on patients has not been examined extensively. Regarding physical illnesses, Behçet’s Disease, one of the most commonly seen dermatological illnesses occurring due to inflammation of blood vessels was selected. The aim of the present study was to scrutinize the contribution of stress appraisal, emotional approach coping and coping strategies on satisfaction with life with a model conceptualized by Schaefer and Moos (1998) in the samples of elderly Behçet’s disease patients. The structural equation analysis of the model revealed that emotional expression, problem focused coping, and religious coping was significantly correlated to life satisfaction. The findings are discussed in the context of the theoretical model.
The purpose of the study is searching conflict and negotiation in Turkish culture. For this reason 2667 proverbs from A Dictionary of Turkish Proverbs (Ömer Asım Aksoy, 1993) were examined by four judges. In this study, 557 proverbs were appeared as related with conflict and negotiation. Relevant qualitative analysis revealed some interesting findings about nature of conflict and negotiation in Turkish culture. Some notable findings are reported in here. For example "reciprocity" is important in Turkish culture under conflicting situations. The results suggest that reciprocity has two sub-factors. The first factor can be defined with fatalism. And the second factor can be defined with interpersonal relationship. The findings showed that Turks believe that underestimation of opponent gives rise unexpected damages. That’s why the enemy must be eliminated at the beginning. On the other hand forgiveness is valuable in Turkish culture and they advise to pity on who ask for mercy. Turks also believe that in-group conflicts are more harmful and coercive than the out group conflict. In group conflict deteriorates the harmony in relationship. So they advise to avoid to be in conflict with relatives or people who are ones’ closes. They also warn not to be in conflict with woman. Because they believe that tricky woman always wins the negotiation. In Turkish culture it is recommended that to be careful in communication. Ancients advice to listen, review and select the words before talk. This study is supported by TUBITAK 1001 project no: 113K548 named Conflict and Negotiation in Turkish Culture.
THE EFFECT OF EMOTIONAL PREJUDICE ON INTERGROUP PEACE INTENTIONS

O1146

C05. Culture and society - Group processes and intergroup relations

Ahmet Demirdağ, Middle East Technical University, Ankara - Turkey
Derya Hasta, Middle East Technical University, Ankara - Turkey

In the beginning of 2013, a peace process (PP) was initiated by Turkish Government to find a solution to the Kurdish Question. This study investigates the level of support on the PP in the conceptual framework of infrahumanization theory (IHT) in a realistic context. According to IHT, people are inclined to associate outgroups with human essence (e.g., secondary emotions) less than ingroups, which results in negative attitudes/behaviors toward outgroups. We tested the effects of an experimental manipulation in which a call in support of the PP was made with primary or secondary emotions by an ingroup or outgroup member. To this end, 184 Turkish and 160 Kurdish students from the universities in Ankara and M. Artuklu University were asked to fill in Infrahumanization and Peace Process Support Scales after reading the peace call. Participants were randomly assigned to a 2(ethnicity of the person making the call: Turkish-Kurdish) X 2(emotion type: Primary-secondary) X 2(emotion valence: Positive-negative) factorial design. The findings showed that both Turkish and Kurdish participants associated the outgroup member with secondary emotions less than the ingroup member when the peace call was made with secondary emotions; and accordingly, they supported the PP less when the peace call was made with secondary emotions by the outgroup member. No such bias was observed when the peace call was made with primary emotions. The results were generally in line with and discussed in terms of IHT.
Psoriasis is a chronic, recurrent disorder characterized by heavily scaled plaques on skin. Psoriasis negatively affects patients’ physical, emotional, psychological and social life which also intensifies the lesions. Literature emphasizes the importance of psychosocial interventions in helping patients cope effectively with stress which is expected to ease the lesions. The purpose of this study is to investigate the explanatory roles of experiences related to Psoriasis, social support, and emotional approach coping on psychological symptomatology among patients with Psoriasis. Socio-demographic questionnaire, Brief Symptom Inventory, Experiences of Patients with Psoriasis Scale, Multidimensional Perceived Social Support Scale, Emotional Approach Coping Scale were administered to the participants. Data are analyzed using independent groups t-test, variance analysis, multiple regression and structural equation modeling. Analyses were conducted with data from 186 patients. Results showed that the experiences related to Psoriasis, namely distortion of body-image, social isolation, and difficulty in verbal communication were highly and positively correlated with psychological symptomatology. The implication of the study was to draw attention to the psychological components of the disorder experience and guide clinicians to work with psoriatic patients more effectively.

THE INFLUENCE OF A GAMBLING CONTEXT ON THE SOCIAL REPRESENTATION OF RISK

C15. Culture and society - Qualitative methods

Jérémy Lemoine, University of Reims Champagne-Ardenne, Reims - France
Christine Roland-Lévy, University of Reims Champagne-Ardenne, Reims - France

The aim of this presentation is to study the influence of a gambling context on the social representation of risk. The social representation of risk in general has already been identified in a previous study (Kmiec & Roland-Lévy, 2014). According to Abric (1994), social representations are associated to behavior; thus, studying social representation of risk in the specific context of gambling provides clues to better understand gambling disorders. 1,106 students answered a free association task based on the target expression “risk in a gambling context”. Two scales measured the characterization and the valence dimensions of the terms produced. Based on the results, four different analyses were used: a categorical analysis, a prototypical analysis, a factorial analysis and a tri-componential analysis. The social representation of risk in a gambling context differs from the one in a general context. It is organized around three main themes: gambling games and their characteristics; emotions involved in gambling; and gambling disorders and their consequences. Females and males share the same social representation of risk. The association of the prototypical analysis and the tri-componential analysis indicate that three terms belong to the central system: “danger”, “to lose” and “losing money”. This study showed variations of the social representation of risk due to the introduction of a gambling context and the importance of the role of emotions in this context.
O1158
TWO BRAINS MAKE ONE MIND: HYPERSCANNING STUDY ON SYNCHRONIZED SINGING/HUMMING BETWEEN TWO PEOPLE USING FNIRS

A06. General issues and basic processes - Cognitive neurosciences and neuroimaging

Naoyuki Osaka, Kyoto University, Kyoto - Japan
Takehiro Minamoto, Kyoto University, Kyoto - Japan
Ken Yaoi, Kyoto University, Kyoto - Japan
Miyuki Azuma, Osaka University, Osaka - Japan
Mariko Osaka, Osaka University, Osaka - Japan

Human brain have been developed to communicate with others, however it seems unclear how our brain achieves interactive communication. Here, we report the neural synchronization for singing/humming between two people, simultaneously measuring two brain activities using a hyperscanning approach. Using a functional near-infrared spectroscopy (fNIRS), brain activity of two individuals was measured while they performed a cooperated humming or singing with face-to-face and face-to-wall (preventing them from observing other’s face by a wall). The results showed a significant increase in the neural synchronization in the left inferior frontal cortex (IFC) in both the singing and humming regardless of existence of the wall, in comparison to the single singing/humming. On the other hand, the right IFC showed an increase in the neural synchronization during humming but not singing, possibly due to higher dependence on musical processing. Those results suggest a usefulness of the fNIRS-based hyperscanning in natural social interaction.
Child care institutions have to perform high and continuously improved quality of early education. Recent Studies show that in spite of tremendous efforts of further education quality in many cases is not sufficient. How can organizational development in child care institutions be promoted e.g. by the transfer of knowledge from professional trainings into practice. Our theoretical model referring to Baldwin and Ford suggests training design, trainees characteristics and work environment (shaped by managerial strategies) as crucial factors for the transfer processes following professional trainings. We conducted two multi-methods longitudinal studies. 19 training participants and their institution managers were interviewed before and after a training to investigate in transfer strategies. The results of the semi-structured interviews show that training often was not closely committed to institutional goals. In a second in-depth-multiple case study with 4 child care institutions we explored the promoters of organizational change by 3 qualitative interviews with the institution managers interviews over a period of 1 year and final group discussions with the staff. This study also revealed that organizational change was not strategically planned but changes occurred in small steps toward a vague vision of better pedagogy. Continuous changes depended on demands and support by the providing companies. Conclusions for qualification and training of educational leaders are discussed.

WOMEN AND STRESS AT WORK

D04. Work and organization - Well-being at work

Philippe Sarnin, University of Lyon, Lyon - France
Behnaz Boroumand Jullien, University of Lyon, Lyon – France
Margaux Vignet, University of Lyon, Lyon – France

Studies about stress at work very often show that women are more stressed than men. But this systematic difference needs to be explained. Taking account of the work status, the familial situation, we hypothesize a more general effect of the social construction of gender inequalities among jobs and their characteristics (autonomy, workload, etc.) between men and women. 1163 women and 4787 men were questioned during compulsory medical examination within the same firm. The questionnaire includes: Job Content Questionnaire (Karasek& Theorell, 1990), Effort/Reward imbalance scale (Siegrist, 1996), Hospital Anxiety and Depression scale (Mykledun& al., 2001), Perceived Stress Scale (Cohen & al., 1983) and various questions about marital qualification, characteristics of the job, marital status, children in charge, etc. Statistical analyses were realized using multiple regressions. Analyses of data show that the difference between men and women are less important when we compare them for the same job and the same marital status and the same number of children in charge. The unequal repartition of men and women, according to positions held, lead women to occupy jobs with more psychological demand, less autonomy and less reward. So, the women jobs have the characteristics associated with higher stress at work. In conclusion, firms have to be more attentive during recruitment and promotion to avoid discrimination against women which may also have a negative impact on their health.
O1169
COMMUNICATIVE ABILITIES IN PATIENTS WITH TRAUMATIC BRAIN INJURY (TBI): THE ROLE OF THEORY OF MIND AND EXECUTIVE FUNCTIONS

A10. General issues and basic processes - Language and communication

Presenter: Alberto Parola, University of Turin, Turin - Italy
Ilaria Gabbatore, University of Turin, Turin - Italy
Katiuscia Sacco, University of Turin, Turin - Italy
Romina Angeleri, University of New Mexico, Albuquerque - United States
Bruno Giuseppe Bara, University of Turin, Turin - Italy
Francesca Marina Bosco, University of Turin, Turin - Italy

Persons with Traumatic Brain Injury (TBI) frequently report communicative impairments, both at Linguistic and Extralinguistic levels, as well as cognitive difficulties, such as executive functions (EF, attention, working memory, and planning) and theory of mind (ToM) deficits. Despite several studies confirmed these impairments, it is not completely clear the relation among such abilities. Aim of the present study is to investigate the relationship between EF and TOM and pragmatic deficits in chronic patients with TBI. Thirty TBI patients and twenty-four healthy controls performed Linguistic and Extralinguistic tasks of the Assessment Battery of Communication (ABaCo). The tasks investigate the comprehension and production of direct and indirect communicative acts, deceits and ironies. In addition, participants performed a neuropsychological assessment investigating ToM and EF. Results show that patients performed worse than controls in pragmatic tasks, neuropsychological and ToM tests. We also observed a trend of difficulty in the comprehension and production of standard communicative acts, deceits and ironies. A regression analysis reveals that EF and ToM partially explain patients’ difficulties, but they are not sufficient to completely explain TBI’s communicative deficits. The identification of the role played by cognitive functions to sustain communicative deficits is crucial to design efficacious rehabilitative treatments.
A THEORECTICALLY ANCHORED AND MULTI-MODAL TREATMENT APPROACH IN AN OUTDOOR BEHAVIORAL HEALTHCARE PROGRAM

Outdoor Behavioral Healthcare treatment (OBH) is emerging as a promising and innovative therapeutic field that provides interventions for struggling adolescents (Russell, 2003) and young adults (Hoag, Massey, Roberts, & Logan, 2013). The Outdoor Behavioral Healthcare Council describes OBH programming as “the prescriptive use of wilderness experiences by licensed mental health professionals to meet the therapeutic needs of clients” (Gass, et al., 2014). Case Study: This paper describes a case study of a 16-year-old Caucasian male from the United Kingdom who was referred to treatment at an Outdoor Behavioral Healthcare (OBH) program for oppositional behaviors, emotion dysregulation, family conflict and academic underachievement. This case study provides description of the assessment, diagnosis, treatment planning and treatment of a client in an OBH program. Theoretical Approach: In Russell and Phillips-Miller (2002) qualitative study adolescent participants identified peer dynamics, the therapeutic relationship, challenge and structure of treatment and the facilitation of reflection through outdoor activities. Each of these components are described in the paper. This paper also explores the theoretical underpinnings of treatment in an OBH program. In addition Walsh and Golins’ (1976) Outward Bound Process Model (OBPM) is described and applied to the case study to describe the wilderness process participant’s experience which leads to the reorganization of beliefs and perceptions of self and others. Follow-up: The client was followed up at 6 months and one year post treatment. Results showed a clinically significant improvement from admission to discharge and gains were maintained at 6 months and 1 year post treatment. In addition, qualitative feedback is provided from the client into how and why OBH treatment worked for this client.

BULLYING: COPING STRATEGIES FOR TEENS

B08. Development and education - Bullying and aggression

Marlene Caban-Huertas, Universidad Pontificia Bolivariana Bucaramanga, Bucaramanga - Colombia
Ana Fernanda Uribe Rodriguez, Universidad Pontificia Bolivariana Bucaramanga, Bucaramanga - Colombia
Manuela Deleon, Universidad Pontificia Bolivariana Bucaramanga, Bucaramanga - Colombia
Katherine Infante, Universidad Pontificia Bolivariana Bucaramanga, Bucaramanga - Colombia
Joel Vargas, Universidad Pontificia Bolivariana Bucaramanga, Bucaramanga - Colombia
Sandra Sanchez, Universidad Pontificia Bolivariana Bucaramanga, Bucaramanga - Colombia

The purpose of the research is identify coping strategies in adolescents involved in bullying, both aggressors and victims. Bullying is defined as "a situation where the person is exposed, repeatedly and over time, to negative actions by one or more students" (Olweus, 1995, p.197). Coping strategies are defined as "those constantly changing cognitive and behavioral efforts being made to improve specific external or internal demands that are assessed as excessive or overflowing resources of individuals" (Lazarus&Folkman, 1986 cited by Gomez Luengo & Romero, 2006, p.164). Sample consisted of 47 adolescents between 16-19 years of a school from Bucaramanga (Colombia). Instruments used to collect data were the Questionnaire Paredes, Legaand Vernonto Measure Bullying Phenomenon of Paredes, Legaand Vernon (2006) and the Coping Strategies Scale -Converted of Londoño, Henao, Puerta, Posada, Arangoand Aguirre(2005). Results show 21.27% students have attacked classmates; while 42.55% students have been victims of some violent action by peers. For coping strategies 44.68% indicated they never seek professional help for guidance. Also 48.93% indicated never seeks professional help to reduce anxiety symptoms or discomfort. Teens involved in bullying (aggressors or victim) prefer distract their attention of the issue and don't have skills to ask for help. Psychologists have social responsibility to prevent and intervene with bullying to reduce level biopsychosocial consequences.
O1178
PSYCHOMETRIC PROPERTIES OF THE TURKISH VERSIONS OF REASSURANCE SEEKING QUESTIONNAIRE

A03. General issues and basic processes - Psychometrics

Bikem Haciomeroglu, Gazi University, Ankara – Turkey
Mujgan Inozu, Hacettepe University, Ankara – Turkey
Ece Tathan, Middle East Technical University, Ankara – Turkey

Reassurance seeking has been considered as a maintaining factor in OCD. The study aimed to conduct the adaptation of the Reassurance Seeking Questionnaire (ReSQ) (Kobori & Salkovskis, 2012) into the Turkish language, and to examine its psychometric properties. The sample of the study composed of 403 university students and 110 adults. As for the internal consistency, the Cronbach’s alpha coefficients of Source, Trust, Intensity and Carefulness scales were .90,.87,.77, and .86, respectively. The test-retest correlations after 4-week interval ranged between .61 and .72, p < .001 for the ReSQ scales. Original factor structure of the subscales was confirmed by using maximum-likelihood confirmatory factor analyses through LISREL. Multiple regression analysis conducted to assess the concurrent validity revealed that Carefulness scale was the best predictor for Obsessive Compulsive Inventory (OCI-R) total (R2=.21, p<.001), checking (R2=.09, p<.001) and washing scores (R2=.13, p<.001). The ReSQ scales significantly correlated with each other, and with the Obsessive Beliefs Questionnaire, Disgust Sensitivity Scale, Guilt Inventory and Trait Anger Expression Inventory. As for the criterion validity, both the student and adult participants within the lowest and highest 25th percentile of OCI-R total scores significantly differed from each other in terms of their ReSQ scores, except for the Trust scale. Results revealed that the Turkish version of ReSQ was a reliable and valid measure.
O1179
INTENTION TO PAY TAXES OR TO AVOID THEM: THE IMPACT OF SOCIAL VALUE ORIENTATION

C10. Culture and society - Economic choices

Ambra Brizi, Sapienza University of Rome, Rome - Italy
Mauro Giacomantonio, Sapienza University of Rome, Rome - Italy
Birga Schumpe, Helmut-Schmidt University, Hamburg - Germany
Lucia Mannetti, Sapienza University of Rome, Rome - Italy

Purely economic factors such as audit rates and fines have shown inconsistent effects on tax payments suggesting that they are not sufficient to explain tax compliance. Moreover, the tax compliance rate is surprisingly high in comparison to what the standard economic model would predict. In the last fifteen years, literature aimed at solving the so called “puzzle of compliance” has increased and pointed out several factors that could possibly clarify tax compliance processes such as knowledge of the tax law, trust toward the political system, as well as personal or social norms. The studies to be presented here examined the impact of social value orientation on tax morale and on intention to avoid/evade taxes. Social value orientation was examined both as chronic personal orientation (Studies 1 and 2) and as contextual factor made salient by experimental manipulations (Study 3). Results of all three studies are supportive of a relationship between social value orientation and measures of tax compliance. Furthermore, results of Study 3 provided evidence for a causal effect of social value orientation on intended tax non-compliance. Mediation analyses in both Study 2 and Study 3 revealed that the effect of social value orientation on intended tax non-compliance was mediated by tax morale. Results are discussed with reference to their potential practical applications.
SURFACING (IM)POSSIBLE VICTIMS: THE ROLE OF GENDER, SEXUALITY AND POWER IN CONSTRUCTING THE CONDITIONS OF POSSIBILITY FOR VICTIMS OF FEMALE SEX ABUSE

Female sex abuse (FSA) has recently emerged as an object of enquiry in the academy and medico-legal systems both globally and in South Africa. However, the academic research is primarily focused on perpetrators, resulting in very limited information on its victims. Victim data that are available are based mainly on studies conducted with perpetrators. FSA victimhood is underexplored and many victims remain invisible to the criminal justice and health systems and are barely discernible as objects of human science knowledge. Despite the accent on vulnerable populations and human rights in the contemporary world, there is very little work on precisely why these victims remain invisible. Accordingly, this research aims to identify the cultural conditions of possibility for FSA victimhood as a means to advance contemporary critical understandings of the role of gender and sexuality as instrument-effects of modern power. The study’s objectives were achieved by interviewing persons who self-identified as FSA victims. A Foucauldian informed discourse analysis was employed to interpret the transcriptions of these interviews and to explore conditions of possibility for FSA victimhood as they were constructed in the interview context. The findings illustrate precisely how deeply engrained constructions of gender and sexuality both produce and constrain the possibilities for reporting, disclosing and self-identifying victimhood. Overall, a particular configuration of access to non-normative psychological, gender and ‘sex’ discourses mostly mediated by the internet and incited through the confessional context of the interview provides the possibilities for an identification as a victim of female sex abuse. These points of identification are coordinates for disrupting normative understandings of gender, sexuality and power in sex abuse and thus constitute the beginnings of a counter-knowledge on transgressive sexualities. This counter-knowledge will further contribute to critical accounts of the way that power/knowledge produces, reifies and naturalises human subjects through technologies of sexuality. Keywords: Female sex abuse; female sexual perpetrations; sexual abuse victims; sexuality; gender; power; discourse; discourse analysis; South Africa
The topic of this presentation is support in intergenerational relationships between adult children and their parents. According to the concepts of intergeneration solidarity and exchange theory, support in adult families depends on relationship quality, norms, opportunity structures as well as reciprocity. Focussing on support our research questions were for the differences between gender, generation and types of support as well as for the prediction of support. Therefore, a diary study was conducted. The sample consisted of 100 adult children between 23 and 40 years, 97 of their mothers and 82 of their fathers. Family members completed a standardized diary for 28 days. It informed about emotional, instrumental, informational and financial help between family members. Additionally, questionnaires were administered to the family members separately. Results showed differences between gender, generations and types of support. E.g., mothers gave more instrumental help than fathers, fathers more informational help than mothers. The assumption of reciprocity was confirmed. However, the effect was mediated by the perception of the received support. Additionally, the relationship quality as well as social norms predicted support. The results underline the benefit of a long-term diary method. They are discussed with respect to the research of intergenerational support.
O1195
UPDATES ON INCLUSION IN BRAZILIAN SCHOOLS

Nadja Silva, Federal University of Alagoas, Maceió - Brazil

We discuss about the concepts and practices of educational inclusion. The social and educational inclusion is widely assumed by Brazilian government. However due to lack of adequate infrastructure and of qualified human resources, is extremely difficult to make this proposal effective in schools. We evaluated these difficulties and we present here a set of actions designed to confront the lack of qualified human resources. Among developed actions highlight, for example, conducting workshops for teachers, with the goal to reduce the levels of the interpersonal conflicts and stress within the work environment, and seminars to update them on Inclusion' concepts and to stimulate exchanges of experiences between professionals. In addition, we also conduct consultancy where teachers talked with specifics about their work with students with learning difficulties. These actions were developed in partnership with the university through psychology students. In this way we have promoted the integration of teaching-research-extension approaching these students to the educational problems of their city. Over three years the results show the decreasing truancy in middle school and the teachers’ motivation to engage with the transformation of the schools has increasing. Finally these results have encouraged the school communities to design the educational inclusion as a deep review of their political and pedagogical practices.
O1198

EFFECTIVENESS OF TEACHING COMMUNICATIVE PATTERNS OF PLURALISTIC FAMILY ON MENTAL SYMPTOMS OF PATIENTS WITH PSYCHOSOMATIC DISORDRES IN YASOUJ

E06. Health and clinical intervention - Family treatments

Sadrollah Khosravi, Islamic Azad University, Firoozabad – Iran
Masoumeh Hamidi, Islamic Azad University, Yasouj – Iran
Ghasem Naziri, Islamic Azad University, Shiraz – Iran
Sareh Behzadi Poor, Islamic Azad University, Shiraz – Iran

The aim of this study was to measure the efficacy of teaching communicative pattern of pluralistic family on mental symptoms of patients. This experimental study was designed to have a pre-test and post test and also a control group. Subjects of this study were comprised of Medical Centers clients in Yasouj and was based on random sampling. Thirty patients were selected according to the revised version of family communication patterns of Koerner and Fitzpatrick. Two dimensions, laisseze fair and protective family patterns, were taken into account through the process of selection. DASS-21 questionnaire was administered to 30 subjects and they were randomly divided into a control and an experimental group. Ten training sessions, 90 minute each, were held for experimental group exposed to pluralistic communication patterns. The test was run for two groups. The result of covariance analysis revealed that with regard to mental symptoms, and there is a significant difference in both groups (p<0.001). But there is not significant difference between experimental and control groups in the aspects of mental symptoms (depression, anxiety, stress). Based on this result, it can be concluded that pluralistic communication methods based on high levels of listening speaking interactions can be effective in reducing mental symptoms increased. Keywords: communication pattern, Psychosomatic, mental symptoms
Emotions have always received considerable attention within the psychological domain and the application of devices coming from the neuroscientific approach has given the possibility to explore the spatio-temporal features of emotion processing. Affective stimuli induce psychological states related to specific physiological reactions for adaptive behavioral responses, and appraisal mechanisms to emotion perception are fundamental for this adaptive behavior. The prefrontal cortex (PFC) plays a key role in emotion evaluation and different explanatory models tried to account for the differential hemispheric recruitment with respect to these components. Nevertheless the relationship between electrophysiological (EEG), hemodinamic (Near-Infrared Spectroscopy, NIRS) and appraisal components (SAM ratings) has to be clarified. The aim of this study was to investigate a possible relationship between cortical responses and explicit appraisal mechanisms during emotion recognition. Participants were submitted to an emotion recognition task and were asked to rate the pictures according to the experienced valence and arousal (SAM). Hemodynamic and electrocortical measures were co-recorded by NIRS and EEG. Results showed an increased activation of the right PFC while viewing negative patterns and a significant correlation with the subjective ratings. This is particularly relevant in that it suggests a relationship between cortical responses and subjective evaluation components.
MENTAL HEALTH CARE IN THE DEPARTMENT OF SANTANDER: CHARACTERIZATION OF SERVICE RECIPIENTS IN CARE CENTERS AT THE PONTIFICAL BOLIVARIAN UNIVERSITY (PBU)

E02. Health and clinical intervention – Psychodiagnosis

Ana Fernanda Uribe Rodriguez, Universidad Pontificia Bolivariana Bucaramanga, Bucaramanga - Colombia
Hector Jose Velazquez Gonzalez, Universidad Pontificia Bolivariana Bucaramanga, Bucaramanga - Colombia

Mental health is "a dynamic state that is expressed in everyday life through behavior and interaction in a way that allows individual and collective subjects deploy their emotional, cognitive and mental resources to transit every day, to work, to establish meaningful relationships, and to contribute to the community "(p.1) (1616 Act, Congress of the Colombian Republic, 2013). The research objective was to characterize receptors of psychological clinical service at centers in PBU, at Bucaramanga. Study was conducted with a quantitative methodology non-experimental cross-descriptive. Cases analyzed were 86 consultants. There was an equitable distribution for gender. Regarding marital status, 76% reported being single and socioeconomic levels were more frequently for stratum 2 and 3 with a 63%. Reasons for consultation that occurred most frequently were problems in relationships (17%, n = 17), behavioral problems (13%, n = 11), academic difficulties (12%, n = 10), and mood alterations mostly depressed (10%, n = 9). These motifs are associated with gender and school violence, suicidal ideation or attempts, and frequent use of illicit drugs or alcohol. The results are consistent in that diagnoses related to mood disorders are more prevalent over other types of psychological pathologies in Colombia. It is urgent to assess the social conditions of Santander, which could promote the development of symptoms associated with psychological disorders; and to make a good diagnose of the health system of the Department to evaluate its responses to the mental health situation of the people.
O1215

HUMANITARIAN WORK PSYCHOLOGY: THE IMPACT OF AFFIRMATIVE ACTION ON ORGANIZATIONAL JUSTICE AND EMPLOYEE WORK BEHAVIOR IN SOUTH AFRICA

D05. Work and organization - Organizational behaviour

Susan van Schie, University of Cape Town, Cape Town - South Africa
Ines Meyer, University of Cape Town, Cape Town - South Africa

Affirmative action belongs to the most controversial personnel procedures for companies. In South Africa, the Employment Equity Act No. 55 has been effective since 1998 to establish social justice in the labor market and overcome inequalities and poverty following Apartheid. Several organizational scholars used justice theories as a conceptual lens to make sense of the extensive body of knowledge on attitudes towards affirmative action (Harrison et al., 2006), as well as to understand how it influences workplace unfairness (Beugre, 2002; Cropanzano et al., 2005; Slaughter et al., 2002). Nevertheless, more than 35 years of research are largely based on hypothetical scenarios and US student samples. As such, the generalizability of these studies is very limited and its replication in a real-world setting has been identified as a “top priority for future research” (Cropanzano et al., 2005). Our study empirically explores how employment equity influences organizational justice and employee work behaviors in South Africa. Using multilevel analysis to account for hierarchical data structure, data on company as well as employee level are collected. As such, the study promises both important theoretical insights for justice research as well as unique practical relevance for South African companies.
A TEST OF DEVIANCE REGULATION THEORY IN INTERGROUP CONTEXT: INTENTION TO PROTEST AGAINST GENDER INEQUALITY

Canay Doğulu, Middle East Technical University, Ankara - Turkey

The aim of this study was to experimentally investigate whether the main principle of Deviance Regulation Theory (DRT) that deviation from reference group norms in desirable ways contributes to maintenance of meaningful identities (Blanton & Christie, 2003) operates in a decision context concerning an intergroup behavior, namely, engagement in protests against gender inequality. It was investigated whether the interplay between descriptive and injunctive behavioral norms (DN and IN, respectively) reflected a deviation regulation pattern to predict higher levels of intention and how DN and IN of different reference groups interacted with gender to predict the highest levels of intention to protest. A total of 276 university students participated in the current study. A 2 (Gender: female vs. male) X 4 (Behavioral DN and IN: protesting-protesting vs. protesting-not protesting vs. not protesting-protesting vs. not protesting-not protesting) X 3 (Reference group: people vs. women vs. men) mixed analysis of covariance with repeated measures on the last factor was conducted on intention to test the main and interaction effects after controlling for gender-specific system justification and past protest behavior. The results revealed a main effect of gender and an interaction effect of behavioral norms and reference group. Though the findings did not provide support for DRT, they might have implications for encouraging public response to gender inequality via protest behavior.

FACEBOOK ORIENTATION AND BEHAVIORAL PATTERNS: THE ROLE OF ADULT ATTACHMENT STYLE

C09. Culture and society - Media and communication

Eldad Rom, College of Management, College, Rishon LeZion - Israel

In the current series of studies we apply attachment theory as a relevant framework for understanding cognitive orientation, as well as behavioral patterns on what is presently considered as the most popular SNS (social network site) - "Facebook". Numerous studies have demonstrated that attachment tendencies are significantly associated with quality of close relationships and daily social interactions. Since today virtual communication and social networks are capturing dominant aspects of social relationships, the linkage to attachment theory is evident. We conducted two studies among Israeli young adults. At the first study we asked participants to share with us their habits and daily routines on Facebook. We also measured their cognition and emotion concerning Facebook. On the second study, we actually monitored participants' behavioral patterns on Facebook. Results show that attachment insecurity is associated with global orientations and emotions towards Facebook and that people develop attachment relationships with their Facebook network. We also found that attachment insecurity can predict actual behavioral patterns.
This ethnographic study explores the ways in which two English language learners appropriate the linguistic features of English by engaging in a complex identity construction on Twitter. Data consisted of 4,504 Twitter posts captured from the participants’ Twitter pages, interviews, and online observations. Data analyses included coding and querying strategies using a qualitative data analysis software, NVivo 10. Informed by sociocultural approaches to language development (Lantolf, 2000; Rogoff, 1995) and Goffman’s performative theory of identity (1959; 1981), this study finds that identity construction and negotiation are central to the development of the participants’ linguistic repertoire of English. As they participated in social activities, the participants discursively constructed and negotiated their identities vis-à-vis their multiple online communities. Yet in this process, they also began to appropriate the lexical, syntactical, and discoursal features of their communities, which in turn expanded their understanding of the language. What is unique about their social participation is that their expanding linguistic repertoire was mediated less by the direct/mutual participation of their online community—as traditionally framed in the literature—but more by the participants’ ‘single-handed’ practice to transform their past textual experiences. As such, this study demonstrates the transformative nature of social media in redefining social activity and contributes to new conceptual directions for understanding second language learning mediated by digital technologies. This study also has implications for educators who seek new ways to promote life-long learning to their digital-native students.
O1236
THE AGREEMENT WITH CLIMATE CHANGE POLICIES: FRAMING THE FUTURE AND NATIONAL VERSUS EUROPEAN IDENTITY

F11. EXPO 2015 Hot Topics - Environment and sustainability

Mauro Bertolotti, Catholic University of Milan, Milan - Italy
Patrizia Catellani, Catholic University of Milan, Milan – Italy

Citizens often find it hard to accept climate change policies, due to their complexity and the temporal distance between their adoption and their planned outcomes. Uncertainty regarding the political actors responsible for their adoption, either national governments or international organisations (e.g., the EU), may also hinder the persuasiveness of these policies. In our research, we analysed how message framing and focus on a national vs. international actor affected agreement with investment in renewable energy sources. Participants from a nation-wide survey (N = 3244) were presented with different versions of a prefactual statement supporting the policy, manipulated as to its focus on the consequences of adoption vs. non-adoption, its growth vs. safety concern, and the actor responsible for the policy (Italy vs. the EU). Results showed that participants’ agreement was higher when the statement highlighted the positive growth-related consequences of adoption than when it highlighted the positive safety-related consequences, or the negative consequences of non-adoption. Participants with a European identity were most sensitive to such “fitting” frame when the statement attributed policy implementation to Europe, whereas no differences were found when it attributed policy implementation to Italy. Discussion focuses on how results may contribute to current psychosocial research on message framing and to the development of effective communication on climate change policies.
Variables related to the process of change in women involved in psychologically abusive relationships

C03. Culture and society - Sex and gender

Mariá José Tenorio, Complutense University of Madrid, Madrid - Spain
Carolina Marín, Complutense University of Madrid, Madrid - Spain
Manuel R. Abuín, Complutense University of Madrid, Madrid - Spain

Despite the legal and institutional measures taken, the number of women who suffer intimate partner violence (IPV) increase every year in Spain. A descriptive, correlational and processual study focused on psychological abuse was carried out in Madrid and the results obtained are presented in this paper. Transtheoretical Model, Traumatic Bonding Theory, Investment Theory, and Implicit Memory Theories are the theoretical framework. Variables as locus of control, self-esteem, clinical symptoms, and interpersonal entailment types were measured to analyze the relationship between them and the different stages of the process of change. Our main goal was to develop a method that lead us to understand more in depth the cognitions and behaviors which define each stage and so, to identify the turning points that trigger the transition from one stage to another. Significant relationships among variables were found depending on the stage of change. The combination of some variables conducted to the differences in the ability of the women to pass from one stage to another; the Incidental Memory Task revealed different results to the ones obtained when applying the questionnaires, highlighting women when they have to describe their process, sometimes think they are in stages in which really they are not. We hope the findings of our study will contribute to design specific intervention protocols for each of the stages in which women are when they are trying to get out of a IPV situation and, thereby, to create more effective and efficient therapies.
Level of adjustment is the first index to check mental health. The aim of this study was developing a valid and reliable Multidimensional Adjustment Scale (MAS). The sample consisted of 150 college students. Multidimensional adjustment scale and Depression, Anxiety, and stress scale (DASS) were used in this study. Principle factor analysis, Pearson correlation coefficient, and Cornbach's Alpha were used to check the validity and reliability of the MAS. Principle component factor analysis showed a 5 factor solution for the MAS. Alpha coefficients for the MAS subscales were ranged between .69 to .83. Test-retest reliability for MAS was .88 and the mean of subscales- total score correlation was .88. All these indexes revealed an acceptable reliability and validity for the MAS. The MAS is a short assessment instrument with good acceptable psychometric properties to use in clinical filed. Key words: Psychological adjustment, Psychometric Properties
Psychological nano-therapy is a new method based on systems theory. According to the theory, systems with severe dysfunctions are resistant to changes. Psychological nano-therapy helps the therapists to break this ice. Two key concepts in psychological nano-therapy are nano-functions and nano-behaviors. The most important step in psychological nano-therapy in family therapy is selecting the most effective nano-function and nano-behavior. The aim of this study was to check the effectiveness of psychological nano-therapy for family therapy. One group pre-test-post-test design (quasi-experimental Design) was applied for research. The sample consisted of ten families with severe marital conflict. The important character of these families was resistance for participating in family therapy. In this study, sending respectful (nano-function) text massages (nano-behavior) with cell phone were applied as a treatment. Cohesion/respect subscale from self-report family processes scale and family readiness for therapy scale were used to assess all family members in pre-test and post-test. In this study, one of family members was asked to send a respectful text massage to other family members every day for a week. The content of the text massages were selected and checked by therapist. To compare the scores of families in pre-test and post-test paired sample t-test was used. The results of the test showed significant differences in both cohesion/respect score and family readiness for therapy between per-test and post-test. The results revealed that these families have found a better atmosphere for participation in a complete family therapy program. Indeed, this study showed that psychological nano-therapy is an effective method to make family readiness for therapy.
O1249  
THE EFFECT OF COPING STRATEGIES ON INDIVIDUAL AND ORGANIZATIONAL OUTCOME PERCEPTIONS: MEDIATING ROLE OF WORK ATTACHMENT STYLES

D16. Work and organization – Other

Reyhan Bilgiç, Middle East Technical University, Ankara – Turkey
Önder Ersen, Arkas, Company, Istanbul – Turkey

The purpose of the present study is to examine the relationship between proactive and preventive coping styles and some individual and organizational outcomes, namely professional self-esteem, job satisfaction, task performance, and organizational citizenship behavior. Moreover, the mediating roles of two employee attachment styles, engagement and burnout were investigated. Psychometric qualities of the scales were established through a pilot study by collecting data from 90 employees coming from different sectors. More data were collected from additional 125 employees. Altogether, 215 employees participated in the present study. Of the participants, 114 were women (53%) and 101 were men (47%). Results showed that proactive coping skills predicted organizational outcomes positively (i.e. professional self-esteem, job performance, job satisfaction, and organizational citizenship behavior). The preventive coping style did not predict any of the outcomes. Mediational analysis showed that engagement mediated the relationship between proactive coping skills and outcomes of work attachment styles, except for organizational citizenship behavior but burnout did not mediate preventive coping and outcomes of work attachment styles. The results were discussed and implications for the managers were mentioned. Some future research themes were suggested, and limitations of the study were listed. Keywords: Proactive coping, preventive coping, work attachment styles, organizational outcomes
AGGRESSION, GUILT, AND CONDUCT DISORDER IN IMMIGRANT ADOLESCENTS: THE ROLE OF PARENTING STYLE AND EGO IDENTITY

C02. Culture and society - Family systems and processes

Ricky Finzi-Dottan, Bar Ilan University, Ramat Gan – Israel

The study examined aggressive behaviors in adolescent immigrants from former USSR. These adolescents face the complex task of forming their identity while having to adjust to a new culture. Meanwhile, studies have shown that their parents tend to use control and harsh punishment in their parenting methods. These adolescents are thus at greater risk of psychological distress and more prone to identify with socially deviant peer-groups, resulting in the dramatic increase in crime level found among them. Method: Sixty nine immigrants adolescents and 50 native Israelis from residential schools completed questionnaires assessing level of aggression, hostility and sense of guilt, ego identity, and parenting style. Objective assessments of conduct disorders were obtained from instructors at the residential schools using the CBCL. Results: Congruency was found between adolescents’ self-reports and objective assessments of conduct disorder as reported by their instructors. Findings indicated that diffused ego identity was the strongest predictor of aggressive behavior (adolescents’ self-report), and the variable most affecting conduct disorders in the immigrant group (as reported by the instructors at the residential schools). Harsh punitive parenting methods strengthened the link between diffused ego identity and aggressive behavior, while “positive parenting” promoted a sense of guilt, especially in the immigrant group. These results warrant ethnic-sensitive interventions.
**O1255**

**PATIENT-CENTRIC MODEL FOR TREATMENT OF CHILDREN WITH AUTISM SPECTRUM DISORDERS: THE MICHELANGELO PROJECT**

B14. Development and education - Developmental disorders in health

Antonio Narzisi, IRCCS Stella Maris Foundation, Pisa (Calambrone) - Italy
Lucia Billeci, University Pierre et Marie Curie, Paris - Italy
Chiara Lucentini, IRCCS Stella Maris Foundation, Pisa (Calambrone) - Italy
Francesca Fulceri, IRCCS Stella Maris Foundation, Pisa (Calambrone) - Italy
David Cohen, University Pierre et Marie Curie, Paris - France
Filippo Muratori, IRCCS Stella Maris Foundation, Pisa (Calambrone) - Italy

Background: The MICHELANGELO project intends to develop a patient-centric intervention for children with autism spectrum disorders (ASD). Objectives: (1) to demonstrate the usefulness of Information Communication Technology (ICT) in the rehabilitation of children with ASD; (2) to appreciate the contribution of ICT tools in terms of easy at-home use. Methods: 20 children were recruited. They were: Experimental and Control groups. The Control group were not gone through the training sessions. Training session were organized in: (a) one-to-one clinical session (based on imitation and joint attention) at hospital; (b) serious game session, via tablet, both at hospital and at home. Results: An observation room and a semi-naturalistic protocol based on imitation and joint attention tasks, during which EEG and ECG data were developed. To follow a naturalistic philosophy a wireless EEG system has been used. Its active digital electrodes digitize the signal on site in order to reduce environmental noise and wireless communication while recording data away from the lab or controlled environments. Conclusions: It has been observed that young children accepted the EEG cap and the protocol. The interaction with the examiner is very important for recreating a more real situation with social interactions and cues. In this situation we can suppose that the signals acquired from the brain, are much more similar to that generated while the child interact in common life situations.
O1257
THE EFFECTS OF ELECTRONIC TEXT CONTRAST POLARITIES AND COLOR COMBINATION PATTERNS ON READER’S VISUAL FATIGUE

A07. General issues and basic processes - Sensation, perception and space

Aiping Wang, Beijing Normal University, Beijing - China

The study explored the effects of text-background presentation patterns of electronic linear and guided text on reader’s visual fatigue in two experiments, both employing the methods of eye tracking and questionnaire survey. Experiment 1 focused on electronic linear text. It showed that the color patterns of yellow text on black background, green text on black background, and black text on green background resulted in significantly lower visual fatigue than other color combinations. It also showed that there was not significantly different visual fatigue between positive and negative contrast polarities in the electronic linear text, albeit readers typically preferred positive polarity over the negative one. Experiment 2 focused on electronic guided text. The result showed that in the condition the different color patterns did not caused significantly different visual fatigue levels. On the other hand, contrast polarities played a significant role in reader’s visual fatigue, though, yet again, readers exhibited a preference for positive polarity over the negative one. The conclusion is that the color patterns and contrast polarities’ effects on visual fatigue are different for the electronic linear text and for the electronic guided text. When linear text is concerned, color patterns played a significant role in visual fatigue, whereas for guided text, contrast polarities were more important. For both types of text, readers showed a preference for positive contrast polarity over the negative one.
O1258
THE EFFECT OF THE PRESENTATION ORDER OF UYGHUR-CHINESE PHRASE AND SENTENCE ON UYGHUR READERS’ READING ACTIVITIES

A10. General issues and basic processes - Language and communication

Aiping Wang, Beijing Normal University, Beijing - China

The present study examined the effect of different orders of phrase and sentence on Uyghur-Chinese bilinguals’ reading speed. The results showed (1) The speed of processing Uyghur phrases was faster than Chinese phrases on phrase level. The speed of reading correct order phrases was faster than reading reverse order phrases. In the light of processing speed, the reading speed of Uyghur phrase with correct order was fastest; the second was Uyghur phrase’s one with reverse order; the third was Chinese phrase’s one with correct order; the forth was Chinese phrase’s one with reverse order. (2) There wasn’t difference between processing speed of Uyghur and Chinese sentences on sentence level, but the speed of reading correct order sentences was faster than reading reverse order sentences. According to processing speed, the processing Uyghur sentence with correct presenting order was fastest; the second was Chinese sentence with correct order; the third was Chinese sentence with correct presenting order; the forth was Uyghur sentence with reverse presenting order. The conclusion was there were different effects between reading orders of phrase and sentence with different languages on reading speed.
The challenges of today world such as pluralism, respecting “the other”, having world-mindedness, being patient and responsible citizen and so on, remind us the necessity of emotional literacy. In other words, emotional literacy is a critical educational policy to enhance psychological well-being and adjustment. In emotional education field emphasis on abilities which are related to emotional intelligence would be an effective opportunity for getting to know "the other" and social cognition attainment. According to ability model of Mayer and Salovey's four components of EI including: 1) Perception and identification of emotion, 2) Use of emotion, 3) Understanding of emotion and 4) Management of emotion; 9 textbooks (literature, religious education and history) of secondary school (3 grades) in Iran were analyzed. In analyzing, all parts of lessons including words, sentences, questions, exercises and images were investigated in order to make clear their emotional messages and to what degree they deal with emotional intelligence components. Findings indicated that textbooks had emotional messages, but not in systematic and purposeful manner to foster EI. Out of three studied fields, literature had more contribution for EI education, whereas the contribution of history was not considerable. History textbooks were confined only to description of historical events. It seems that the degree of attention to emotions and abilities of EI is affected by one way emphasis of education system on cognitive goals, in addition to the cultural musts and values. On the other hand, the newness of EI education in education theorizing and policy making could also be considered when dealing with emotional literacy.

DISCOVERING THE RELATIVE STRENGTHS OF IMAGINED AND ELECTRONIC CONTACT STRATEGIES IN IMPROVING INTERGROUP RELATIONS ACROSS TWO COUNTRIES

C08. Culture and society - Prejudice and social exclusion

Fiona White, University of Sydney, Sydney - Australia
Rhiannon Turner, Queen’s University Belfast, Belfast - United Kingdom
Lauren Harvey, University of Sydney, Sydney - Australia
Jeff Hanna, University of Sydney, Sydney - Australia

This study is the first to investigate the relative strengths of two contact strategies, Electronic(E)-contact and imagined contact, in improving intergroup relations in Australia and Northern Ireland. Whereas imagined contact involves participants engaging in a positive imagined interaction with an outgroup member, E-contact is a computer mediated contact where ingroup and outgroup members never physically meet but engage in a synchronous interaction which is mediated by online technology. This cross-national experimental study randomly assigned participants to either an E-contact, imagined contact, or control condition. Participants then completed measures of intergroup attitudes, behavioural intentions, anxiety and trust. In order examine the efficacy of the contact approaches across different national and intergroup contexts, Study 1 involved Anglo-Australian participants with Muslims as the target outgroup, whilst Study 2 involved Catholic and Protestant participants, with the opposing community as the target outgroup. As predicted, both contact interventions improved intergroup relations relative to the control conditions, although E-contact was more efficacious on certain measures. Important systematic differences also emerged on the basis of national context and the outgroup target. Implications of these differences in contact strategies for effectively reducing prejudice and improving intergroup relations across different cultural contexts are discussed.
O1262
THE INTERNAL/EXTERNAL FRAME OF REFERENCE MODEL OF SELF-CONCEPT IN READING, MATH, AND SCIENCE

A11. General issues and basic processes - Motivation and emotion

Yuwen Chang, National Taipei University of Education, Taipei - Taiwan, Province of China

The purpose of this study was to evaluate the internal/external frame of reference (I/E) model of academic self-concept in three domains of Taiwan primary students. Based on the external and internal comparisons, the I/E model posits that negative path of achievement in one domain (e.g. Math) on self-concept in another domain (e.g. Verbal). The I/E model has been studied almost exclusively for the math and native language domains. There were inconsistent results from the juxtaposition of mathematics and science for the I/E model. Utilizing the TIMSS and PIRLS 2011 data from Taiwan, this study examines the generalizability of the I/E model extended to three domains: reading, math, and science with primary student (N=4265). The model fit was satisfactory (fit indices $\chi^2=1840.98$, df=134, $p<.001$, NNFI=.98, CFI=.98, RMSEA=.057). As predicted by the model, achievement in all domains positively predicted the corresponding self-concepts (path coefficients of .19 to .42). Interestingly, only achievement in reading had a negative impact on self-concept in math (-.17) and no other significant negative effects emerged. Whereas, positive paths were found from science achievement to reading and math self-concept. The findings contrasted with the typical I/E hypothesis that achievement in one subject reducing self-concept in the other. The author suspects that the primary students in Taiwan may consider math competence as a sign of general intelligence.
O1264
THE EFFECTIVENESS OF ACCEPTANCE-COMMITMENT THERAPY ON ANXIETY AND DEPRESSION OF PATIENTS ON METHADONE MAINTENANCE TREATMENT

E05. Health and clinical intervention - Evidence based psychotherapies

Amir Rezaei Ardani, Mashhad University of Medical Sciences, Ebn-e-Sina hospital, Mashhad – Iran
Leila Darabi Mahboub, Mashhad University of Medical Sciences, Ebn-e-Sina hospital, Mashhad – Iran
Sara Shahriari, Mashhad University of Medical Sciences, Ebn-e-Sina hospital, Mashhad – Iran
Navid Nourizadeh, Mashhad University of Medical Sciences, Ebn-e-Sina hospital, Mashhad – Iran
Mozhgan Saedy, Mashhad University of Medical Sciences, Ebn-e-Sina hospital, Mashhad – Iran

Introduction: This study evaluated the effectiveness of ACT on anxiety and depression in opioid dependent patients under MMT. Material and Methods: The present study was done in Mashhad, Northeast of Iran, during 2011-2012. Twenty eight opioid dependent patients, aged 18-50, who were under MMT were selected using purposive sampling method and were divided equally in to case and control groups. The case group received 8 sessions of individual ACT. Level of depression and anxiety of patients were measured using Beck Depression Inventory-II and Beck Anxiety Inventory before the initiation of ACT as pretest, 2 weeks after the termination of ACT as post-test and three months after it as follow-up. The collected data was analyzed with SPSS-14, using ANOVA and repeated measurements. Results: The pretest-post test-follow up of anxiety showed no significant difference between two groups (P=0.05); however, the case group had lower depression scores in post-test and follow-up than the control group (P=0.04). Evaluating the results of case group revealed that depression significantly decreased in post-test in comparison to pretest (P=0.01), while there were not significant decrease in follow up in comparison to pretest (P=0.34). Conclusion: Short term of ACT in patients under MMT is not associated with a significant decrease in level of anxiety; however, it is associated with a significant decrease in level of depression. Nonetheless, this reduction was not maintained in the long term.
O1267
THE RELATIONSHIP BETWEEN SLEEP DURATION AND GLUCOSE CHALLENGE TEST RESULTS IN PREGNANT WOMEN WITHOUT RISK FACTORS OF DIABETES

E18. Health and clinical intervention - Psychosomatics and clinical psychophysiology

Sara Shahriari, Mashhad University of Medical Sciences, Emam Reza Hospital, Mashhad - Iran
Leila Darabi Mahboub, Mashhad University of Medical Sciences, Mashhad - Iran
Amir Rezaei Ardani, Mashhad University of Medical Sciences, Ebn-e-Sina Hospital, Mashhad - Iran
Navid Nourizadeh, Mashhad University of Medical Sciences, Emam Reza Hospital, Mashhad - Iran
Nafiseh Jahanpak, Mashhad University of Medical Sciences, Mashhad - Iran

Introduction: Sleep disturbances during pregnancy are prevalent due to physical and hormonal changes. There is little information about association between insufficient sleep and glucose metabolism during pregnancy. So, this study was done to investigate the relationship between sleep duration and results of glucose challenge test in pregnancy. Methods: This descriptive-analytical study was conducted on 177 pregnant women in Mashhad city, Northeast of Iran in 2012. Participants were selected through available sampling method. The two groups were matched for depression and anxiety levels. Sleep duration of participants during 26-30 weeks of pregnancy was recorded by Pittsburgh sleep quality index, then they underwent glucose challenge test. Short sleep duration was defined as less than 7 hours of sleep/night. Collected data were analyzed by Pearson correlation and chi-square tests using SPSS-11.5. Results: 49.2% of participants had short sleep duration. There was a significant inverse correlation between sleep duration and results of glucose challenge test (r=-0.19, p=0.01). Impaired glucose challenge test was significantly more prevalent in participants with short sleep duration (p=0.01). Conclusion: Short sleep duration is associated with impaired glucose metabolism in pregnancy. So, it is important for health providers to consider sleep disorders in pregnant women.
O1273

REACTIVE AND PROACTIVE AGGRESSION: FACTOR STRUCTURE, RESEARCH AND CLINICAL IMPLICATIONS

A03. General issues and basic processes – Psychometrics

Rebecca Ang, Nanyang Technological University, Singapore – Singapore
Xiang Li, Nanyang Technological University, Singapore – Singapore
Wei Teng Chan, Nanyang Technological University, Singapore – Singapore
Vivien Huan, Nanyang Technological University, Singapore – Singapore

Objectives, Theory and Contribution: This study investigates the factor structure of the Reactive-Proactive Aggression Questionnaire (RPQ). Traditionally, researchers have focused on forms of aggression (e.g., physical, verbal) and more recently, researchers have investigated functions of aggression such as reactive and proactive aggression. The theorized 2-factor model of reactive and proactive aggression has been debated in the field. Such research is crucial because it has theoretical and clinical implications. Reactive aggression is enacted after provocation, and is based on the premise of the frustration-anger theory of aggression. Proactive aggression is deliberate, done in pursuit of instrumental gain, and is developed through the social learning model of aggression. Methods: The sample comprised 1027 adolescents in Singapore (576 male, 414 female) from Grades 7-9 with a mean age of 14.10 years. Confirmatory factor analysis (CFA) and multigroup confirmatory analysis (MGCFA) were performed on the 23-item RPQ to examine the 2-factor structure for reactive and proactive aggression and invariance across gender was examined. Results: CFA results provided support for the 2-factor structure of reactive and proactive aggression, with a Satorra-Bentler scaled $\chi^2(229, N = 1027) = 851.64, p < .05$, and robust statistics with a CFI of .97, IFI of .97, NNFI of .97, and a RMSEA of .05. Given Cheung and Rensvold’s (2002) recommendation of decreases in CFI of .01 or less as indicators of invariance, results suggested measurement invariance of form, factor loadings, variances and covariances across gender. Cronbach alpha for reactive and proactive aggression were good at .82 and .87 respectively. Conclusion and Implications: There is theoretical and empirical support for the two factor reactive-proactive aggression typology. RPQ was initially developed and validated for use with adolescents in the USA. This extends the validation work cross-culturally. Given that reactive and proactive aggression are distinct constructs, these results also have clinical and intervention implications.
O1277
THE MEDIATOR ROLE OF SELF-DETERMINED BEHAVIOR ON THE RELATIONSHIP BETWEEN AUTHENTICITY AND WELL-BEING

E09. Health and clinical intervention - Positivity and well-being

Burcu Korkmaz, Hacettepe University, Ankara - Turkey
Yasemin Oruçlar, Hacettepe University, Ankara – Turkey

The main purpose of present study was to assess the relationship between satisfaction of basic needs, authenticity and general well-being. People's motivation, quality of experience and well-being are promoted when acting with authentic interests and values. By contrast, inauthentic actions are often driven by heteronomous forces or ‘introjected’ regulations and thus result in more internal conflict, compromised forms of motivation, and lower well-being (Ryan, LaGuardia, & Rawsthorne, 2005). Research suggests that intrinsically motivated, authentic behaviors can only emerge once primary needs for autonomy and connectedness are satisfied and that the ability to make autonomous, authentic choices free from the domination from others is a pan-cultural requirement for health and happiness (Deci& Ryan, 2000, 2004). In the light of this theoretical background, results of the present study indicated that the satisfaction of basic needs was a full mediator in the relationship between authenticity and well-being. Regarding this finding, authentic behavior is self-determined behavior that is why authenticity predicted well-being by the mediator role of total scores in satisfaction of basic needs. To conclude, findings of the present study imply self-determined needs might be regulatory mechanism of authenticity on well-being.
O1280
DEALING WITH DOMESTIC VIOLENCE: AN INNOVATIVE APPROACH

B08. Development and education - Bullying and aggression

Zipi Hochdorf, Western Galilee College, Acre - Israel

Domestic violence is a widespread concern within the society, despite decades of attempts to prevent and treat it. The common way to deal with the subject are the following: the parallel one - working with the perpetrator and the victim. Group Treatment that was found as highly affective for those who do not dropout. Conjoint Couple Therapy in which problems are corrected and worked out during sessions. Prevention work at schools in order that boys and girls will acquire new ways of close relations and create more equal and respectful relations in families. The purpose of this presentation is to introduce a project of teaching family therapy specially oriented to domestic violence to professionals in Peru. The WHO (2006) found in the Andean Mountains, Peru high rates of domestic violence (40%-60%) and a need of local professionals for knowledge and interventions. The project was held along three years including intensive teaching and practicing, organized by the Universidad Andina del Cusco, an American psychiatrist born in Peru Dr Lleni Pach and the Israeli Head of the project Dr Michal Finkelstien. Lecturers mostly from Israel and also other countries came voluntary to share their knowledge with the local professionals. Findings: Despite cultural differences, language obstacles and strict dates, the project was considered by the participants, as very helpful empowering, inspiring and effective. Discussion: This unique way of dealing with domestic violence might be considered as a way of "helping the helpers" world wide to improve their understanding and interventions used with traumatized violence victims. Key words: Domestic violence, training professionals.
A SYSTEMATIC REVIEW OF CHILD AND ADOLESCENT DECISION MAKING STYLES AND THE ASSOCIATION WITH PARENTING APPROACHES

A13. General issues and basic processes - Thought, decision and action

Eugene Lee Davids, University of the Western Cape, Cape Town - South Africa
Nicolette Vanessa Roman, University of the Western Cape, Cape Town - South Africa
Lloyd Leach, University of the Western Cape, Cape Town - South Africa

Research suggests that parenting plays an important role in the social development of children and adolescents; one important outcome of this is decision making. A task that we are faced with on a daily basis, where we need to negotiate the best course of action. Decision making during adolescence is important as it assists with many challenges that are common to this developmental phase. This review examined the associations between decision making styles and parenting approaches. A search was conducted during the month of September 2014 using databases and journals such as Science Direct, Ebscohost (Academic Search Complete, PsycArticles, Medline, SocIndex and ERIC), BioMed Central, PubMed, Directory of Open Access Journal and SAGE Journals for the periods from 2004 to 2014. Three reviewers independently evaluated the methodological quality of the studies reviewed. Six articles met the criteria for the inclusion within the review. These studies included 4 cross-sectional studies and 2 longitudinal studies. Three of the studies were conducted in Europe, 2 in the United States and 1 each respectively in South America and Asia. The age groups of the participants ranged from 7 to 20. The results suggest that there are associations between decision making styles and parenting approaches. Adaptive and maladaptive decision making has been associated with an array of parenting approaches. The review suggests that culture played a role in the associations; however age and gender played no significant role.
For a public recruitment examination with changing items to measure general abilities, it is usual to need to develop its optimal short form to match a specific position qualification profile so as to improve its selection accuracy. But an optimal short-form may be changeable due to its changing test items and candidate population. The aim of this study is to examine the stability of optimal short-forms of a general ability test at different testing time. The data is the scores of about 40,000 candidates who took the Basic-Abilities Test of Beijing Public Institutions (BATBPI) during the period of 2012-2014. BATBPI is an entrance examination to screen candidates who apply for positions in state-sponsored nonprofit public organizations in Beijing. BATBPI consists of ten subtests for a management or professional position, takes 150 minutes in all, and provides testing three times each year with all renewed items every time. The equivalences of all items from a testing time to another are guaranteed subjectively both by item creators and test assembler. All subtests are provided in general for the same type of positions, but sometimes it is necessary to develop its optimal short form for a candidate of a specific job. According to the principle of error distribution, different short forms of BATBPI are compared with parameters. Using different data sets BATBPI is found to be composed of one or two common factors based on principle component analysis. Eight short forms were created for a data set of each testing, and the number of their subtests increased respectively from 2 to 9 based on their factor loadings. Given the distribution of score errors between the full form and its short forms, the probabilities of $\alpha$ error and $\beta$ error, the power of statistical test, and the covering percentage of candidates were calculated for each short form in the condition of the maximum score dispersion among its subtests. It is found that the optimal short form usually consisted of four subtests, though it differs slightly in its number and components of subtests from a testing time to another. It concludes that an optimal short form is basically stable for a general abilities test with changing items in the case that its item difficulties are comparable.
O1283
COGNITIVE BEHAVIORAL MODEL OF COMPULSIVE HOARDING: A FURTHER TEST IN A TURKISH COMMUNITY SAMPLE

E02. Health and clinical intervention – Psychodiagnosis

Orcun Yorulmaz, Dokuz Eylul University, Izmir - Turkey
Nilufer Demirhan, Uludağ University, Bursa - Turkey

As a tendency of acquisition and failure to discard possessions, compulsive hoarding is described in a separate category in DSM-V. Empirical research supported the cognitive-behavioral model of compulsive hoarding which assigns critical roles for attachment to possessions, information processing deficits, faulty beliefs, discomfort and avoidance behaviors; however, this model needs cross-cultural verification in different cultures, including Turkey. Thus, the present study aimed to explore these factors in a nonclinical community sample. Four hundred sixty eight participants completed self-report instruments on attachment to possessions, obsessive beliefs, ways of coping and compulsive hoarding. The analyses of correlation showed that hoarding symptoms were positively associated with attachment to possessions, three OCD specific belief domains, and being reserved, avoidance, acceptance and superstition as strategies of coping, while coping of planned behavior was negatively related. The results of logistic regression based on classification of subjects further verified the distinguishing role of attachment, importance/control of thoughts, planned behavior and avoidance. The results of these analyses indicated that higher sensitivity on attachment to possessions, importance/control of thoughts and more use of avoidance, but at the same time, low preference of planned behavior (i.e., a possible link to impulsivity) are associated with hoarding behavior. It seems that connection with belongings, some faulty beliefs and problematic ways of coping are critical factors for hoarding behavior, and this situation provides a further support for cognitive explanation in different cultural context.

MEN, WOMEN, AND THEIR CARS: DIFFERENCES IN ROAD SAFETY AND MOBILITY

C03. Culture and society - Sex and gender

Reut Sadia, Technion - Israel Institute of Technology, Haifa - Israel
Shlomo Bekhor, Technion - Israel Institute of Technology, Haifa – Israel
Polus Abishai, Technion - Israel Institute of Technology, Haifa – Israel

Female sex abuse (FSA) has recently emerged as an object of enquiry in the academy and medico-legal systems both globally and in South Africa. However, the academic research is primarily focused on perpetrators, resulting in very limited information on its victims. Victim data that are available are based mainly on studies conducted with perpetrators. FSA victimhood is underexplored and many victims remain invisible to the criminal justice and health systems and are barely discernible as objects of human science knowledge. Despite the accent on vulnerable populations and human rights in the contemporary world, there is very little work on precisely why these victims remain invisible. Accordingly, this research aims to identify the cultural conditions of possibility for FSA victimhood as a means to advance contemporary critical understandings of the role of gender and sexuality as instrument-effects of modern power. The study’s objectives were achieved by interviewing persons who self-identified as FSA victims. A Foucauldian informed discourse analysis was employed to interpret the transcriptions of these interviews and to explore conditions of possibility for FSA victimhood as they were constructed in the interview context. The findings illustrate precisely how deeply engrained constructions of gender and sexuality both produce and constrain the possibilities for reporting, disclosing and self-identifying victimhood. Overall, a particular configuration of access to non-normative psychological, gender and ‘sex’ discourses mostly mediated by the internet and incited through the confessional context of the interview provides the possibilities for an identification as a victim of female sex abuse. These points of identification are coordinates for disrupting normative understandings of gender, sexuality and power in sex abuse and thus constitute the beginnings of a counter-knowledge on transgressive sexualities. This counter-knowledge will further contribute to critical accounts of the way that power/knowledge produces, reifies and naturalises human subjects through technologies of sexuality. Keywords: Female sex abuse; female sexual perpetrations; sexual abuse victims; sexuality; gender; power; discourse; discourse analysis; South Africa.
Start-up: In our field of work there’s a slow cultivation of technologies. Due to our work we have to develop a new area in apps (and e-health). Although chatting and e-mails are outdated. In this presentation I’ll guide you through a new version of software package: P-APP : is this like new new in E-health. Underpinning: E-health is a Hot Topic: This sound is clear and loud. In our field of activity we have to persist in these activities. Obviously it’s a significant addition to face-to-face contact. But we have to move faster en switch even quicker, than we do right now. It fits into today's society. Major Point: How does an app work and how do we use it in our practice. The emphasize is on education. What are the benefits of using an app. In my opinion we should quickly adapt to the use of an app, because of the needs of the patient into this digital epoch. Conclusion: In our field we have to move quicker en faster. Believe me there are people who even don’t have a website, or don’t know how to use e-mail, or something like that. It’s necessary. If we want to develop ourselves and our work, we have to! By introducing this abstract (the use of an app) I want to enthuse and motivate everybody to work with Face-to-face treatment and using my app. It’s necessary to integrate those two. And last but not least it’s also very special for ourselves. It’s a benefit for the client and for the psychologist himself. Reflection on theoretical, methodological, and ethical implications: At the moment there are no theoretical reflections of using an app. We are the first Practice in the Netherlands. Although there are implications of how to use E-health.
O1291
PERCEIVED DISCRIMINATION AMONG CHINESE RURAL-TO-URBAN MIGRANT ADOLESCENTS

B09. Development and education - Adolescent adjustment

Shiyu Zhang, Utrecht University, Utrecht - Netherlands
Qian Wang, The Chinese University of Hong Kong, Hong Kong - Hong Kong

In the past few decades, tens of thousands of Chinese children move from villages to cities where their parents hold low-status and low-pay jobs. The rural-to-urban migrant families often experience discrimination, putting their well-being at risk. This research studied such experience among 455 Chinese rural-to-urban migrant adolescents (169 girls; Mage=13.11 years, SD=.79). Adolescents self-reported on well-being (WB; life satisfaction, self-esteem and depression-reverse-keyed), perceived group discrimination (PGD; how they believed that children of rural-to-urban migrant workers as a group were generally discriminated), perceived personal discrimination (PPD; how they believed that they themselves as individuals were specifically discriminated) and imaginary audience (IA; the extent to which they believed that others were always evaluating them). It was found that 1) the greater students’ PPD, the poorer their WB, β=-.40, while this link was stronger when students’ PGD was relatively low (1SD below the mean; β=-.53) than when their PGD was relatively high (1SD above the mean; β=-.27), β=.15 for the interaction effect; 2) the greater students’ PGD, the greater their PPD, β=.59, while this link was stronger when students’ IA was relatively high (β=.67) than when their IA was relatively low (β=.50), β=.09 for the interaction effect; ps=.036 to <.001. The findings suggest the dynamics of PPD and PGD in relation to WB and the moderating role of IA in the link from PGD to PPD.
This study aims at examining parenting beliefs about shy children. It is assumed that parents' beliefs about children's development play a significant role in guiding their responses to child behaviour. It is also acknowledged that shyness is a culturally bound construct. More specifically, this study makes an attempt to investigate the way Greek parents perceive shyness and its components, as well as their causal attributions among other variables. A sample of 107 parents in Rhodes (Greece) were administered a questionnaire designed to assess parental beliefs about shyness. Research data show that the majority of the sample perceive shyness as a lack of sociability and social initiatives. Introversion, fear of rejection, inhibition and passiveness are also included in their conceptualization of shy children's personality traits. Moreover, the majority thinks that family factors play the most significant role in shyness. They attribute shyness to family factors, such as the limited social life of parents, rejective attitude of parents toward their children, overprotectiveness and parental control. Research findings are discussed in relation to the existing literature about shyness definition and its etiological factors. These findings may reflect cultural differences and contribute to the conceptualization of shyness, as this construct has not been studied in Greek society.
O1295
THE SELF-ASSESSMENT OF THE QUALITY OF LIFE AND WELL-BEING OF CHILDREN WITH AND WITHOUT AN INTELLECTUAL DISABILITY, AGED FROM 5 TO 11 YEARS OLD

E09. Health and clinical intervention - Positivity and well-being

Bacro Fabien, University of Nantes, Nantes - France
Coudronniere Charlotte, University of Nantes, Nantes – France
Guimard Philippe, University of Nantes, Nantes – France

The objective of this study was to validate a self-report scale designed to assess the QOL of children with and without an intellectual disability aged 5 to 11 years old, and to explore potential determinants of their subjective well-being. 187 children aged 5 to 11 years old participated in this study, including 147 children registered in a regular school and 40 children with an intellectual disability registered in School Inclusion Class or specialized institutions. Using the abbreviated form of the Multidimensional Student's Life Satisfaction (Huebner et al, 2012) that we translated into French and adapted for young children and children with an intellectual disability, this seemed particularly relevant to assess their life satisfaction in key areas of life, namely family, friendship, school, self and living environment. The results regarding the French validation of this adaptation of the MSLSS-R are very promising. Indeed, the psychometric properties of the scale were satisfactory and several dimensions of life satisfaction clearly discriminated children according to their age, sex and disability. Finally, differential analyses are planned to highlight inter-individual differences in the well-being of children with and without intellectual disability. These results will also be part of this paper and will be presented orally at the conference.
O1299
STEREOTYPES TOWARDS TURKISH MANAGERS AND EMPLOYEES IN CONTEXT OF ORGANIZATIONAL JUSTICE PERCEPTION

D16. Work and organization - Other

Murat Aydinay, Mersin University, Mersin - Turkey
Unsal Yetim, Mersin University, Mersin - Turkey

One aim of this study is to find out that which stereotypes are developed about Turkish managers and employees, and to investigate differances and similarites between these stereotypes which are reached in consequence of literature review. The other is to investigate relationship between positive and negative stereotypes which developed by managers and employees through each other by perceived organizational justice perception. 65 managers and 143 employees who work in runnings in Mersin, Adana and Istanbul involve into the study as participants. 6 itemed organizational justice scala is presented to particapants in order to measure general organizational perception together with the forms on which they write their demographic information and stereotypes. The research design of 4 (high organizational justice of managers, low organizational justice of managers, high organizational justice of employees, low organizational justice of employees) X 4 (positive stereotypes towards managers, negative stereotypes towards managers, positive stereotypes towards employees, negative stereotypes towards employees) is used in the study. As a result of data analysis, on condition of 5 or more frequency valuation, 58 positive stereotypes and 43 negative stereotypes towards managers, and 46 positive and 36 negative stereotypes towards employees are achieved. Moreover, according to results of analysis of variance (ANOVA) in stereotypes and organizational justice perception relationship when justice perception of managers is high, they develop more positive stereotypes towards managers, and when justice perception of employees is low, they mostly develop negative stereotypes towards managers. Key Words: Stereotype, Turkish Manager, Turkish Employee, Organizational Justice Perception

MOTHER-DAUGHTER RELATIONSHIP AND DAUGHTER’S BODY IMAGE

E09. Health and clinical intervention - Positivity and well-being

Vered Shenaar-Golan, Tel Hai Academic College, Kiyat Shemona - Israel
Ofra Walter, Tel Hai Academic College, Kiyat Shemona – Israel

The adolescent years are characterized by emotional upheaval and hormonal and physiological changes that tend to generate tension and conflict between girls and their parents. (1) This research study is based on an analysis of the mother-adolescent daughter relationship within 46 mother-daughter dyads. This qualitative research assessed the effect of the daughter's body image (independent variable) and her view of her relationship with her mother (independent variable) on her sense of wellbeing (dependent variable). The study used six tools to evaluate the mother and daughter dyads: a demographic questionnaire; the Body Mass Index (BMI); the Modified Gray's Questionnaire (Body Image); the Leisure Time Exercise Questionnaire (LTEQ); the Mental Health Inventory (MHI) for the measurement of subjective sense of wellbeing; and The Relationship with Mother Questionnaire. Our findings show the centrality of the mother-daughter relationship to the daughter's body image and wellbeing, as well as the importance of the adolescent girl's positive body image to her sense of wellbeing. Keywords: body image; subjective wellbeing; adolescent; mother-daughter relationship. Introduction: We live in a society that promotes certain standards of beauty, and children are exposed to these from an early age. These standards influence our social status and our emotional state (Te’omim, 2006). Deviation from modern society's conventional ideal of beauty may lead to a decline in self-worth and a negative body image, and may be detrimental to a person's general sense of wellbeing (Van Den Berg, Keery, Eisenberg, & Neumark-Sztainer, 2010). Prominent among body image concerns is dissatisfaction with one's weight and body shape, especially among adolescent girls. Body image emerges as a significant factor associated with health and wellbeing during this developmental phase, as young people begin to focus more on their physical appearance. How adolescents formulate and define their body image ideals and subsequent self-evaluation is strongly influenced by individual and cultural factors (National Association of Social Workers, 2001; Polivy, Garner, & Garfinkel, 1986), physiological changes (Bearman et al., 2006; Flum, 1995; Moss, 1988), and by their relationship with their parents. The mother-daughter relationship: The mother-daughter relationship plays an important role in relaying a positive or negative body image (Ogden & Steward, 2000). It is considered to be extremely important in the formation of the adolescent girl's perception of herself and her body (Blodgett, Gondoli, Corning, McEnery & Grundy, 2007). Fischer (1991) claims that the mother-daughter relationship is of utmost importance to the female's self-definition; therefore, this relationship should ideally be a positive one (LaSorsa & Fodor, 1990). The mother-daughter relationship strongly influences the formation of the adolescent girl's perception of herself and her body. Mothers can affect their daughters' eating habits, their attitudes toward themselves, and their body image. It has been shown that a mother's conduct alongside her relationship with her daughter, can directly and indirectly impact her daughter's eating habits and body image (Cooley, Toray, Wang & Valdez, 2008). Adolescent wellbeing: Subjective wellbeing (SWB) is defined as “an umbrella term for different valuations that people make regarding their lives, the events happening to them, their body and minds, and circumstances in which they live” (Diener, 2006). An individual's sense of wellbeing influences the way in which he/she copes with distress in difficult life situations and with developmental challenges such as adolescence. Studies have shown that high levels of positive wellbeing serve as a helpful coping factor, since a positive sense of wellbeing stimulates a person's social skills, curiosity and vitality, prompting
him/her to make decisions and even stirring his/her creative thinking. The concept of interpersonal relationships as a primary contributor to wellbeing has been discussed in the professional literature (Agnew & South, 2014; Blyth, Hill, & Thiel, 1982; Cauce, Felmier, & Primavera, 1982; Corsano, Majorano, & Champretavy, 2006; Delfabbro et al., 2011; Offer et al., 1992; Raja, McGee, & Stanton, 1992; Youniss & Smollar, 1985). According to Youniss (1980), relationships and interactions with others stimulate people to develop their own opinions and values. Based on intense and long-lasting affectional bonds, attachment relationships in particular have been found to have a positive effect on self-esteem, body image (Cassidy, 1988) and emotional adjustment (Kenny, Griffiths, & Grossman, 2005; Sroufe, Fox, & Pancake, 1983). Greenberg et al. (1983) examined how attachment is related to wellbeing during adolescence, finding that parental attachment had a greater impact on wellbeing than did peer attachment. In essence, there is a connection between mind and body, as our body contains our emotions, perceptions and memories (McNeur, 2007; Repovš, 2004). Since the body, emotions and the unconscious are inter-related, bodily movement frequently expresses unconscious elements (Balgaonkar, 2010; Mills & Daniluk, 2002), reflecting a person's emotional makeup and their wellbeing. (Haynes-Clark, 2010). The current study will examine the relationship between a mother and her adolescent daughter within the context of the development of the daughter's body image. We will also examine the relationship between the girl's body image and her perception of her own wellbeing. Objectives: This study assesses and examines: (1) The effect of the daughter's body image (independent variable) and her perceived relationship (independent variable) with her mother on her feelings about her own wellbeing (dependent variable). (2) The connection between body image and subjective sense of wellbeing in adolescent girls, and the perceived correlation between them from two points of view: first, as the daughter sees herself; and second, the mother's perception of the way her daughter sees her own body. METHODO This is a quantitative study that assesses the effect of the daughter's body image (independent variable) and her perceived relationship (independent variable) with her mother on her feelings about her own wellbeing (dependent variable). Participants. Forty-six dyads – mothers and their adolescent daughters in Israel - participated in the research, resulting in a total of 92 research participants. The mothers' mean age was 41.1, mean height 164.8, and weight 64.3 kg. Their mean BMI was 23.35, indicating a normal weight and body mass (see table no….). Family status indicated that 82.6% were married or lived with a partner, 4.3% were single (and raised their children alone), 10.9% were divorced, while 2.2% did not fall into any of the specified categories. Research Tools: Six questionnaires were utilized in the research study: (1) Demographic questionnaire (2) Leisure Time Exercise Questionnaire (LTEQ) (Godin & Shepard, 1985) (quantitative variable); (3) Body mass. (BMI = Kg/M2) was used to reflect adiposity (Pietrobelli et al., 1998). (4) Modified Gray's Questionnaire – this questionnaire examines the body image variable. Gray's (1977) questionnaire consists of 12 statements dealing with one's feelings. (5) The subjective sense of wellbeing was measured by the Mental Health Inventory (MHI) questionnaire, compiled by Veit & Ware (1983) and translated into Hebrew by Florian and Drori) (1990. (6) The connection between mother and daughter was examined through the Relationship with Mother Questionnaire (Mayeless & Hai, 1998). This questionnaire's 27 items touch upon various aspects of this relationship. Findings: Various analyses were conducted: a paired sample t-test compared the means of selected variables between mothers and their daughters. This test showed that frequency of physical activity is significantly greater among daughters than among their mothers. Mothers had a higher BMI than their daughters, and their perception regarding their daughters' body image was significantly more positive than their daughters' perception, t(45) = -2.28, p < .05. Daughters' general wellbeing was related to their body image as perceived by their mothers, r(45) = .45, p < .001. Daughters' body image was positively associated with their mothers' general sense of wellbeing, r(46) = .30, p < .05. Finally, the relation between the daughters' rating of their body image and their mothers' rating of their daughters' body image was significantly positive, r(46) = .52, p < .001. A two-way interaction analysis was conducted by performing a regression analysis and including the interaction terms of body image and relations (as perceived by the daughter, centered prior to computation), to predict the daughter's general sense of wellbeing. The regression model was found to be statistically significant, F(3, 42) = 47.14, p < .001, R2 Adj = .75. The Relations variable moderate the impact of body
image on general wellbeing among daughters; as in the event of low body image, a strong mother-daughter relationship yielded a higher level of general wellbeing. Girls who had a positive body image but who had a weak mother-daughter relationship, exhibited a similar level of wellbeing as girls with a strong mother-daughter relationship. Study significance: The current research findings emphasize the importance of the mother-daughter relationship and the mother's emotional support in forging a positive body image on the part of the daughter. They also show that the girl's perception of body image significantly affects her sense of wellbeing. Furthermore, the adolescent girl's positive feeling about her relationship with her mother is an important factor in her positive body image and sense of wellbeing. As we learned from the study, a good relationship with her mother contributed to the daughter's sense of wellbeing even when she harbored negative feelings about her body.
The early maladaptive schemas act as moderators of the predictive association between hopelessness inferences and the development of depressive symptoms in adolescents. We expected that the moderation would be stronger when there is a match in the domain of both cognitive variables (e.g., schemas focused on social relationships and negative inferences about social events). Specifically, the study examines whether disconnection and rejection schemas and other directedness schemas moderate the association between negative inferences about social stressors and depressive symptoms, whereas impaired autonomy and performance schemas moderate the association between negative inferences about achievement stressors and depressive symptoms. The study sample was 982 adolescents (463 girls, 518 boys and one participant who did not respond to this variable) that completed self-report measures of schemas, negative inferences and depressive symptoms at time 1 and time 2 with an interval of 6 months. Results showed that the interactions disconnection and rejection schemas x social inferences, other-directedness schemas x social inferences, disconnection and rejection schemas x achievement inferences and other-directedness schemas x achievement inferences predicted an increase in depressive symptoms at follow-up. These results contribute to understanding the interplay between different cognitive vulnerabilities to depression.

CROSS-CULTURAL DIFFERENCES IN CREATIVITY

C16. Culture and society - Other

Tal Ivancovsky, Haifa University, Haifa - Israel
Simone Shamay-Tsoory, Haifa University, Haifa - Israel
Jenny Kurman, Haifa University, Haifa - Israel

Creativity is a universal cognitive ability (Boden, 2004). Yet, cultural differences in creativity have been repeatedly reported (e.g. Morris & Leung, 2010), in which lower levels of creativity were found in non-Western as compared to Western cultures. In the current study, cross-cultural differences in creativity are explained in the framework of the Twofold Model, according to which creativity involves idea generation and idea evaluation phases (Basadur et al., 1982; Finke et al., 1992). Since in East-Asian cultures uniqueness is discouraged, highly unique ideas are more likely to be inhibited during the “evaluation phase” of the creative process. Two groups were investigated: 40 Israeli students (Western culture) and 40 Korean students (Eastern culture). These groups were compared on their creativity level, in both phases. The creative ability was measured by the "Alternate Uses Task" (AUT; Guilford et al, 1978) and by the "repeated figures of circles" from the Torrance Figural Battery (TTCT, Torrance, 1974). The assessment of the evaluation phase was measured by a new task; evaluation of ideas generated in the AUT by other individuals. Significant differences were found between the groups in the creativity tasks, in which Israelis evincing higher score compared to Koreans. A hypothesized trend was found in the Evaluation task: the Israelis evaluated ideas as more original and the Koreans as more deviant (i.e stringent evaluation style). Thus, Cross-cultural differences in creativity might be derived by differences in the evaluation stringency.

GENDER RELATIONS AND THE CHALLENGES OF DAILY LIFE IN THE CEU: BEING CHILD, BEING A MOTHER, BEING A FATHER

C03. Culture and society - Sex and gender

Sueli Salva, Universidade Federal de Santa Maria, UFSM, Santa Maria – Brazil

This article focuses on the daily lives of parents, students of the Federal University of Santa Maria, who lives in the house of College Student (CEU) with their children. The study "Childhood, Youth and Education: a study of the daily lives of the students 'parents' and the children, their sons and daughters who live in CEU UFSM" which leads this article, is qualitative, longitudinal, constructed from the assumptions of ethnography, started in 2010 and aims to monitor children and teenagers in their daily lives. The aspects that stand out in the investigation relate to the ways in which the students create ways of organizing life to give account of live as fathers or mothers, as students and, sometimes, as workers, also addresses aspects of family arrangements that the womens and their children build and gender relations that permeate the lives of students. These are families with different settings that parents and mothers along with their children or other students building in the CEU. Issues related to gender conceptions interfere either in the form of family organization, child care, and ways of looking at the young men and women in relation to maternity and paternity leave. Keywords: young, maternity / paternity; gender relations; everyday life.
O1312
HOW DOES EXPOSURE TO JEWISH AND MUSLIM SYMBOLS AFFECT OUTGROUP STEREOTYPES?

C08. Culture and society - Prejudice and social exclusion

Lipaz Shamoan-Nir, Zefat Academic College, Safed - Israel
Irene Razpurker-Apfeld, Zefat Academic College, Safed - Israel

Most psychological theories of religion assume that religion plays an important role in intergroup attitudes. Nevertheless, the mechanism of social-cognitive structures and intergroup attitudes has not been sufficiently investigated, especially the process of stereotyping as a consequence of exposure to religious content in a context of tense intergroup relations. We aimed to examine the influence of visually priming religious concepts on out-group stereotypes. Two experiments were conducted, using supraliminal priming. Jews and Arab-Muslim students completed a search puzzle by which they were exposed to religious concepts, and then they filled questionnaires assessing their stereotypes. In Study 1 (N = 156), priming did not affect out-group stereotypes of Jews. However, Muslims perceived Jews as more unpleasant when primed by Jewish symbols, and as more antagonistic when primed by Islamic symbols. Study 2 (N = 110) replicated these findings while ruling out differential familiarity with religious symbols as a possible explanation for the different priming effects for Muslims and Jews. This study highlights the influence of evoked religious content on stereotypes. Being exposed to religious stimuli prompts negative attitudes in a culturally diverse and tense reality, suggesting the impact of minority-majority relations on attitudes towards out-groups. These findings may contribute to an understanding of religious conflicts in an Israeli context as well as in other societies.
O1313
THE EFFECTS OF CHILD ABUSE AND NEGLECT ON PSYCHOPATOLOGICAL SYMPTOMATOLOGY: THE ROLES OF EARLY MALADAPTIVE SCHEMAS

Elif Ünal, Middle East Technical University, Ankara - Turkey
Tülin Gençöz, Middle East Technical University, Ankara - Turkey

The current study aimed to determine the path between childhood maltreatment and schema domains (i.e., Impaired Limits/Exaggerated Standards (ILES), Disconnection/Rejection (DR), Impaired Autonomy/Other Directedness (IAOD)), which is followed with the psychopathological symptomatology (i.e., Depressive Symptomatology, and Anxiety Symptomatology) after controlling for other possible stressors in everyday life. For these purposes, after necessary approval was taken data was collected from 414 participants between the ages of 18 and 32, through Childhood Trauma Questionnaire - Short Form, Young Schema Questionnaire-Short Form 3, Beck Depression Inventory, Beck Anxiety Inventory, and Life Events Inventory (LEI). To test this path, two sets of hierarchical regression analyses were conducted. Specifically, results revealed that significant associations of Emotional Abuse, and Sexual Abuse with ILES schema domain; Emotional Neglect, Physical Abuse,and Sexual Abuse with DR schema domain; and Physical Abuse, and Sexual Abuse with IAOD schema domains were exist. Moreover, Schema domainsof DR and IAOD were found tobe positively associated with depression symptomatology, whereas only IAOD schema domain was found to be positively associated with anxiety symptomatology. Lastly, Emotional Neglect, and Sexual Abuse were associated with Depression. These results underlined the crucial role of early maladaptive schemas on the relationship between childhood maltreatment and psychopathology.

PSYCHOSOCIAL EFFECTS OF PERCEIVED EMOTIONAL SYNCHRONY IN COLLECTIVE GATHERINGS

C05. Culture and society - Group processes and intergroup relations

Dario Páez, University of the Basque Country, Donostia-San Sebastian - Spain
Bernard Rimé, University of Louvain, Louvain - Belgium
Nekane Basabe, University of the Basque Country, Donostia-San Sebastian - Spain
Anna Wlodarzyck, University of the Basque Country, Donostia-San Sebastian - Spain
Larraitz Zumeta, University of the Basque Country, Donostia-San Sebastian - Spain

This communication reports four studies, two correlational, one semi-longitudinal and one experimental, assessing the positive effects of participation in either positively (folkloric marches) or negatively (protest demonstrations) valenced collective gatherings. Results confirmed that collective gatherings consistently strengthened collective identity, identity fusion with the group and social integration, enhanced personal and collective self-esteem and efficacy, positive affect, as well as positive social beliefs among participants. In line with a central tenet of the theory, emotional communion or perceived emotional synchrony with others mediated these effects. Higher perceived emotional synchrony was associated with stronger emotional reactions, stronger social support and higher endorsement of social beliefs and values. Participation in symbolic collective gatherings also reinforced identity fusion particularly when perceived emotional synchrony was high. The respective contribution of perceived emotional synchrony and flow, or optimal experience, was also assessed. Whereas perceived emotional synchrony emerged as strongly related to the various social outcomes, flow was observed to be related first and foremost to positive affect and thus to encompass mainly positive individual affective effects.
O1319
PREVALENCE OF PSYCHOSOCIAL FACTORS OF CREATIVITY OR INNOVATION IN SOCIAL WORK AND EDUCATIONAL ORGANIZATIONS: A STUDY IN THREE NATIONS

D04. Work and organization - Well-being at work

Silvia da Costa, University of the Basque Country, Donostia-San Sebastian - Spain
Dario Páez, University of the Basque Country, Donostia-San Sebastian – Spain
Flor Sanchez, Autónoma University of Madrid, Madrid – Spain
GCH GCH, University of Talca, Autonomous University of Chile, Catholic University of Valparaiso, Talca, Valparaiso – Chile
GROU GROU, Cipsoico-Republic University of Uruguay, Catholic University of Uruguay, Montevideo – Uruguay

This study analyzes processes related to psychosocial well-being in the workplace in a sample of workers in social education in Spain, Chile and Uruguay (N=900). Participants responded scales on stress at work, control and autonomy, supervisor quality of leadership and peers social support, on organizational culture, emotional labor and their relation to well-being and organizational creativity or innovation. Answer on perceived good practices, bad practices and propositions on organizational improvement were coded by two independent experts judges on originality and efficacy, as indexes of innovation. Also participants answer a Torrance’s style cognitive creativity task. Factor analysis, multiple regression and mediational analysis were performed. Perception of transformational culture, low stress, high autonomy, quality leadership and high social support were associated, and were related to psychological well-being and positive affect. Transactional culture, negative emotional labor, high stress, and low social support were associated, and predict negative affect and low wellbeing. Transformational culture, role autonomy and wellbeing reinforce effective creative suggestions for improvement. The indirect effect was significant only for autonomy, suggesting that role characteristics are more important than personal wellbeing for innovation.
O1328
DIFFERENTIATION OF SELF AND SOCIAL ANXIETY: A COMPARISON OF JEWISH AND ARAB COLLEGE STUDENTS

C06. Culture and society - Attitudes and values

Ora Peleg, Emek Yezreel College, Emek Yezreel – Israel

This study examined the relationship between differentiation of self and social anxiety, comparing young Jewish and Arab adults in Israel and looking at gender differences. The sample consisted of 300 college students: 127 Jews and 173 Arabs (107 Muslims, 43 Christians and 23 Druze). Of these, 175 were males and 123 females, while 2 did not specify their gender. Results indicated that Jews reported higher levels of I-position and lower levels of emotional cutoff than Arabs. Females reported higher levels of emotional reactivity and fusion with others than males. On the whole, results lend support to the universality of Family Systems Theory and point to the importance of examining differentiation of self when trying to decrease social anxiety.
O1335
THE EFFECTS OF LISTENING FOR UNDERSTANDING ON ATTITUDE CHANGE

C06. Culture and society - Attitudes and values

Guy Itzchakov, The Hebrew University of Jerusalem, Jerusalem - Israel
Avraham N. Kluger, The Hebrew University of Jerusalem, Jerusalem - Israel

Individuals often try to make their counterpart consider alternative viewpoints by offering counter arguments. However, such attempts often backfire and create extreme one-sided attitudes, a phenomenon known as the “boomerang effect”. We propose that an effective alternative to offering counter arguments is listening. Drawing on Rogers's theory (1980) we hypothesize that listening, with the mere intent to understand, can change attitude by making it more complex and less extreme. We hypothesize this effect because, according to Rogers, listening for understanding reduces speaker’s anxiety and enables awareness to inner contradictions without canceling one another. Therefore, we suggest that if indeed listening makes people aware of inner contradictions, it will increase attitude complexity and consequently decrease attitude extremity. Two scenario experiments, a correlational study and a quasi-experiment (N's = 217, 196, 162, 31, respectively) supported our hypotheses. Thus, the results point to a counter-intuitive strategy for attitude change and conflict resolution.
O1340

PSYCHOMETRICS AND VISUAL IMPAIRMENT: A NEW HAPTIC TEST BATTERY USING 2D RAISED MATERIALS

A03. General issues and basic processes - Psychometrics

Anaïs Mazella, University of Toulouse 3, Toulouse - France
Jean-Michel Albaret, University of Toulouse 3, Toulouse - France
Delphine Picard, Aix Marseille University, Aix-en-Provence - France

To fill an important gap in the psychometric assessment of children, adolescents, and young adults with impaired vision, we designed a new battery of haptic tests for visually impaired and sighted individuals aged 5 to 25 years. Unlike previous existing batteries, our battery of tests included only 2D raised materials that participants explored using active touch. It was composed of 11 haptic tests, measuring scanning skills, haptic discrimination, spatial understanding, short-term memory, and picture comprehension. We administered the battery to 142 participants, half of whom were sighted (n = 71), and half visually impaired (legally blind, n = 13; low vision, n = 58). Results indicated significant (α = .05) age effects on scores, with sparse age by vision interaction effects. The reliability of test items was satisfactory (Cronbach’s alphas between .53 and .84). Convergent validity was good, as shown by a significant correlation (age partialled out) between total haptic scores and scores obtained at the B101 test (rp = .51, n = 47). Divergent validity was also satisfactory, as attested by significant but lower partial correlations between total haptic scores and raw scores on verbal tests of the WISC (similitude: rp = .40; vocabulary: rp = .38; comprehension: rp = .36; n = 62). Finally, the test-retest reliability was good (rs = .93, n = 12, one-month delay). This new psychometric tool should be useful to practitioners working with individuals with impaired vision.

The effectiveness of anger control group training with Michael Frey approach on increase rational behavior of male prisoners in Shahrekord central jail. The purpose of this study was to evaluate the effectiveness of teaching control anger Michael Frey ways to increase rational behavior in male patients of Shahrkord Central Penitentiary. Method of research was pre-test post test experimental design with a control group. The population consisted of all male patients in Shahrekord Central Penitentiary was 93-92. Using a multistage cluster sampling method to select 24 prisoners, and rational behavior questionnaire they were taken. And then were randomly assigned to experimental and control groups. 12 training session 1.5-hour each, were held for experimental group exposed to anger control by Michael Frey. Post test and one month follow up were run for two groups. Data were analyzed using analysis of variance with repeated measures. The results showed that the aggressiveness in the two groups in the pretest, posttest, and follow-up, was a significant difference. The results of this study it can be concluded anger management training is effective on increase rational behavior in male patients. Keywords: rational behavior, Michael Frey approach, group training

RELIGIOSITY COPING WITH STRESS

E03. Health and clinical intervention - Personality assessment

Khalaf Nassar Al-Heeti, United Arab Emirates University, Al Ain - United Arab Emirates
Fadwa Al Mugharibi, F., United Arab Emirates University, Al Ain - United Arab Emirates
Abuhasna Abuhasna, I., United Arab Emirates University, Al Ain - United Arab Emirates

Objectives: The objectives of this study was to: constructed Coping with Stress Scale, to adapted Religious Coping Scale to the United Arab culture, to investigated if the Coping with Stress Scale and the adapted Religious Coping with Stress Scale share a common construct and finally to test their contributions and the additional attribute variables to the general psychological health and to compare religiosity with other stress coping strategies. Method: Three scales were utilized, the adapted Brief Arab Religious Coping Scale (BARCS), the constructed Coping with Stress Scale. The data was collected from a sample from United Arab University students. Results: Factor analysis had been conducted on BARCS and coping with stress scale. The analysis revealed that BARCS has two factors. Our results show that religiosity is an independent from other coping strategy it has two factors: Internal: Belief focused on hope and rely on God; and External: Social support focused factor that rely on others religious people and religious activities.
O1357
THE INFLUENCE OF SCHOOLING ON THE RESILIENT BEHAVIOUR AND ACADEMIC PERFORMANCE OF POVERTY-STRICKEN ADOLESCENTS

F18. EXPO 2015 Hot Topics - Psychosocial consequences of disasters and poverty

G. Bester, University of South Africa, Pretoria - South Africa

The aim of the paper is to investigate the influence of additional educational support on the resilience and subsequent academic performance of poverty-stricken adolescents in Grades 9 and 10. Resilient behaviour can broadly be defined as the capacity for successful adaptation despite challenging or threatening circumstances. One such threatening aspect within the South African context is poverty. Many learners perform poorly because of their disadvantaged circumstances. The question arises whether additional educational support to poverty-stricken learners can overturn such a situation. During the presentation an overview will firstly be given regarding the concept “resilience” and factors relating to resilient behaviour. Secondly an empirical study will be discussed for which two schools were selected. The one school was a privately owned school for poverty-stricken children which offered additional support. The other school offered normal support as in any other government school. The schools were compared with regard to resilient behaviour, academic achievement, as well as other factors which relate to academic achievement such as cognitive development, study methods, teacher-learner relationships and parental involvement. Educational implications derived from the results will be discussed at the end of the presentation.
O1358
NEUROFEEDBACK – METHOD THAT LINKS TECHNOLOGY AND PSYCHOLOGY

E16. Health and clinical intervention - Other

Ana Vodanović Kosić, Croatian Association for Biofeedback and Applied Psychophysiology, University of Zagreb, Zagreb - Croatia
Ivana Lučev, Croatian Association for Biofeedback and Applied Psychophysiology, University of Zagreb, Zagreb - Croatia
Josipa Bosak, Croatian Association for Biofeedback and Applied Psychophysiology, University of Zagreb, Zagreb - Croatia

Our goal is to present theoretical and empirical basis for using neurofeedback (NFB) method in treatment of some conditions (ADHD, sleep disorders, depression). NFB is a method of self-regulation based on operant conditioning of the EEG frequencies. Using advanced technology (sensors, computer) it is possible to provide moment-to-moment information from the brain. With that kind of real-time feedback, an individual can learn how to control and change their brain activity. Emerged more than 40 years ago, when Barry Sterman proved that it is possible to train specific brain activity in cats, this method has grown into a widely accepted optional treatment for many conditions such as epilepsy, ADHD, autism, sleep disorders, PTSD, anxiety etc. We are going to explain development and theoretical basis of NFB method and present some of key studies that proved efficacy of NFB in treating depression, ADHD, anxiety, and sleep disorders. Furthermore, we are going to describe how we started using NFB 10 years ago in Croatia, what we have achieved in that time by implementing this method as an optional treatment for ADHD, depression and sleep disorders: (1) through implementing NFB in clinical practice (results presented in form of case studies); (2) through informing professional community and organizing education, supervision and workshops; In addition, we are going to demonstrate the method as a part of our presentation (using equipment for psychophysiology monitoring and neurofeedback).

PSYCHODRAMA AS METHOD FOR PROMOTING INTERPERSONAL RELATIONSHIPS AND REDUCING LONELINESS

E01. Health and clinical intervention - Assessing and accrediting quality of psychotherapy training and practice

Orit Barel Naharin, The Max Stern Yezreel Valley College, Emek Yezreel - Israel

Psychodrama, founded by J.L. Moreno in 1920, has developed as a group psychotherapy method and a therapeutic tool, but has hardly been researched. The aim of this study was to examine the benefits of the psychodramatic techniques (tele, catharsis, as-if, acting-out, sharing, processing, and role-reversal) in Education. The present research framework was rooted in three theoretical areas: 1) the psychodrama philosophy of Moreno, 2) group work theories and the eleven factors of Yalom (1985), and 3) humanistic existentialistic approaches in Education. Research questions investigated the effectiveness of psychodrama in promoting inter-and intra-personal relationship skills as witnessed through increased Intimacy, Empathy and Self-Disclosure and in reduced Loneliness; the possibility of creating an educational psychodrama program to promote communication skills among student teachers; and the short-term and long-term effects erase of the psychodramatic intervention on selected participants. The 14-lesson, 90-minutes each course, took place during one academic year. The sample population consisted of 106 female student teachers who participated in six classes of psychodrama in institutions of higher education in the north of Israel. The study incorporated both quantitative (n = 106, using pre-and post questionnaires) and qualitative (n = 25, using Spectograms, mutual interviews, case studies and final assignment) approaches. Detailed data analysis was carried out on the written responses of five of these students who were interviewed as a follow-up two years later. Psychodramatic techniques were found to promote relationship skills, although the quantitative study did not show this clearly. Loneliness was the only component that significantly decreased using both quantitative and qualitative approaches. The research provides an example of a psychodramatic educational program that can contribute to students’ inter- and intra-personal relationships. Results of the present study can be applied to classroom teaching, teacher training and educational policy. A reduction in Loneliness would lead to an increased feeling of belonging and well-being, thus reducing some sources of conflict and frustration. Psychodrama is an invitation to a meeting, a meeting of two: Eye to eye, face to face. (Moreno, 1914)
O1371
PRACTISING MINDFULNESS: CREATING AN ETHOS OF FULL PRESENCE FOR PSYCHOTHERAPISTS

Marleen De Villiers, Independent researcher, Cape Town - South Africa

The purpose of the presentation is to demonstrate how practices of mindfulness have potential to create an ethos of full presence for psychotherapists engaged in therapy sessions. The practices explored by this psychotherapist are daily meditation, mandala drawings and journal writing. The presentation draws from a theoretical background of Neuroscience, Jungian analytical psychology, Transpersonal research and psychology, Consciousness studies and Arts-based therapeutic and research methods. The importance of bringing mindfulness as consciousness into the realm of psychotherapy is highlighted, thus placing focus on the significance of full presence as a therapeutic skill. The presentation also aims to enhance the relevance of self-mastery, continuous and conscious development of the intrapersonal and individuation-process of the psychotherapist by consciously practicing mindfulness. In addition, the presentation suggests that the training of psychotherapists may benefit from the consciousness of mindfulness by using relevant skills, tools and methods. An outline of a mindfulness-training program is offered as an addendum to the presentation. Mindfulness and consciousness, full presence as psychotherapist’s ethos, meditation, mandala work, journal writing, and implications for future research and for training of psychotherapists are areas explored. This presentation can be regarded as an example of an auto- ethnographic narrative in the realm of Qualitative Research Methods.

RELATIONS OF SHYNESS AND UNSOCIABILITY WITH ADJUSTMENT IN MIDDLE CHILDHOOD AND EARLY ADOLESCENCE IN CHINESE CHILDREN

B09. Development and education - Adolescent adjustment

Junsheng Liu, Shanghai Normal University, Shanghai – China
Dan Li, Shanghai Normal University, Shanghai - China
Ying Zhou, China Executive Leadership Academy, Shanghai - China

This study examined how shyness-sensitivity and unsociability were associated with social, school, and psychological adjustment in Chinese children and adolescents. Participants were third- and fourth-grade elementary school students (n=564, M age=9 years) and seventh- and eighth-grade junior high school students (n=462, M age=13 years) in suburban schools in P. R. China. Data on shyness-sensitivity, unsociability, and adjustment were obtained from multiple sources including peer assessments, sociometric nominations, teacher ratings, self-reports, and school records. The results showed that the patterns of the relations differed in middle childhood and early adolescence. Whereas shyness tended to be associated with more social and psychological problems in adolescence, unsociability was associated with adjustment problems in various domains more consistently and strongly across domains in childhood. The results indicate that the functional meanings of social behaviors may vary across developmental periods.

PROMOTION OF QUALITY OF LIFE AMONG PEOPLE WITH DISABILITIES IN THE LABOUR MARKET

F01. EXPO 2015 Hot Topics - Capacities building and human development

Antonio Ribeiro-Tupinamba, Federal University of Ceará Brazil, Fortaleza – Brazil
Adauto Montenegro, Federal University of Ceará Brazil, Fortaleza – Brazil
Elisangela Oliveira, Federal University of Ceará Brazil, Fortaleza – Brazil

This article presents the RINEPE Program (International Network for Studies and Research on Leadership and Entrepreneurship) highlighting one of its tasks for extension and research: Project IMBA (Integration of People with Disabilities in the Labour Market), which deals with the adaptation and quality of life of workers with disabilities in the workplace and proposes actions to improve the quality of life in organizations. Among the planned research actions were undertaken translation and adaptation of research instruments (questionnaires and interview scripts) psychometric criteria required in the study area, diagnostic research using questionnaires designed based on the original design in two commercial and an educational companies to investigate the adaptation of people with disabilities (PwD) and propose improvements in the work environment. The instruments were suitable for the collection of information and data processing. Through the instruments IMBA appointed twelve employees were interviewed, ten chiefs and a representative sector of Human Research Management of both companies: a food industry and a company in the field of tourism and leisure, totaling twenty-four interviewed. Besides a group of four PwD working members of an educational institution that were also interviewed about their adaptation to the working place and their feeling and perception concerning Quality of Life at Work (QLW). The results indicate the need for physical-structural adaptations and the development of management strategies sensitive to working with people with disabilities (PwD) to resolve issues within the relationship between employees and other stakeholders in the workplace that has to do with prejudice and high competitive behavior. Strengths identified among the respondents were the quest for professional development and belief in the own potential. In the group of workers of the Educational Institution it was registered the feeling and perception of low level of QLW but also partial compatibility between the actual professional capacity of the PwD and work demands and prescriptions. Key-words: Quality of Life at Work; Disability, Adaptability, Human Resources.
Human was created from both the natural and spiritual dimensions and has multimodal functions (e.g., cognitive, behavioural, affective, sensation, interpersonal relationship, and etc.). Having One-dimensional impression in life would provide anxiety predisposition for man, but then having an integrated and monotheistic view would result in an assimilated psychological discipline for him/her. The objective of this article was to investigating how activating spiritual dimension by applying monotheism as the most important human healing mechanism could control anxiety. If anxiety is defined as "The apprehensive anticipation of future danger or misfortune accompanied by a feeling of worry, distress, and/or somatic symptoms of tension" (DSM-5, 2013, p.818), which its core characteristics are feeling threatened, fearfulness, uncertainty, disturbance, distress, and worry. Each theoretical framework of psychotherapy would attempt to provide an evident response to alleviate this anxious heart. Though prominent success in psychotherapy, research findings report symptoms relapse. The spirituality modal as an original humanistic dimension due to eliciting special aspects in clients could alleviate anxiety symptoms. This dimension would, then, sustain the treatment goal by vigilantistic man nature as a result of activating two mechanisms (i.e. integration and transcending). These contextual components based on religious texts analysis include sense of unity with God, confidence and relaxation with remembering God, modifying the image of God and reinforcement of God-concept, increasing consciousness to nurturing of God, and understanding of God as unique love object because of having full criteria for being as an entire and irreversible waning love object, having relationship to presence and the world due to regulating the interest, identity acquisition according to connecting between self-conscious, and God-conscious (that would result into being conscious about humanistic features such as kindness, generosity, and etc.), perceiving being-in-world as a transitional stage for encountering with love object and joining him in otherworld (So, How to being survival in hereafter would determine how and why we live here in this world). These concepts by applying spiritual techniques (e.g., worthiness, being goal and proposing oriented, and giving meaning) could improve ascendancy due to applying transcending mechanism (from materialism, egoism, and status), and could eliminate the insecurity, and anxiety, and then the alternative would be alacrity and joyfulness feelings and happiness. Moreover, clinical observations clarified that creating satisfaction in man would provide sincerity, monotheism and integration, and would fading the relapse predisposition. Experiencing integration and transcending is not fundamentally equivalent to equanimity which is critical component of equilibrium. But satisfaction could help to maintain treatment outcomes and could improve transcending from health into fully function person and to be commitment and acceptance. A variety of clinical experiences in the context of activating psycho-spiritual dimension revealed this practice could significantly reduce anxiety and worry.

THE MODERATING ROLE OF EMOTIONAL INTELLIGENCE IN THE RELATIONSHIP BETWEEN CORE SELF-EVALUATIONS AND CAREER SUCCESS

D05. Work and organization - Organizational behaviour

Moluk Khademi Ashkzari, Alzahra University, Tehran - Iran
Saleheh Piryaei, Alzahra University, Tehran - Iran
Ezzat Khademi Ashkezari, Alzahra University, Tehran - Iran

The purpose of this study was to develop a better understanding of how certain personality traits and emotional intelligence abilities interact with one another, and influence the extrinsic and intrinsic career success. Core Self-Evaluation Scale (CSES), Workplace Emotional Intelligence Profile-Short Version (WEIP-S) and career success subscale in occupational success scale (Gerbner et. al, 2008) were administered to 350 (250 men & 100 female) full-time employees working in an industrial company in Iran that were selected by stratified random sampling method. The data were analyzed applying hierarchical regression analysis. Results indicated that CSE was positively related to career success and emotional intelligence can moderate this association. The relationship between core self-evaluation and extrinsic and intrinsic career success may hold broad implications. Also, the moderator role of emotional intelligence in this relationship may provide opportunities for business schools to incorporate emotional intelligence training and development within their curricula to improve their employee's future career success. Keywords: emotional intelligence, core self-evaluation, career success
O1384
THE MODERATING ROLE OF METACOGNITION IN RELATIONSHIP OF PERCEIVED JOB STRESS AND NEGATIVE AFFECT

D05. Work and organization - Organizational behaviour

Moluk KhademiAshkzari, Alzahra University, Tehran – Iran
Saleheh Piryaei, Alzahra University, Tehran – Iran
Ezzat Khademi Ashkezari, Alzahra University, Tehran – Iran

The present study explored the relationships between metacognition, perceived stress and negative emotion. A sample consisted of 150 high school teacher completed the following questionnaires: metacognitions questionnaire 30 (MCQ-30), perceived stress scale (PSS), and negative affect (PANAS). The data were analyzed applying hierarchical regression analysis. Metacognition was found to be significantly related with both perceived stress and negative emotion. hierarchical regression analysis showed that metacognition moderates the relationship between perceived stress and negative emotion. The results supported this hypothesis. These preliminary results would seem to suggest that individual differences in metacognition are relevant to understanding the link between perceived stress and negative emotion. Keywords: metacognition, perceived stress, negative emotion.
Given that Internet addiction (IA) is a public health threat in Chinese societies, the present study aims to investigate the direct and interacting effects of perceived family support and presence of family members with IA among Chinese adolescents. It was hypothesized that perceived family support was a protective factor whereas presence of family members with IA was a risk factor of adolescent IA. Moreover, a buffering effect of family support on the relationship between having family members with IA and adolescent IA was also hypothesized. A representative sample of Chinese junior high school students (N=9,618), who voluntarily filled out an anonymous questionnaire, was recruited. About one-sixth of them were classified as being addicted to the Internet, according to their scores of the Chen Internet Addiction Scale. Multivariate logistic regression results showed that those reporting low family support and any family members with IA were more likely to be classified as addicted cases (p<.05). However, instead of the hypothesized buffering effect, a risk-enhancement effect (i.e., the adverse impact of family members with IA increased with family support) was observed (p<.05). The present findings provide support to family-based interventions for Chinese adolescents’ IA, but highlights that familial protective factors and risk factors may not totally operate in an independent way and therefore caution about their potential risk-enhancement interaction is warranted.
O1394
THE ROLE OF GOAL ORIENTATION IN RELATION BETWEEN THE
BASIC DIMENSIONS OF PERSONALITY AND AUTONOMOUS
FUNCTIONING

A11. General issues and basic processes - Motivation and emotion
Hossein Kareshki, Ferdowsi University of Mashhad, Mashhad - Iran

One of the most important areas of concern for psychologists, psychiatrists and specialists of Education is assessing role of personality in various functions. Explain the relationship between these two variables is always noticeable. This study aimed to investigate the relationship between personalities and autonomous by mediated role of goal orientation. The study population consisted of Mashhad University of Medical. A sample size of 335 patients was selected from the above population. Participants were 222 females and 102 males. To collect data, 15 Big Five personality questionnaire (BFI-S) Frieder et al (2011), goal orientation questionnaire with emphasis on religious orientation Kareshki (1392) and autonomous functioning scale (IAF) Winston and colleagues (2012) were used. Data analysis was performed using Pearson correlation and structural equation model. The results showed that components of Big Five personality with four goals and three autonomous functioning have significant relation, statistically ($p < 0.05$). SEM results indicated that the proposed model for the role of goal orientation in relation to the basic dimensions of personality and autonomous functions are fitted to the data from student ($\chi^2=210/31$, df=47, RMSEA=0/10, CFI = 0/83, NFI = 0/79, GFI = 0/90). According to fitting the proposed model, Required training - focuses on research designed to evaluate the effectiveness and outcomes of various domains used by researchers and experts in psychology, psychiatry and education should be.

EXAMING THE STRUCTURE OF TIME PERSPECTIVE IN POLAND

A17. General issues and basic processes - Research methods and psychometrics

Aneta Przepiorka, The John Paul II Catholic University of Lublin, Lublin – Poland
Malgorzata Sobol-Kwapinska, The John Paul II Catholic University of Lublin, Lublin – Poland

Time perspective concerns with our attitudes and thoughts towards time. The present study has two aims. Firstly, it explores the psychometric parameters of the Zimbardo Time Perspective Inventory on a Polish sample. Secondly, it examines the relations between our attitude towards time hope, proactive behavior, and active present time perspective. The participants were asked to describe themselves using a 5-point scale whether the given statements are uncharacteristic or characteristic for them. The scale consists of 56 items. Exploratory factor analyses were performed separately for three age groups: 18-25, 26-39 and 40-65 years. A sample of over 1800 participants took part in the study. In the youngest group the original structure of the scale has been supported, however in the oldest group there was a three-factor structure. The factor analysis showed a different structure of time perspective for each age group. Confirmatory factor analysis performed on a group over 1000 participants supported a five-factor structure of the scale. Our study examined criterion validity of the scale. The Polish adaptation of ZTPI provides a reliable and valid instrument for measuring time perspective.
Facebook is the most popular social networking site with over one billion users worldwide. The objective of the present study was twofold. Firstly, it was to determine cultural and psychological influences on Facebook use. More specifically, this research investigates how psychological variables such as personality and a cultural variable (independent/interdependent self-construal) relate to Facebook use in 4 cultures with different histories and values (Poland, Italy, Greece, and USA). Secondly, the relation between Facebook use and life satisfaction is examined. Over 1,000 young adults from 4 countries were surveyed. Our preliminary research showed a relationship between personality dimensions and Facebook use. Facebook intrusion was negatively correlated with openness in all cultures except Italy and with emotional stability in all cultures but Greece. Facebook intrusion was negatively related to agreeableness in only Italy and Poland and was negatively correlated with conscientiousness in all cultures but the USA. The level of Facebook intrusion was higher in the USA than in Poland and Greece, and only in the USA was it negatively correlated with life satisfaction. In addition, greater Facebook intrusion was associated with higher levels of group loyalty and lower levels of contextualized self in Italy and Poland. In the USA, it was associated with greater relational interdependence. Theoretical and practical implications of the findings will be further discussed. Keywords: Facebook; personality; self-esteem; life satisfaction; independent and interdependent self-construal; cross-cultural study
DENIAL DEFLATION EFFECT: THE INTENTIONAL REJECTION OF AUTOBIOGRAPHICAL MEMORIES LEADS TO FORGETTING

A09. General issues and basic processes - Learning and memory

Veronika Nourkova, Lomonosov Moscow State University, Moscow - Russian Federation
Anna Ivanova, Lomonosov Moscow State University, Moscow - Russian Federation
Alexandr Kozhevnikov, Lomonosov Moscow State University, Moscow - Russian Federation

Liars mostly realize that the false events they are talking about did not occur (Polage, 2004, 2012). What happens when people intentionally deny the reality of true episodes? Fifty young adults who spent two consecutive summers at a particular summer camp served as participants. Each was asked to choose three events that s/he believed had happened the previous summer and three events s/he believed did not happen. Participants then attempted to describe the 4 chosen events in a way that would convince another person that the event happened or that it did not happen. Two events served as a control. A week later, participants rated how confident they were that each Session-1 event actually occurred. Performance in general was at ceiling. There were no incorrect rejections of retold-as-if-true true events. Only one of the retold-as-if-true false events was incorrectly recognized. So we replicated the “fabrication deflation” effect. The main finding consists of the fact that significant minority of participants (17%) indicated the retold-as-if-false true events as false. We coined it as “denial deflation”. Our findings indicate that the act of lying appeared to make specific effect on memory performance for intentional creation of false story and for intentional denial of true experience. The results are discussed with respect to Conway’s model of adaptive correspondence and self-coherence as two dialectical modes of autobiographical memory functioning.

CHANGES IN AFTER SCHOOL TIME USE IN CYPRUS: PLAY AND EDUCATION

B03. Development and education - Learning and instruction

Monica Shiakou, European University Cyprus, Nicosia - Cyprus

This research was designed to investigate the changes in after school time use in Cyprus within the last 50 years with particular interest to the time spent playing and studying. Time diaries, where collected from 401 adults and children between the ages of 6 and 58, that used to be, or were at the time of data collection students in primary schools in Cyprus. The research findings indicated that children nowadays spent overall more time studying, watching T.V and using the computer than playing after school, while play declined more than 50 % in a period of less than 15 years. Even though there was a decline in time spent studying now than in the past, time invested in such academic/cognitive activities is reported to be high at all points in time under study. Children in the past were more involved in house chores and spend more time in music and art activities than today. Results are discussed in terms of a change in values as well as the economic crisis.

Keywords: Children, play, time trends, afterschool

THE PREVALENCE OF PHYSICAL INACTIVITY AMONGST UNIVERSITY OF LIMPOPO UNDERGRADUATE STUDENTS AND ITS ASSOCIATION WITH SOCIODEMOGRAPHIC VARIABLES

E11. Health and clinical intervention - Lifestyles and healthy self-regulation

PShai Elliot Nkoana, University of Limpopo, Polokwane - South Africa

Physical inactivity has been determined as the second most modifiable risk factor for poor health after tobacco smoking. Recent studies have indicated that physical inactivity is directly related to different non-communicable diseases such as diabetes, hypertension, and cancer (Haskell et al., 2007; WHO, 2009). Few studies exist investigating physical activity among university students in South Africa. A cross-sectional survey design was conducted with undergraduate students at the University of Limpopo (Turfloop Campus). An anonymous self-administered questionnaire was used to collect data. The sample consisted of 849 undergraduate students with 14% being male and 53.8% being female. The age ranged from 17 to 43 years of age and 94.7% being black. Among the participants, 3.5% were married and 90.9% single. The results indicate 32% of students engaged in low physical activity, 44.6% in moderate and 19.4% in high physical activity. The high prevalence of physical inactivity among undergraduate university students found in this study calls for strategic intervention by the relevant professionals in the Department of Higher Education in South Africa.

RETROSPECTIVE RECALL OF SCHOOL BULLYING BY PROSPECTIVE TEACHERS AND THEIR CURRENT BELIEFS ABOUT SCHOOL VIOLENCE

B08. Development and education - Bullying and aggression

Aleksandra Tłuściak-Deliowska, The Maria Grzegorzewska Academy of Special Education, Warsaw - Poland

Quite new perspective on managing school bullying is to explore pre-service teachers’ knowledge, experiences and attitudes toward school-based violence. The recent researches suggest that prospective teachers will hold a key position in reducing the problem of bullying in schools. The purpose of the study was to investigate: (1) prospective teachers’ personal experienced of school bullying, (2) current beliefs about school bullying and (3) relationship between self-reported bullying in school days and current attitudes toward bullying. The specially designed instruments were used to collect data: (1) The Retrospective School Bullying Questionnaire, which measured bullying victimization, perpetration and bystander experiences during primary, middle and secondary school and (2) The Bullying Beliefs Questionnaire. The questionnaires were distributed within the academic year 2014-2015 prior the students attending faculty of education at the Maria Grzegorzewska Academy of Special Education in Warsaw (Poland). The study provides a unique account of how adults view their school experiences and what they think now about school bullying. Findings indicate that prospective teachers’ experience have an impact on their current attitudes toward preventing and managing school bullying. Didactical conclusions of these results will be commented and implications for teachers training will be discussed.

A QUALITATIVE STUDY: SOCIAL REPRESENTATIONS TOWARD SYRIAN REFUGEES IN TURKEY

C08. Culture and society - Prejudice and social exclusion

Fatih Ozdemir, Middle East Technical University, Ankara - Turkey
Bengi Öner-Özkan, Middle East Technical University, Ankara - Turkey

Since the beginning of Syria crisis in 2011, more than 1.600.000 Syrians have been accepted by Turkish government as refugee. However, because of conflict between Syrian refugees and local residents of Turkey, prejudice and social exclusion toward Syrian refugees have increasingly continued. Social representations may indicate underlying reasons for integration problem of Syrian refugees into Turkish society. The purpose of study is to investigate social representations of Turkish society about Syrian refugees through anonymous comments which were taken from four online social dictionaries of Turkey. Seven major thematic categories were derived from ninety eight comments as (1) perceived negative characteristics of Syrian refugees, (2) perceived political characteristics of Syrian refugees, (3) perceived negative effects of Syrian refugees on socio-economic structure of Turkey, (4) perceived problems in Syrian refugee policy of government, (5) supportive opinions toward Syrian refugees, (6) proposed solutions for perceived Syrian refugee problem and (7) other criticisms toward Syrian refugee topic. The present study may make a significant contribution to literature of prejudice, social exclusion, social representations and refugee studies. Also, in order to decrease social exclusion toward Syrian refugees, findings of study can be used in refugee policy of government.
O1430
“THEY SAY TIME HEALS IT... IT DOESN’T”: BEREAVEMENT EXPERIENCES OF PAKISTANI WOMEN FOLLOWING INFANT MORTALITY

C07. Culture and society - Race and ethnicity
Romana Farooq, University of Leeds, Leeds - United Kingdom
Ghazala Mir, University of Leeds, Leeds - United Kingdom
Fiona Thorne, University of Leeds, Leeds - United Kingdom

The death of an infant can be a painful and distressing experience (Boyle, 1997). Reactions to and adjustments following the loss are often connected with the social, cultural and political position of the mother (Boone, 1985). Socially disadvantaged women, particularly West African, Caribbean, Pakistani and Bangladeshi women experience the highest rate of infant mortality in the UK (ONS, 2013, 2014). Despite this, there is evidence that these women are underrepresented in decision making bodies for maternity services (Mir et al, 2013). As a result their voices are most often left unheard and their experiences overlooked. Co-constructing their narratives can be an extremely powerful experience for practitioners and an empowering process for the women themselves. This paper presents the findings from one of the first research projects to explore the “seldom heard”bereavement narratives of bereaved Pakistani women as they navigate health services. The paper explores ideas around the impact of disadvantage on women’s empowerment and “voice”, their accounts of dealing with the professional world and the multiple “stories of blame” associated with the death of an infant. The narratives document the impact of “non-existent” bereavement support, the importance of religion and the power of sharing stories in the process of healing. Women’s narratives also suggest ways in which services could better meet their needs.
Purpose: This study aimed to investigate the psycho-social mechanism of depression in the work place from a socio-cultural perspective. We propose a Four Level, 10 Dimension Model of Work Culture, which attempts to examine work culture from multiple perspectives (Kanai, et al., 2014), and compare this model across six nations, including China, Finland, Germany, Japan, South Korea, and the United States. This model consists of the four levels of Socio-Cultural, Workplace, Job, and Individual Factors. For each level, we measured the 10 dimensions of: Individualism/collectivism; Gender Egalitarianism; Organizational Systems; Leadership; Group Norms; Teamwork; Job Stressors; Autonomy; Workaholism; and Importance of Work. These factors predict the outcome variable of Depression. Method: Data was collected through a web-based questionnaire survey. We collected 600 responses from each country, controlling for age and sex. Results: The results showed Workaholism and Role Ambiguity increased depression in the workplace in each country. On the other hand, in Korea, pressure P of Leadership and Overload increased depression and Autonomy increased it in China. In Japan, demanding to change increased depression, while in the United States, the exclusion of inefficient workers and Role Conflict increased it. In Finland, feedback-based evaluation systems, planned P of Leadership, and pressure to work longer hours increased it. We discussed the results from a socio-cultural perspective.
The purpose of this study was to evaluate the effectiveness of problem-solving skills on reducing parental stresses. The research methodology was a quasi-experimental approach with a single-group pretest-posttest design. The study population included parents of students in the non-profit schools in Tehran, among which 33 subjects were selected by convenience sampling method. The research tools consisted of "Parental Stress Questionnaire" (Shokoohi-Yekta & Parand, 2088 b) and "Parenting Styles Questionnaire" (Shokoohi-Yekta & Parand, 2088). The parents participated in the workshops of "Thoughtful Child", and were trained on the use of problem-solving methods in order to change their cognitive processes in dealing with challenging behaviors of their children. The workshops were held for 10 two-hour sessions, once a week. The parents completed the questionnaires in an initial survey, before starting the workshops and at the end of the course. The Multivariate Analysis of Variance (MANOVA) method was used to analyze the research data. The results showed that problem solving skills training had a significant impact on improving parenting styles (p < 0.05, $\eta^2 = 0.55$). Thus, one can conclude that the problem-solving training can be used as a method to improve parents' methods in nurturing their children.

Keywords: Parental stresses; Parenting style; Problem solve

EFFECTIVENESS OF ANGER MANAGEMENT TRAINING ON MOTHERS' PSYCHOLOGICAL WELL-BEING COMPONENTS

F16. EXPO 2015 Hot Topics - Other

Mohsen Shokoohi-Yekta, University of Tehran, Tehran – Iran
Nayerh Zamani, University of Tehran, Tehran – Iran
Samaneh Alimohammadi Malayeri, University of Verona, Verona – Italy
Javad Purkarimi, University of Tehran, Tehran – Iran
Mohsen RafeeKhah, University of Tehran, Tehran – Iran

In this study, we examined the effect of anger management training workshops based on cognitive-behavioral approach on mothers' psychological well-being components. The research methodology was a quasi-experimental approach with a single-group pretest- posttest design. The study population consisted of all mothers living in Tehran. The sample encompassed 81 mothers who enrolled to participate in the training program voluntarily, selected by a non-probability sampling method from districts 1 to 5 in the city of Tehran. The participants were trained in four workshops, 20 participants per workshop with the same conditions and program. Anger management training workshops were held for 7 weeks, a two-hour session per week. The subjects answered to Ryff's Psychological Well-Being Scale (1989) in the two pre-test and post-test stages. Based on dependent t-test results, among psychological well-being scale components, the mean changes of purposeful life and personal growth components were statistically significant; however, comparing the pretest and posttest means of the other components, including self-acceptance, positive relations with others, autonomy and environmental mastery, changes were not significant. Finally, the discussion, conclusion and suggestions for future research are provided. Keywords: Anger control; Mental health; Parent education.
O1437

EFFECTIVENESS OF PSYCHOSOCIAL SKILLS TRAINING (PST) PACKAGE ON DRIVERS' MENTAL HEALTH

D10. Work and organization - Traffic and transportation

Mohsen Shokoohi-Yekta, University of Tehran, Tehran – Iran
Samaneh Alimohammadi Malayeri, University of Verona, Verona - Italy

Drivers' mental health is one of the most important predictors of driving behavior, and any shortcoming in this area can be followed by adverse and irreversible consequences for drivers and the passengers as well. In the present study, the effectiveness of psychosocial skills training package on drivers' mental health was studied. The training program was performed on a group of drivers (174 subjects) in nine 80-minute sessions. The research tools included Mental Health Inventory (MHI- 28) (Veit & Ware, 1983) and Depression Anxiety Stress Scale (Lovibond & Lovibond, 1995). The results indicated the effectiveness of training package on increased mental health. The application of findings, research limitations, and suggestions for future research are also discussed. Keywords: Mental well being; Drivers; Stress; Depression; Anxiety

IDEOLOGISATION AND BIAS OF ENTREPRENEURIAL VISIONS.
EMPIRICAL RESEARCH OF VALUE CONFLICTS IN ORGANIZATIONAL CULTURE

D02. Work and organization - Leadership and entrepreneurship

Peter K. Vlasov, Institute of Applied Psychology 'Humanitarian center', Kharkov – Ukraine

Problem setting: Organizations exist in process of making, interpreting, transferring the meaning. Initiator’s/owner’s original concept is repeatedly biased. Personnel create discourse/linguistic ideology which biases/favors concept implementation. That’s why we decided to analyze top-managers’ stylistic peculiarities in reinterpreting/biasing of initiator’s concept. Method: method of hierarchical self-description, discourse-analysis. Results: We discovered that sense making is represented by 3 hierarchical stylistic ways of concept biasing and reinterpreting: Procedural style, aimed at preserving status-quo and manager’s positions: personnel must observe discipline, not to violate instructions; management is reduced to instructions, subordination, formal observing of rules. Personal-authoritarian style, aimed at manager’s self-affirmation and authority. Managing is conformity with orders, manager is the main guarantor, authority and lawmaker. Personnel is obedient, loyal, “army” is prevailing construct. Caring style, aimed at affiliation and acceptance, basic rules are implicit arrangements that provide mutual understanding, manager is consultant, justice of peace, conducts negotiations with personnel. Personnel avoid conflicts, seek for solutions of conflicts and negotiate. “Arrangements” is prevailing construct. In crisis situation managers’ sense making isn’t normative, non-standard, individual, reduces morphology, biases the meaning and consequently – the initiator’s concept.

INFLUENCES OF INTELLIGENCE AND OPENNESS ON THE ACQUISITION OF INFORMATION-SEEKING SKILLS: A TWO-WAVE LONGITUDINAL STUDY

B15. Development and education - Longitudinal analysis

Tom Rosman, Leibniz Institute for Psychology Information (ZPID), University of Trier, Trier - Germany
Anne-Kathrin Mayer, Leibniz Institute for Psychology Information (ZPID), University of Trier, Trier - Germany
Günter Krampen, Leibniz Institute for Psychology Information (ZPID), University of Trier, Trier - Germany

The present work examines the role of intelligence and openness in the acquisition of scholarly information-seeking skills. Despite plenty of research on beneficial effects of intelligence and personality on academic achievement, little is known about their single and combined influences on information-seeking skills. As differentiated information-seeking involves many abilities measured by intelligence tests (e.g., analytical and problem-solving skills), and requires a certain amount of open-mindedness, we assume that intelligence and Openness for Experience predict the acquisition of scholarly information-seeking skills in psychology students. To test this hypothesis, a two-wave longitudinal study with 126 German psychology freshmen (81% females; mean age: 20.39 years [SD = 2.43]) was conducted. To assess the increase in information-seeking skills (measured by a standardized and validated test) across a 6-month-interval (beginning of first to beginning of second semester), a scaled gain score was calculated, which correlated significantly with both verbal intelligence (verbal analogy tasks; r = .24; p < .01) and Openness for Experience (NEO-FFI; r = .23; p < .01). In multiple regression, both variables had an independent effect on information-seeking (intelligence: β = .18; p < .05; openness: β = .17; p < .05). We conclude that both constructs play a major role in the acquisition of information-seeking skills, and encourage their consideration in theory and practice.

Maggie E. Toplak, York University, Toronto - Canada
Nathan Kolla, Centre for Addiction and Mental Health, Toronto - Canada
Gina Stoduto, Centre for Addiction and Mental Health, Toronto - Canada
Mark van der Maas, University of Toronto, Toronto - Canada

Background: Cohort and case-control studies have found that Conduct Disorder (CD) or conduct problems are associated with alcohol-impaired driving. However, few, if any analyses have examined this relationship using a population-level approach. Purpose: The current study sought to examine the impact of childhood (before age 15 years) symptoms of CD on driving after drinking using results of a general population survey in Ontario, Canada. Methods: Data were based on telephone interviews with 5,299 respondents who reported having driven in the past year. Data were derived from the 2011-2013 cycles of the CAMH Monitor, an ongoing cross-sectional survey of adults aged 18+ years. A binary logistic regression analysis of drink-driving in the previous 12 months was conducted, consisting of measures of demographic characteristics (sex, age, marital status, education, region), driving exposure, problem alcohol use, symptoms of attention deficit hyperactivity disorder, and childhood (before age 15 years) symptoms of CD. Results: With simultaneous entry of all variables in the regression analysis, childhood (before age 15 years) symptoms of CD significantly increased the odds of reporting driving after drinking (OR=1.67, p=.05). Discussion: Results from a general population survey in Ontario suggested that childhood symptoms of CD are associated with significantly increased odds of driving after drinking in adulthood. Implications for CD treatment and driver safety will be discussed.
We hypothesized that (a) when people share a meaningful story, as oppose to when they share information, they make their partner listen well, and (b) that narrative-induced listening is positively associated with psychological safety and negatively associated with social anxiety. We tested these hypotheses in three experiments (N’s = 45, 52, and 42). In the experiments, we manipulated both narrative, with narrative condition versus informational-discourse condition (telling about daily routine and describing buildings), and role by assigning participants to listening and speaking roles (Studies 2 & 3. Speakers rated their partners as better listeners in narratives condition than in the informational-discourse condition. Moreover, we found that the perceived narrative-induced listening mediated the manipulation effects on psychological safety, and social anxiety (Study 3). Thus, we concluded that when people share meaningful stories they make their partner listen well and consequently experience higher psychological safety and lower feelings of social anxiety.
ASSOCIATION BETWEEN COPING BEHAVIORS, DOMESTIC VIOLENCE AND DEPRESSION IN PARENTS OF CHILDREN WITH DOWN'S SYNDROME

Aim: Analyze the prevalence of domestic violence and depression and their association with coping behaviors in a group of parents of children with Down’s Syndrome. Study Design: No experimental, descriptive-correlational. Sample: This study used a non probabilistic sample of 212 parents of children with Down’s Syndrome, men and women, were the average age was 43.52 years old and most of them reported to be married (66%). The average age of the Down’s Syndrome children was 13.7 years old. Method: The instrument applied was composed by three scales: the depression symptoms were evaluated using the Center for Epidemiologic Studies Depression Scale (CES-D), an adapted version of the Coping Mechanisms Scale (EEC-M) for the measuring of coping strategies, and a domestic violence scale validated in Mexican population (Martínez Lanz, 2007). Results: The largest percentage of parents reported low levels of depression symptoms and domestic violence (79% y 87%, respectively). The results showed that parents with the highest levels of depressive symptoms usually got a more adequate solution for the problems, also reported more religious ways of coping situations, higher inhibition of their own emotions, search of professional support for aggressive reactions, cognitive avoidance and a bigger expression and distortion of problems. Conclusion: highest correlations were found in emotional inhibition, aggressive behavior and difficult coping expressions depressive symptoms were strongly related with rejection of emotional decisions and aggressive behavior. Key Words: Coping, Depression, Down Syndrome.
DESIGNING AND TESTING CAUSAL MODEL OF RELATION BETWEEN DISPOSITIONAL FLOW AND COMPETITIVE ANXIETY WITH MENTAL TOUGHNESS AND SPORT ORIENTATION

E10. Health and clinical intervention - Sport and exercise

Abbas Abolghasemi, University of Mohaghegh Ardebili, Ardabil - Iran
Azar Kiamarsi, Islamic Azad University, Ardabil – Iran
Mohammad Ali Ghaseminejad, University of Mohaghegh Ardebili, Ardabil – Iran

The roles of psychological parameters in predicting mental toughness and sport orientation are well established. The aim of the research was designing and testing causal model of relation between dispositional flow and competitive anxiety with mental toughness and sport orientation in Physical Education students. The research sample consisted of 172 students who were selected among students of Physical Education in the Ardabil Province of Iran. Participants answered Sports Mental Toughness Questionnaire (SMTQ), Dispositional Flow Scale-2 (DFS-2) and Task and Ego Orientation in Sport Questionnaire (T-EOSQ) and Competitive Anxiety Questionnaire (CAQ). Evaluation of proposed models was done using structure equation modeling (SEM) based on AMOS-22. Structure equation modeling analysis showed that proposed antecedent model is not graceful to the data and needs some corrections. Therefore, by omission of non-meaningful routes, fitting of final antecedents model with data was approved 0.06 by RMSEA. Application of Chi square test confirmed final model improvement procedure. Based on findings, dispositional flow, through Competitive anxiety, has indirect meaningful effect on mental toughness. But for dispositional flow, such indirect meaningful relation with sport orientation was not observed through competitive anxiety. This can be a useful model for mental strength and efficiency of athletes. Keywords: dispositional flow, competitive anxiety, mental toughness and sport orientation

SCHOOL BASED PRIMARY PREVENTION OF RADICALIZATION BY MEANS OF TEACHING SOCIAL AND CIVIC SKILLS

F19. EXPO 2015 Hot Topics - Life skills in culture and society

Eri Park, Utrecht University, Middelburg – Netherlands
Marcin Sklad, Utrecht University, Middelburg – Netherlands

The purpose of this paper is to share the composition and initial findings of a universal school based program aimed at primary prevention of radicalization by means of teaching social and civic skills. The program draws upon theories of Global Citizenship and empirical findings of Social Psychology. The program delivers materials designed to foster empowerment, to stimulate empathy and understanding of different perspectives and world views. These materials can be used by teachers to implement them in their lessons. It is a unique program, as it aims to tackle radicalization at its source without singling out or stigmatizing individuals at risk. The program provides secondary schools with the opportunity to teach skills, which often fall outside the regular curriculum. On a more structural level, the program counteracts the threat of social or religious radicalization in European societies by providing young people with alternatives to violence. The program aims not only to prevent processes of radicalization, but also to increase civic and social competences at the same time. Forty-eight social psychology students conducted a pilot implementation of the program in 24 Dutch secondary school classes. The evaluation of the pilot reveals positive potential of the program, but also risks and limitations that have to be taken into account.

SENSE OF COHERENCE, SELF-EFFICACY AND TASK-ORIENTATION: PREDICTORS OF SPORT PERFORMANCE IN FEMALE WUSHU ATHLETES

E10. Health and clinical intervention - Sport and exercise
Azar Kiamarsi, Islamic Azad University, Ardabil - Iran
Abbas Abolghasemi, Department of Psychology, University of Mohaghegh Ardebili, Ardebil – Iran

Although studies have revealed significant relationship between personality and sport performance, but the role of sense of coherence, self-efficacy and task-orientation upon sport performance remains unclear. The aim of the research was to determine the role of sense of coherence, self-efficacy and task-orientation in predicting sport performance in female Wushu athletes in national competitions in Iran. The research sample consisted of 175 females who were selected through available sampling method in national competitions of Alborz province in Iran. To collect the data, Sense of coherence Scale, Self-efficacy Scale, Goal- Orientation Scale and Checklist of Sport Performance were used. The research results showed that Sense of coherence, self-efficacy and task-orientation have positive correlation with sport performance. The results of multiple regression analysis showed that Sense of coherence, self-efficacy and task-orientation explained 33.9 percent of variance of sport performance. The findings have important implications about the role of psychological variables on sport performance and life quality of athletes. Keywords: Sense of coherence, self-efficacy, task orientation, sport performance, athlete
The aim of the current research is the role of attachment styles in mate selection preferences. The research population consisted of single persons in Tehran who are in the age range between “22 - 40” and have at least High School Diploma, while certain psychological problems have not been diagnosed. Two-stage cluster sampling with selection of Shahid Beheshti, Tarbiat Modarres University and within each cluster available sampling was performed. Samples available and interested in participating in the study included 114 (68 girls and 46 boys). The researcher made a program about mate choice, a computer program written in the C programming language and comprised of two parts 1) Demographic characteristics of participants 2) Test mate selection and Hazan and Shaver Attachment Inventory (1987). To describe the data, measures of central tendency and parameters of dispersion were used. For inferred statistical, “t” test was used to compare two genders in prioritization of mate selection, and the regression model to predict priority selection criteria with considering three attachment styles. Results showed that the criterion of “mutual attraction - love” and “loyalty” were raised by women and men as the first and second priorities, but on the third criterion, were considered important the independent character for women and adaptation for the men. There is a significant positive Correlation between “abiding” and avoidant attachment style. However, there were a significant negative correlation between the secure style and criteria of “abiding” and “good cook and housekeeper”.

THE RELATIONSHIP BETWEEN FACEBOOK ADDICTION DISORDER WITH PERSONALITY CHARACTERISTICS (EXTROVERSION, INTROVERSION), SELF-ESTEEM, EARLY MALADAPTIVES SCHEMA AND NARCISSISM

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Tayebeh Shahrivar, Islamic Azad University, Shiraz - Iran
Sadrollah Khosravi, Islamic Azad University, Firoozabad – Iran
Leyli Shahriyari, Islamic Azad University, Shiraz – Iran
Masoumeh Hamidi, Islamic Azad University, Yasouj – Iran
Habib Dehghani, Islamic Azad University, Shiraz - Iran

Introduction: The purpose of this study is to consider Facebook addiction disorder and relationship between some of analytic variables such as extroversion, introversion, self-esteem, narcissism and early maladaptive schemas with Facebook addiction disorder. Materials and Method: 180 person (102 males and 78 females) from the Salman Farsi University, Islamic Azad University and high school students in Kazeroon city, which has had a Facebook account, were selected with nonrandom sampling and they responded to Bergen Facebook addiction Scale (BF AS), Cooper smith self-esteem questionnaire, Eysenck personality questionnaire, Young early maladaptive schemas questionnaire and Ames narcissism questionnaire (NP116). For this study, we used person correlation and Regression Analysis. Results: the results of the statistical analysis showed direct positive effect of all variables, except self-esteem on Facebook addiction and also showed extraversion has negative relation with Facebook addiction and narcissism, introversion, and early maladaptive schemas, have a significant and positive relation with the Facebook addiction. Conclusion: The results of this study can be concluded that Facebook addiction disorder is associated with some analytical variables. Keywords: Facebook addiction disorder, narcissism, introversion, self-esteem, early maladaptive schemas.
Objective: The aim of the study was to explore adolescents’ attitudes toward stigmatized groups according to Goffman's classification (mental illness, physical handicap, immigrant) and to evaluate the effectiveness of an anti-stigma intervention using films and literature in altering self-reported attitudes. Background: Adolescents are an important group for fighting stigma toward mental illness and other stigmatized groups because their opinions will determine future attitudes. Methods. A total of 1430 adolescents completed the self-administered Standardized Stigmatization Questionnaire, version 1 (SSQ1) and questionnaire Stigmaquest. Data were collected at two time points: before the intervention and at the conclusion of anti-stigma campaign. For statistical analysis chi square test and cluster analysis were used. Conclusions: The results revealed that adolescents perceive some kind of singularity in people with mental illness. The data suggest that short-term interventions using films and literature may change self-reported attitudes. Anti-stigma programs might be an appropriate context for incorporating such interventions.

RELATIONAL AGGRESSION AS MEDIATOR OF MATERNAL PSYCHOLOGICAL CONTROL AND ADOLESCENTS’ FRIENDSHIP QUALITY: A LONGITUDINAL STUDY

Aylin Koçak, Hacettepe University, Ankara - Turkey
Athanasios Mouratidis, Hacettepe University, Ankara - Turkey
Yeliz Kindap Tepe, Cumhuriyet University, Sivas - Turkey
Melike Sayil, Hacettepe University, Ankara - Turkey

Parental controlling behaviors can help adolescents form qualified peer friendships (Steinberg, 2001). Yet, given the decreased role of parents and the negative impact of parental psychological control (PC) on adolescents’ functioning during transition to the adolescence (Mounts & Steinberg, 1995), it becomes apparent that more research is needed to investigate the processes that underlie the associations between parental psychological control and adolescents’ peer relationships. In this longitudinal study we aimed to build on prior research by examining the mediator role of relational aggression on the association between maternal PC and adolescents’ quality of friendships. The sample consisted of N = 527 adolescents (Mage = 14.3, SD = 0.32). The results of structural equation model (S-By2 $[167; \text{N} = 470] = 377.89$, p < .01, CFI = .915, SRMR = .049, RMSEA = .052 [90%CI: .045 - .059]) showed that maternal psychological control (T1) predicted adolescent’s relational aggression nine months later (T2, $\beta = .16$), which in turn predicted adolescents’ poor quality of friendship (T2, $\beta = .54$). In addition, PC directly predicted poor quality of friendships ($\beta = .15$), suggesting that relational aggression partially mediated the associations between maternal psychological control and adolescents’ negative quality of friendships. The findings are discussed in terms of the type of the control that mothers use, the adolescents’ relational style, and their social functioning.
O1484
EXPLORING PREDICTORS OF HAPPINESS IN TURKEY

C16. Culture and society – Other

Fatih Çetin, Nigde University, Faculty of Economics and Administrative Sciences, Nigde – Turkey
Faruk Sahin, Nigde University, Faculty of Economics and Administrative Sciences, Nigde - Turkey
Onur Köksal, Nigde University, Faculty of Economics and Administrative Sciences, Nigde - Turkey
Duysal Askun Celik, Istanbul Kemerburgaz University, Istanbul - Turkey

Purpose: Most of the research on happiness and its determinants have been conducted in developed countries. Less is known about happiness in developing countries. The purpose of this study was to explore the predictors of happiness in Turkey.

Design/Methodology: We examined predictors of happiness by analyzing data from the 2012 Turkish Life Satisfaction Survey - TLSS (n=7956). The TLSS is a nationally representative and cross-sectional survey conducted by Turkish Statistical Institute on an annual basis. The survey includes individual level variables such demographic information, socio-economic characteristics, happiness, satisfaction with several domains of life (e.g., satisfaction with family, health, job, income, friends and public services). In order to explore the predictors of happiness, we utilized hierarchical regression and relative weight analyses.

Results: Results indicated that satisfaction with health, family, residence, job, income, interpersonal relationship, and public services were positively related to happiness after controlling for several demographic variables. Relative weight analysis showed that satisfaction with income, family and public services were the top three predictors of happiness.

Limitations: The cross-sectional data may not be sufficient for empirical causal analysis.

Practical Implications: The findings are useful insights for decision-making in public policy and resource allocation to promote individuals’ happiness in Turkey.

Originality/Value: To our knowledge, this study is a preliminary examination of the predictors of happiness in Turkey, and expanded the potential predictors set of happiness in developing countries. Keywords: Happiness, Life Satisfaction, Turkey.

INVESTIGATION OF EFFECTIVENESS NEUROFEEDBACK AND COMPUTERIZED COGNITIVE TRAINING TO IMPROVE WORKING MEMORY IN ADULTS WITH ATTENTION DEFICIT / HYPERACTIVITY DISORDER

A06. General issues and basic processes - Cognitive neurosciences and neuroimaging

Leila Heydarinasab, Shahed University, Tehran - Iran

Introduction: Attention deficit / hyperactivity disorder, is one of the most common neuro-psychiatric disorders, which started in childhood and continues into adulthood and in various aspects of life such as personal, social, professional life, executive functioning, including working memory and concentration are created problems. Several studies regarding the treatment of this disorder has been proposed by the authors, due to lack of studies on the efficacy of neurofeedback in reducing symptoms of ADHD in adults in Iran, the current study formed. Method: The research design was a quasi-experimental pretest-posttest control group. The study population included adults with attention deficit / hyperactivity disorder that referred to Atieh clinic referred in Tehran. Among the statistical population, 8 person in 2 groups, one experimental group (Age Mean: 36.37, SD :1.03) and one control group (Age Mean:31.87, SD :8.69) of patients referred to the Atieh clinic, based on purposive sampling was selected. The research instruments were the Beck Anxiety Inventory, Beck Depression Inventory, Inventory adult attention deficit / hyperactivity disorder of Barkley, and test CNSVS. Data through SPSS software using U Mann-Whitney statistical analysis was performed. The independent t-test, Wilcoxon and Kruskal-Wallis test was also used for complementary results.

PRODUCTIVE COMMUNICATION IN SITUATION OF UNCERTAINTY.
HIERARCHICAL STRUCTURE OF INTERACTION “MAN-TEXT”

A10. General issues and basic processes - Language and communication

Anna A. Kiseleva, Institute of Applied Psychology "Humanitarian center", Kharkov - Ukraine

Problem setting: The significance of communication rises simultaneously with the increase in the level of environment uncertainty. It demands creation of special structure of communication on different hierarchical levels of complexity. Purpose: To analyze the structure of productive communication “man-text” in situation of uncertainty. Method: Method of intertextual questions. Results: In a series of independent researches we have discovered that productive communication has the following structure: formal level (subject’s personal attitude towards an object); substantive static level (aimed at participants, objects and their attribution); substantive dynamic level (aimed at dimension of action); logical-semantic level (aimed at dimensions of relations between objects, participants and actions); level of inferences (synthesis of conclusions). We have discovered the regularity of correspondence between hierarchies of communication structure and the complexity of the text. When it is violated, communication efficiency decreases. We have also discovered the phenomenon of personifying effect which characterizes the level of subjective involvement into communication process. It mediates the quality of comprehension of the complex text which is impossible without involved personified and confidential attitude. So productive communication in situation of uncertainty demands adequate level of hierarchy and personification of the content.
O1488
SOME PARADOXICAL EFFECTS OF EGO-DEPLETION ON PERSISTENCE

A11. General issues and basic processes - Motivation and emotion

Alexander Unger, University of Applied Sciences Ludwigshafen, Ludwigshafen - Germany

The effects of Ego-depletion are well documented in the literature by an enormous number of experimental studies. Some studies have however also shown that under certain circumstances the reverse effects can be observed. These approaches emphasize the role of mind-sets or effects of adaption. In our current study, we tested the influence of an ego-depletion manipulation by using different instructions on persistence in forming sentences by presented initial letters. For ego-depletion manipulation, we used a handgrip task and varied the instructions: for the non-ego-depletion we requested to squeeze the handgrip for as long as they could before it became uncomfortable. For the experimental condition, the participants were requested to squeeze for as long as possible. A manipulation check confirmed that participants in the ego-depletion condition showed longer persistence times. The results showed that the participants of the ego-depletion condition produced more sentences compared to the control condition. The critical point may be that the instructions for the first task show some kind of spill-over to the second task. In the current study, the demand characteristics, the perceived achievement level or expectations about the expected performance can be considered as an underlying mechanism. This emphasizes the possibility to ameliorate or even reverse the ego-depletion effect under certain circumstances.
O1493
THE ROLE OF LIFE QUALITY AND SOCIAL SUPPORT FOR THE FAMILY OF CHILDREN WITH LEUKEMIA

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Gokhan Malkoc, Istanbul Ticaret University, Istanbul – Turkey
Ebru Kaplanoglu, Okan University, Istanbul – Turkey

The role of life quality and social support for the family of children with leukemia. The effects of leukemia, most frequently seen cancer type in childhood, on parents have been studied widely. There are a few studies examining various factors for the parents having a cancer diagnosed child. These studies indicated that parents substantially need financial and mental support, particularly in the long lasting treatment process of leukemia. They also showed that life quality may play a critical role for the parents within the treatment process. Therefore, the studies investigating the life quality of parents and their social support level are being more and more essential. Based on this, we examined the relationships between life quality and social support level of the parents with children having diagnosed leukemia. Data were obtained from 35 families of leukemia diagnosed child and 35 families not having leukemia diagnosed child or any chronic disease. Participant of 35 families with leukemia diagnosed child was selected voluntarily from pediatric and hematology services of some hospitals in Istanbul. The rest of the participant was selected on the basis of snowball sampling procedure from parents who had a healthy child. We used Demographic Information Form, the Revised Parental Social Support Scale and Who Quality of Life Scale - Short form (WHOQOL-Bref) scales to collect the data. The results revealed that there was a positive relationship between life quality and social support. It was found that the life quality and social support level of the parents having a child with leukemia were lower than parents with a healthy child. When the differences between mothers and fathers in terms of life quality and social support level were examined, it was shown that the fathers’ social support level and the life quality were better than mothers. Demographically, life quality and social support did not vary by age whereas it changed with education meaning that the educated individuals cope with the problems in better ways than the uneducated ones. To conclude, interventions targeting to support life quality and activating social support resources of the parents were critical in health institutions.
A.L. Zhuravlev’s concept of collective subject stages (2000) is used for reconstruction of the history of the Soviet scientific society’s paradigm unity formation. The data on scientific activity of 41 leading Russian psychologists of the first half of 20th century became the material for biographical analysis. 2342 research papers were analyzed by qualitative and quantitative methods. As the result pre-subjectivity stages of forming and development collective subject were identified. Both interrelationships between members of the society and social significance of the challenges they meet were considered as the criteria for the stage formation. It was reached in pre-revolutionary Russia in 1901-1922, and in the USSR in 1923-1931. The criteria for reaching the stage of the forming collective subject in 1932-1939 are the collective subject hierarchy and objectivity of its activity. Formation of reflexivity and ability to self-organization and self-development suggest that the society reached the stage of the developed collective subject in 1940-1950. Soviet psychologists were united by the idea of mental activity as a subject of research, the necessity of objective method of research, by the principles of development, determinism, etc. The paradigm formation made it possible to achieve success in the development of applied and practical psychology during WWII, as well as ensured the maintenance of theoretical independence in the period the “Pavlovian” session.

ARE ECCENTRIC EATING HABITS A MANIFESTATION OF AN UNDERLYING EATING DISORDER?
Shulamith Kreitler, Tel-Aviv University and Sheba Medical Center, Tel-Aviv – Israel
Michal M. Kreitler, Tel-Aviv University, Tel-Aviv – Israel

Introduction: Eccentric eating habits (EEH) represent various unusual eating habits that have been widely documented. The estimates about its prevalence range from 20 to 70% depending on the defining criteria. There is disagreement about the nature of EEH, whether it represents a pathology that may develop into an ED or just fussy habits. Objectives: To examine whether tendencies for EEH are a manifestation of an underlying tendency for EDs. Aims: To test the hypothesis that a high level of EEH will be related to high scores on the Cognitive Orientation Questionnaire of Eating Disorders (COQ-EDs) which represents tendencies shared by the major EDs and assesses the underlying motivations for EDs. Methods: Participants were 340 high school students (52% girls, 48% boys), 16-18 years old, from three different schools. They were administered the questionnaire of EEH, the COQ-EDs and the EAT 26 which assesses clinically significant EDs. Results: Analyses of variance showed significant differences in the COQ-EDs scores between three groups: high scorers on EAT 26, high EEH scorers and low EEH scorers, especially between the first and the last two. A stepwise discriminant analysis provided correct identification of group membership in 77.9 % (versus 33% expected by chance). Conclusions: The findings disconfirmed the hypothesis. EEH differs from tendencies for actual EDs. In the worst case they may be a mild form of EDs. It is doubtful whether it is necessary or desirable to treat EEH.
O1509
BORDERLINE PERSONALITY TRAITS FROM THE PERSPECTIVE OF THE ALTERNATIVE DSM-5 MODEL FOR PERSONALITY DISORDERS

E02. Health and clinical intervention – Psychodiagnosis

Karel Riegel, Charles University, Prague - Czech Republic
Marek Preiss, University of New York in Prague, Prague - Czech Republic

The Diagnostic and Statistical Manual of Mental Disorders–Fifth Edition (DSM-5) features two conceptions of Borderline Personality Disorder (BPD), one based on the retained DSM-IV’s categorical diagnosis and the other based on a model that blends impairments in personality functioning with a specific trait profile intended to recapture DSM-IV BPD. Nevertheless, the broader literature contains a richer array of potential conceptualizations of borderline personality, including distinguishable perspectives from psychiatric nosology, clinical observation and psychodynamic theory. This raises questions about the most suitable pattern of traits to use to reflect various conceptions of borderline pathology via the Personality Inventory for the DSM-5 (PID-5). In this study, we examine the associations of the Borderline Personality Questionnaire, the Inventory of Personality Organization and the PID-5 dimensions and facets in a larger non-clinical sample of undergraduate students and community adults. The results we discuss are suggesting strong associations with PID-5 Negative Affectivity, Disinhibition and Antagonism scales across borderline personality measures, consistent with the DSM-5’s proposed representation of BPD. Moreover, the current investigation provides support for the psychometric properties of the Czech version of the PID-5, the new DSM-5 diagnostic instrument in non-clinical sample.
The purpose of the present study was to assess the changes in attention level between the ages of 20 and 85 years. A well-known fact is that cognitive abilities decline with age, probably due to insufficient use. Attention is one of the cognitive abilities that can also decline with age. Five hundred and eighty Israeli adults, ages 20 to 85 responded to a computerized test assessing attention level (Mathematics Continuous Performance Test – MATH-CPT). The participants were divided into seven age groups, each with an age span of 10 years (20-30, 30-40 etc.). The seven age groups were assessed with 11 measures of the MATH-CPT. To reduce a possible Type I error, Alphalevel was set to 0.01. A One-way ANOVA showed that in six measures there was a significant reduction in attention level as a result of growing older. Discriminant function analysis showed that three measures were the most important variables that distinguish attention level between young and older participants. These measures were: overall attention level of the MATH-CPT, measure showing consistency of reaction time, and a measure of impulsivity. The discriminant function analysis found no differences in measures of correct responses and four measures of sustained attention. The authors will discuss that certain measures of attention decline with aging while others remain intact.
DO ATTITUDES REVEAL ‘THE GRASSHOPPERS’? MONEY AND CREDIT CARD ATTITUDES AS PREDICTORS OF IMPULSE PURCHASE

Impulse purchase has a vital part in explaining consumer purchase practices. Even if a host of different factors were shown to be linked with impulse purchase, predicting it still has room for improvement, especially considering the practicality. In this sense, the purpose of the present research is twofold: First we argue that impulse purchase act is associated with attitudes toward money and credit card. Secondly, we aim to investigate the role of hedonic shopping value as a mediator between the proposed attitudes and impulse purchase. This research makes several important contributions to the literature. First by examining the impulse purchase behavior from an attitudinal standpoint, we provide a different framework in predicting it. Secondly, we identify a dispositional factor — hedonic shopping value — between proposed attitudes and impulse purchase which further reveals a condition in explaining the relationship. We conducted the study with a sample consisted of 200 participants. Hierarchical regression analysis results showed that except the anxiety/distrust factor, the retention-time factor of Money Attitudes Scale and negative attitudes and spending factors of Credit Card Attitudes Scale significantly predicted impulse purchase tendencies, supporting our hypotheses. Consistent with our hypotheses, the mediating effect of hedonic shopping value was also supported for the relationship between spending and negative attitude factors and impulse purchase.
The general purpose of this paper is to develop an integrative, biopsychosocial framework of the entrepreneurial personality system and to put parts of this model to an empirical test by using large datasets from various countries. Entrepreneurship research has been diversifying in research approaches on personality-related constructs over the past 20 years. In extending previous efforts to structure components of an entrepreneurial personality, this paper offers an integrative, biopsychosocial framework of what we call the entrepreneurial personality system (EPS). We follow a multi-level system-perspective, which has become the dominating perspective in contemporary personality psychology. Our approach is based on 1) personality theory stressing the importance of the conceptual uncoupling of the single components of an individual’s personality, 2) a biopsychosocial understanding of human development and functioning, 3) the notion of lifelong plasticity in the adaptive part of the EPS, 4) a developmental lifespan approach of entrepreneurship, and 5) the convincing theoretical and empirical arguments speaking for a person-oriented view in personality research. It is postulated that the EPS consists of an enduring core that is substantially rooted in biology: Basic tendencies, which are the basis for the more adaptive parts of the EPS: Characteristic adaptations and the self-concept. Examples of the enduring core of the EPS – the basic tendencies-level – are broad personality traits – the relatively stable, biologically-based individual-difference variables. The most prominent and best-researched traits in personality psychology are the Big Five traits. Today, many personality psychologists agree that each person, in virtually each culture across the globe, can be best characterized in terms of his or her traits by means of this five-factor model. Likewise, research showed that the Big Five relate to entrepreneurship in a systematic way. Characteristic adaptations in the EPS refer to more narrowly-defined and changeable entrepreneurial characteristics such as self-efficacy, need-for-achievement, locus of control, risk-taking (which in prior studies are often called “specific entrepreneurial traits”) but also entrepreneurial attitudes, values, motives, cognitions, and affective states (e.g., entrepreneurial passion) – constructs that figure prominently as proximal predictors in psychological models of entrepreneurial motivation, behavior, and success. The characteristic adaptations in the EPS vary tremendously across cultures, families, and portions of the lifespan because they not only develop out of the basic entrepreneurial tendencies but also in continuous interaction with the social ecology of everyday life (e.g., entrepreneurial stimulations via early socialization experiences, education, work experiences, etc.) and the wider cultural setting (e.g., entrepreneurial cultural norms and habits). The characteristic adaptations are called characteristics because they are the expression of the person’s character (i.e., the basic tendencies-level such as the Big Five traits); they are called adaptations because they are shaped by learning experiences and proximal developmental contexts. The self-concept-level in the EPS refers to an entrepreneurial self-concept, or self-identity, as evolving developmental construct in one’s vocational development over the life-course. It is characterized by a good fit between one’s self-image and the entrepreneurial role. Often, entrepreneurship and related thinking patterns and behavior styles (e.g., creativity, personal initiative, leadership, competition, innovation) can be seen as some sort of a subjective life theme by these individuals in their own decisions, thoughts, feelings, and activities across the different life
stages may often involve some sort of entrepreneurial thinking and acting. The entrepreneurial self-concept involves the individual subjective biography and is deeply rooted in early socialization experiences (e.g., identity theories in developmental psychology deem adolescence and early adulthood as crucial developmental phases in identity development). Within the EPS, the entrepreneurial self-concept develops out of both the basic tendencies and characteristic adaptations. However, it also feeds back to the characteristic adaptations because it guides interactions with the environment. Moreover, external to the EPS, culture affects the self-concept via the proximal social ecology of everyday life (e.g., parenting and education practices, mass media, job experiences, the internalization of social roles, etc.). Adjacent, outer levels of the EPS are the biological system, entrepreneurial agency and experiences, and the wider ecology.

These inner and adjacent levels interact with each other in a characteristic way. Summary of the key propositions of the EPS framework: (1) Scope: The EPS includes a relatively broad, and diverse set of personal characteristics ranging from the enduring core – a substantially biology-based part that is relatively stable over time and describes a person’s entrepreneurial character (basic tendencies: Big Five trait structure) – to more adaptive parts that are prone to considerable change due to their lifelong plasticity (characteristic adaptations, self-concept). (2) Dynamics: The single parts of the EPS steadily interact with each other in a characteristic way over the life-course, as described in Figure 1. The enduring core thus canalizes the development of the adaptive part of the EPS in a certain direction. (3) Boundaries: The EPS is bounded by its adjacent, outer levels: The individual’s biological system (e.g., genes), proximal and distal ecology, and entrepreneurial agency (e.g., entrepreneurial thinking and acting) and experiences. These boundaries are permeable and fluid so that one can only come to a full understanding of the emergence, development, and functioning of the EPS when considering these adjacent, levels too, which calls for (integrative) biological, contextual, developmental, and human agency perspectives in the study of the EPS. (4) The term “traits”: The term “traits” refers exclusively to the basic tendencies-level and thus to the enduring core of the EPS (i.e., Big Five traits). Other more changeable personality characteristics such as need-for-achievement, self-efficacy, risk-taking, locus of control, passion etc. are “trait-like” but should be better labeled as characteristic adaptations. This better illustrates their considerable proneness to change – not independent of the basic tendencies-level, though. (5) The causal personality-entrepreneurial outcomes-relationship: Personality does not affect entrepreneurial outcomes (e.g., entrepreneurial intentions, behavior, and success) in a purely deterministic way as a one-way street. Rather, the personality-entrepreneurial outcomes-relationship is much more dynamic and reciprocal, particularly with regard to the adaptive part of the EPS. There are ongoing transactions between the adaptive part and entrepreneurial outcomes (e.g., self-efficacy leads to success, which in turn promotes self-efficacy and so on). These transactions are affected by the basic tendencies-level (e.g., an entrepreneurial Big Five structure facilitates entrepreneurial adaptations in the adaptive part of the EPS during entrepreneurial work). (6) Person-oriented perspective: The EPS functions as a whole (e.g., the whole is more than the sum of its parts). Hence, one cannot achieve a full understanding of the role of personality in entrepreneurship when not considering a person-oriented perspective that concentrates on the intraindividual dynamics within the EPS and between the EPS and its adjacent, outer levels. Such a person-oriented perspective is particularly fruitful with regard to the basic tendencies-level to describe a person’s basic entrepreneurial character (e.g., entrepreneurial intraindividual Big Five structure). In the empirical part of this paper, we test whether a person-oriented strategy of assessing the basic entrepreneurial character at the basic tendencies-level indeed fits the EPS model better than a variable-oriented strategy, as predicted by the EPS theory. We study the single Big Five and the intraindividual, entrepreneurial Big Five profile as predictors of characteristic entrepreneurial adaptations (self-efficacy, risk-taking, and locus of control) in large national samples from three countries. We utilized data from three national longitudinal studies that included reliable information on both the Big Five personality traits, characteristic entrepreneurial adaptations, and entrepreneurship indicators (in this case self-employment status and entry as proxies for entrepreneurship). These studies are the “German Socio-Economic Panel” (GSOEP), the “Household, Income and Labour Dynamics in
Australia” (HILDA) survey and the “Midlife Development in the U.S.” (MIDUS) study. Specifically, these effects are tested within mediation models with self-employment status and entry as outcome variables. As expected, the person-oriented profile (the intraindividual entrepreneurial constellation of the Big Five traits) delivered the more consistent and robust results than the variable-oriented method (studying the isolated effect of each Big Trait). The entrepreneurial Big Five profile consistently predicted the characteristic entrepreneurial adaptations, which mediated the link between entrepreneurial outcomes and the entrepreneurial Big Five profile. Implications for research and practice are discussed, with an emphasis on a holistic view on the entrepreneurial personality and its interacting sub-components.

DOES NARRATIVE NOSTALGIA DECREASE DEATH-ANXIETY?

A11. General issues and basic processes - Motivation and emotion

Özgen Yalçın, Adnan Menderes University, Aydın – Turkey
Pınar Elmas, Adnan Menderes University, Aydın – Turkey

The previous studies showed that nostalgia, identified as a longing for past (Hepper, Ritchie, Sedikides & Wildschut, 2012), serves psychological functions such as positive mood, high self esteem, powerful social relationships and the perception of meaningful life that facilitates to cope with existential anxieties (e.g., Routledge et al., 2011). Concordantly, these functions of nostalgia reduce death anxiety as well (e.g., Routledge et al., 2008). However, nostalgia studies ignored the anxiety buffering role of nostalgia towards “not directly experienced” past which we call as narrative nostalgia. For closing this gap, this study aimed to observe the effect of narrative and individual nostalgia activation on death anxiety. For this purpose, three experimental groups (individual nostalgia, narrative nostalgia and control group) were constituted in a sample of 150 participants from Adnan Menderes University, Turkey. Death anxiety levels were measured with Death Anxiety Scale (Templer, 1970) just after the nostalgia activations in order to see whether activating different nostalgias effect the death anxiety or not. The results were discussed within the framework of relevant literature.

MEDICAL EXPERTISE BIAS

E16. Health and clinical intervention – Other

Katarzyna Stasiuk, Maria Curie - Sklodowska University, Lublin - Poland
Yoram Bar - Tal, Tel-Aviv University, Tel-Aviv - Israel
Renata A. Maksymiuk, Maria Curie - Sklodowska University, Lublin - Poland

Objective: This study examines the hypothesis that physicians who recommend a more active and major treatment are perceived by their patients as having higher epistemic authority (Kruglanski, 1989). Method: The sample was 631 participants. Data were collected in a between-subjects design, using scenarios that describe a person who suffers from a medical problem and visits a physician (surgeon, orthopedist or dentist). The physician gives passive or active recommendation regarding treatment. The different levels of passive recommendation (against treatment or wait with treatment) and active recommendation (minor procedures, moderate procedures or major procedures) were used. The expertise of the physician was also manipulated. The dependent measure was the patient’s rating of the EA attributed to the physician. Results: Physicians who prescribed an active mode of treatment (regardless of the level of recommendation) were perceived as having a higher EA than physicians who gave the passive recommendation. Conclusions: The authors of research named the phenomena the medical expertise bias - people might be biased when judging the level of expertise of their physicians, so that those who recommend an active treatment are considered to be of greater medical EA in general.

RELIGION, WORK ETHIC, AND ORGANIZATIONAL LEADERSHIP: EVIDENCE FROM PROTESTANT EDUCATIONAL LEADERS IN THE UNITED STATES

D05. Work and organization - Organizational behaviour

Chang-Ho Ji, La Sierra University, Riverside - United States

The aim of the present study was to examine the relationship between personal religiosity and Protestant work ethic as well as their importance to the development of organizational citizenship behavior and transformational leadership. Using a cluster sampling method, a sample of 224 administrators and leaders associated with a large private school system in the United States completed the religious orientation, Protestant work ethic, transformational leadership, and organizational citizenship questionnaires. The results revealed that extrinsic religiosity was significantly and positively associated with Protestant work ethic, which in turn led to the growth of transformational leadership and organizational citizenship. However, no significant relationships were found between Protestant work ethic and conventional forms of personal religiosity such as intrinsic religiosity and personal devotion. This was also the case for the existential quest religiosity. These empirical findings fail to support the popular perception and long-standing socio-religious claim that Protestant work ethic is the product of Protestant religious faith and commitment to the church. This paper also discusses the implication of the findings in the context of psychology of religion and organizational behavior literature.

“THE BOOK OF MANY FACES”: EXAMINING THE IMPACT OF ATTACHMENT ANXIETY, SELF-ESTEEM AND GENDER ON FACEBOOK SELF-PRESENTATION

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Aikaterini Pagoulatou, National & Kapodistrian University of Athens, Athens - Greece
Mari Janikian, The American College of Greece, Athens – Greece
Fotini-Sonia Apergi, The American College of Greece, Athens – Greece
Ion Beratis, The American College of Greece, Athens - Greece.

Facebook is considered a global phenomenon noting explosive growth the last years. Although research suggests that Facebook may serve attachment needs, its examination from an attachment theory perspective is rather new. The aim of this study was to investigate the relationship among attachment (at.) anxiety, self-esteem, gender and Facebook self-presentation, and explore the unique contribution of at. anxiety in self-presentation. Self-report anonymous questionnaires were completed online by Greek participants (N = 248). Results demonstrated that females had significantly higher levels of promoting self-presentation compared to males (t = 3.39, p < .001), suggesting that for women, self-presentation is more intense and strongly associated with attempts at impression management. Participants with one account showed lower levels of at. anxiety compared to users with more accounts (t = -2.22, p = .036). The hierarchical regression model revealed a significant capacity of at. anxiety in predicting promoting self-presentation (R2 = .38, F (4, 243) = 37.59, p < .001). Participants high in at. anxiety engaged in self-presentation by trying to appear more attractive and competent. Our findings offer preliminary support for models that highlight attachment needs in virtual self-portrayal. Future research extending these findings among other samples and employing multi-method assessment would serve to further clarify the tenability of attachment theory in the use of social networking sites.
SOCIAL ICONIC METAPHORS IN SELF-OTHERS AND GROUP RELATIONS

What are social iconic (pictorial) metaphors (SIM) generated by insiders for visually representing social relations? The research is carried out within the context of pictorial methods of studying self-others relations and their social representations (Aron, 1992; De Rosa, 1982, 1996; Forceville, 2009; Josselson, 1992; Mamali, 1986; 1992; Pipp & Shaver, 1985; Sen & Wagner, 2004). The SIM construct integrates research on visual representations on human relations with that on metaphors (Black 1962; Forceville, 1988; Gibbs, 2008; Giora, 2008; Johnson, 2008; Kövecses, 1995; Lakoff, 1980, 2009; Meyer, 2006; Ortony, 1975), on verbal social metaphors (Suitner & Maass, 2013) and with that on “pictorial metaphors” (Forceville, 1996). It is claimed that SIM produced by the social autograph method (Mamali) are able to approach relational issues that are not identifiable by mere verbal methods. A SIM is a metaphor generated by insiders using images instead of words for representing individual and group relations. Findings of 4 studies (N=1009, from Romania and USA) suggest that: a) insiders generate spontaneously SIM; b) the use of SIM increases in the case of informal versus formal relations; c) the most frequent types of SIM are biological, mechanical, constructions and mixed; d) SIM of higher personal significance include deceased persons, pets and transcendental forces - God; e) SIM are used to express critical views on group relations under repressive social conditions.

PHYSICAL LOAD AFFECTS DURATION JUDGMENTS: A META-ANALYTIC REVIEW

A07. General issues and basic processes - Sensation, perception and space

Dan Zakay, Interdisciplinary Center Herzliya, Herzliya – Israel
Peter Hancock, University of Central Florida, Miami - United States
Richard Block, Montana State University, Bozeman - United States

Meta-analytic research on time perception is presented. In a previous meta-analytic review, the authors reported that cognitive load influences prospective duration judgments. Not much is known about the impact of physical load on prospective duration judgments. This issue is important from both theoretical and applied perspectives. People encounter daily situations in which they have to rely on duration judgments while subject to physical load. In the present study effects of physical load on prospective duration judgments were investigated in a quantitative (meta-analytic) review and also a qualitative review. The quantitative analysis included seven experiments, with a total of 235 participants. A qualitative assessment of related studies that were not includable in the quantitative meta-analysis is also provided. All quantitatively analyzed experiments used the prospective duration-judgment paradigm and the duration-production method, in which participants knew in advance that duration estimation was required. Physical load was manipulated by various methods. A large overall effect size reveals that increasing physical load results in longer prospective duration productions. Physical load exerts similar, although larger, effects than those of cognitive load. Implications for applied cognitive science research, theories, and applications are discussed. The findings contribute to the study of duration judgment processes.

SEXOMNIA STUDIES IN TURKEY: A LITERATURE REVIEW

Irmak Dedecan, Ministry of Family and Social Policies, Beylikdüzü Care and Social Rehabilitation Center, Istanbul - Turkey
Sinem Cankardeş, Istanbul Arel University, Istanbul - Turkey

Objective: Sexomnia (also known as sleep sex) is defined as unintentional sexual behavior or activities during sleep. The purpose of this literature review is to form an opinion regarding sexomnia studies conducted in Turkey. Sexomnia is not a well-known disorder. There are a limited number of studies exploring and explaining the etiology and treatment of it. In addition, there are not enough case studies detected in Turkey as well as in other areas of the world. Following is a discussion on what has been covered in Turkey regarding case studies, treatment and etiology research. Our aim is to summarize what has been done and direct future studies related to the topic. Method: Resources utilized include peered reviewed journal articles, internet web sites, and text books. Search engines included TUBITAK National Academic Network and Information Center Database, Google Scholar, PubMed, Turkey Citation Index. The articles were in English and Turkish. Results: The definition of sexomnia is available to researchers, as well as public. However, it is not a well-known phenomena in Turkey. There is a very limited number of studies on this matter. Although in general literature, sexomnia is reported to be more common in men, three quarters of the cases reported in Turkey are women. Further research and case studies are needed. Conclusion: Conducting more studies on sexomnia is required to attract more attention to the topic as well as contributing to etiology and treatment methods.
Motivational balance (MB) is a dynamic outcome of the interactions among qualitative (intrinsic versus extrinsic motives) and quantitative (valence, expectancy and agency) of motivational forces at intra-individual level, across the activities of one person, at inter-individual and inter-groups levels. A measurable motivational vector includes a qualitative (structural) and a quantitative (infrastructural) side. The MB model is indebted to: a) expectancy theories and value models (Vroom, 1964, 2005; Atkinson, 1964; Ecless, 2005; Higgins, 1998, 2012; Heckhausen, 1991); b) self-determination theory (Deci & Ryan, 1985, 2000; c) Lewin’s theory (1935, 1951); d) Heider’s theory (1946); e) Homans’ exchange theory (1961); interdependence theory (Kelley & Thibaut, 1978); f) hierarchical models (Thoreau, 1854; Maslow, 1954); levels of social complexity (Hinde, 1979). At dyadic level MB varies between: a motivational co-regressive state, both actors move down in their motivational hierarchies and a motivational co-developmental state, both sides move together to higher motivational levels. The MB model predicts that the probability to reach a co-developmental motivational balance among all the actors decreases exponentially with each new individual added to a given field. Findings from a two-wave study on a national sample of scientific researchers (T1 = 618, T2 = 378) support the model. A formal expression of the MB model for fields with n actors is presented.

THE ADDICTIVE NATURE OF SOLARIUMS: ATTITUDES AND EXPERIENCES OF REGULAR FEMALE TANNERS

Paul Chang, Edith Cowan University, Perth - Australia
Bianca Mancini, Edith Cowan University, Perth - Australia

The use of solariums to get a tan is still popular in Australia, despite the fact that artificial ultraviolet radiation emitted in solariums is exceptionally dangerous, even more so than the sun. Solarium users have a 75% increase in the risk of developing a melanoma compared to those who do not use the solarium. In the past, quantitative surveys have investigated some of the motivations and prevalence of solarium use. However, almost no research is reported about the experiences of regular tanners who use solariums. The present study adopted a qualitative approach with in-depth interviews to explore the attitudes and motivations of solarium users. Nine females who used solariums at least once a week were interviewed. In addition, an ultraviolet photoaging camera was employed as an interview tool to allow participants to see any premature aging as a result of their solarium use. Four core themes of Positive Reinforcers, Positive Punishment, Knowledge, and Behavior Change emerged from the interview data. The implication of these results was that regular solarium users were highly driven by social perceptions concerning attractiveness with some users indicating that they were addicted to solarium tanning. An interesting finding from the interviews was that the threat of premature aging, as demonstrated by the photoaged image did not actually deter tanning behavior, but rather paradoxically, simply highlighted blemishes that could be corrected by plastic surgery.

COMMON ISSUES FOR SOCIAL CONSENSUS BUILDING OBSERVED IN DIFFERENT SOCIAL PROBLEMS RELATED TO ENVIRONMENTAL POLICIES

F22. EXPO 2015 Hot Topics - Sustainability and mindfulness

Etsuko Yoshida, Tokyo University, Chiba – Japan

This study extracts issues for social consensus building commonly observed in different social problems related to environmental policies and examines how unbiased value judgment of environmental policies could be achieved. As the social problems subjected to this study, three specific problems related to prevention of natural disaster, environmental pollution and infrastructure development are taken. The three problems have, on the one hand, issues unique to themselves, but, on the other hand, if we look at the three problems beyond boundary such as mechanism of problem occurrence, institutional unfairness or communication among stakeholders, governments and scientist, we expect that we could find issues commonly applicable to all the three problems, from which we may be able to find ways to improve the current symptomatic management of environmental policies. In order to achieve this objective, we conduct bibliographic survey of each of the three specific problems, attend and observe symposiums in which victims of the subjected environmental problems make presentations and conduct questionnaire surveys of anxiety and self-efficacy to general public about their involvement in the making process of policies concerning environmental problems to reveal psychological process of feeling of resignation of victims. The results reveal that due consideration of social needs and victims’ resigned feelings are needed for unbiased value judgment of environmental policies. Key words: environmental problems, social consensus building, environmental policy, common environmental issues, value judgment of environmental policy.
Awakening elicits a marked surge in cortisol secretion: the CortisolAwakening Response (CAR). This vital hormone affects multiple body organs, synchronising optimal daily functioning, with the CAR linked to mental and physical health. A popular biomarker, assessable from saliva samples collected at home, but with dubious reliability linked often to researcher ignorance of real sampling times, the CAR has spawned a worryingly inconsistent literature, hindering interpretative review, and wasting resources. We have undertaken an intensive study in the domestic setting on 20 healthy males and females. Saliva samples were collected on awakening and at 5 min intervals for the first 60 min post-awakening. Objective monitoring of awakening and sampling points was determined with electronic devices. Preliminary results indicate a time lag between awakening and start of cortisol rise indicating that the cortisol rise is not linear and this has implications for the accurate measurement of the CAR and its interpretation. Short sampling delays, of just 8 min, previously thought to be acceptable, result in increased CAR magnitude and earlier cortisol peak. These results will offer insight into the best measurement solutions for this often used biomarker in large studies providing guidelines on the balance between cost and accuracy trade-off. Only such solutions will provide meaningful data which will advance our understanding of the CAR as a unique aspect of the diurnal pattern of cortisol secretion.
O1553
WHAT IS THE CURRENT VALIDITY STATUS OF DIGIT RATIO (2D:4D) AS A RETROSPECTIVE MARKER FOR PRENATAL ANDROGEN ACTION?

A04. General issues and basic processes - Psychobiology

Martin Voracek, University of Vienna, Vienna - Austria
Ulrich S. Tran, University of Vienna, Vienna - Austria

Prenatal androgen action (PAA) has long-lasting, permanent (i.e., organizational) effects on the brain, behavior, and disease susceptibility postnatally. Central insights in this field are due to animal experiments (which may not be directly translatable to humans) and early manifesting endocrine disorders (which experiments of nature have their own limitations), whilst human PAA measurement is intractable and human PAA experimentation ethically impossible. Owing to these research barriers, having valid retrospective PAA markers would be of great value. With about 1000 research reports since 1998, the second-to-fourth digit ratio (2D:4D) presently is by far the most frequently investigated candidate retrospective PAA marker. Despite its popularity, the usefulness of 2D:4D is continues to be discussed controversially in the literature, and surprisingly little effort has been made to evaluate its validity systematically. Most recently, the much-cited central validity claim of 2D:4D associations with genetically based (androgen receptor gene variants) testosterone sensitivity has been disproved meta-analytically (Voracek, 2014; Evolution and Human Behavior 35:430-437). We undertook the first comprehensive evaluation of the validity status of 2D:4D (systematic review and meta-analyses of 60+ studies) and show that the actual validity status of 2D:4D is notably weaker and more uncertain than stated in the 2D:4D literature. Implications of these novel findings are discussed.
BILINGUALISM = BICULTURALISM? REFLECTIONS ON THE RELATIONSHIP BETWEEN LANGUAGE AND CULTURE

Elke Murdock, University of Luxembourg, Luxembourg - Luxembourg

Luxembourg has three officially recognized national languages (French, German, and Luxembourgish); at least two of these are used in everyday interactions by Luxembourgers and the non-resident population. A series of empirical studies using quantitative as well as qualitative methodology tested the relationship between bilingualism and biculturalism. The first study (N = 99 students) addressed tri-lingual Luxembourg nationals. The results of this quantitative study showed that the vast majority of the Luxembourg participants consider themselves to be multi- or bilingual, though they report to feel monocultural. The qualitative findings obtained in this study indicate that language was considered to be a necessary, but not sufficient condition for multiculturalism. In line with other research on biculturalism, the results showed that biculturalism requires cultural immersion to take place. Furthermore, for those who feel bicultural, language is considered a prime for cultural frame switching. This implies that the language prompts the cultural frame switching and the switching between languages does not require conscious efforts. This difference of perception of language as a cultural prime as opposed to language as a means of communication was also confirmed in a study among adolescents (N = 204) and a study among adults (N = 504). Implications are discussed for increasingly diverse, multi-lingual societies.
O1555
A COMPARISON OF ABBREVIATED FOUR-WEEK MINDFUL PARENTING PROGRAM WITH THE EIGHT-WEEK MINDFUL PARENTING PROGRAM IN HONG KONG, CHINA

F22. EXPO 2015 Hot Topics - Sustainability and mindfulness
Ying Ma, The Chinese University of Hong Kong, Hong Kong - Hong Kong

Mindful parenting is a relatively new extension of mindfulness-based interventions. Mindful parenting program is beneficial for parent themselves and the relationship between parents and children. Previous research has indicated that 8-week mindfulness program is effective to help parents decrease stress and enhance well-being. However, as 8-week is difficult for some parents to stick it out. In our study, we intend to conduct two groups of mindful parenting intervention program to compare the effect of an abbreviated 4-week mindful parenting intervention program with the normal 8-week program. Our mindful parenting program is based on the guide of mindful parenting developed by Bögels and Restifo (2014). In our first group, we will compress the 8-week program to 4 sessions to investigate the effect of some core mindful parenting activities including sitting and walking mediation, bodyscan, raisin exercise, morning stress exercise and so on. In our second group, we will conduct the normal 8-week mindful parenting program. We will use apre-post design. A total of 12-16 parents of children (5-8 years old) will be invited to participate in each group. They will complete the questionnaire before the program and the same set of questionnaire after the program. The measures will include mindful parenting, mindful attention awareness, perceived stress, general health and parenting efficacy. We expect this program is effective in alleviating parental stress and enhance parenting efficacy and parents’ general health. What’s more, we expect the 4-week program is also effective as the 8-week program. It’s important to the accessibility and generalizability of the mindful parenting program.
O1558

DEVELOPMENT AND EMPIRICAL EVALUATION OF A PSYCHOLOGICAL WELL-BEING AT WORK STRUCTURAL MODEL

D04. Work and organization - Well-being at work

Gina Görgens-Ekermans, Stellenbosch University, Cape Town - South Africa
Boers Maritsa, Stellenbosch University, Cape Town - South Africa

Set within the theoretical frameworks of Positive Organisational Behaviour (POB) and the Broaden-and-Build theory (Fredrickson, 2001) the goal in this study was to explicate the nomological net of variables underlying Subjective Well-being (SWB) and Psychological Well-Being at Work (PWBW). SWB was defined as both Hedonic Well-being (HWB) and Eudaimonic Well-being (EWB). Well-being was contextualised in the work domain with Dagenais-Desmarais and Sovoie’s (2012) PWBW construct. It was hypothesised that hopeful, optimistic, self-efficacious, resilient employees (PsyCap; Luthans, Avey & Avolio 2007), that show Gratitude (McCullough, Emmons & Tsang, 2002) and are engaged (Schaufeli & Bakker, 2003) in their work; perceive organisational support (Eisenberger, Huntington, Hutchinson & Sowa, 1986) and report Psychological Ownership (Pierce, O’Driscoll & Coghlan, 2004) of their jobs, will experience greater levels of PWBW, mediated through better EWB and HWB (as a combination of more Positive affect and less Negative Affect). The fit of the structural model (RMSEA = 0.0748; NNFI = 0.97; CFI = 0.97; SRMR = 0.067) was tested with data derived via a survey (n=199, collected via Facebook). The results revealed that different positive psychological resources predicted different aspects of well-being. Optimism played a very central role in overall well-being. Strong support for the effect of Work Engagement and Perceived Organisational Support on well-being emerged.

NUTRITIONAL EMERGENCY PREPAREDNESS IN GERMANY

E14. Health and clinical intervention - Disaster and crisis psychology

Stefanie Wahl, Free University Berlin, Berlin - Germany
Lars Gerhold, Free University Berlin, Berlin – Germany
Ute Menski, Free University Berlin, Berlin – Germany
Hagen Tischer, Free University Berlin, Berlin – Germany

The protection of food supply as a crucial infrastructure is a central subject of the security policy of Germany. Nevertheless, the currently valid political and juridical measures are not sufficient anymore under today's conditions in order to guarantee the safety of the population in the case of crises. The talk presents preliminary results of a representative study conducted in Germany in 2013 (N=3,000) that tries to identify the capabilities and limits of private food provisions, as well as vulnerable groups in case of provision shortages. The quantitative questionnaire was realized as part of the interdisciplinary research NeuENV, which develops new strategies of the food emergency precaution in cooperation with all relevant stakeholders: with enterprises of the food chain, political decision-makers, aid organizations and the population as an addressee of the food supply. Theoretically the study is based on the risk perception framework by Slovic (1993, 2000) and Renn (2007, 2013). The discussion of the presented results focuses on how people behave (how many food they buy daily/weekly/monthly and what they have in stock) and how relevant they think their behavior is in case of crisis. The talk includes statistical data on selected aspects that will be presented in figures and numbers and interpreted in context of the named theories. The discussion focuses on the relation between laymen and professional knowledge on nutritional emergency preparedness.
Purpose of the study: to reveal psychological factors that promote or hinder the digestion of visual educational information presented to students in different forms by means of multimedia presentations. Three lectures-presentations on the three subjects «Abilities», «Temperament» and «Character» (each in the form of text, schemes, comics) were created and used in the learning process. The dynamics of digestion was recorded through concept maps created by students (N=166 faculty of applied mathematics and control processes; N=111 faculty of biology) before and after studying each subject, and through the tests developed on the basis of Bloom's taxonomy. To identify psychological characteristics of students we used psychodiagnostic methods. Cognitive and metacognitive skills, learning motivation, characteristics of self-organization were studied (54parameters). Factor, regression, discriminant analysis were used. The ability to self-organization is a key factor in effective digestion of visual educational information in the form of text in e-learning for students. Students with idealistic thinking style and demonstrating the presence of such learning motives as avoidance of failure and self-actualization digest information better if it was presented in the form of schemes. Motivational, communicative, evaluative components of learning activity and also learning conditions are significant for students with a high level of digestion of information in the form of comics. The study was supported by the Russian Foundation for Humanities, project 14-06-00521 «Neuropsychological mechanisms of complicated kinds of intellectual activity developing in the higher school education»
Despite a long theoretical debate, most of creativity research has so far focused on individual creativity with little emphasis on group creativity (Paulus & Nijstad, 2003). Flow, “an almost automatic, effortless, yet highly focused state of consciousness” (Csikszentmihalyi, 1996, p. 110), is an important aspect of group creativity (MacDonald et al., 2006). However, compared to individual flow, there are only few group flow studies (Hart & DiBlasi, 2013). What factors and processes produce group flow? Theories and empirical studies pointed to the importance of processes, such as empathy (Hart & DiBlasi, 2013) and familiarity of group members as important experiences related to group flow. The present research assessed the role of empathy and familiarity to the group flow experiences from different creative domains. The current longitudinal studies investigated “group flow” with both quantitative and qualitative methods. In Study 1, group flow was investigated with 90 members of student societies at a UK University. Orchestra musicians, dancers, and musical actors were given questionnaires on their group flow experiences and empathy after practices at three time points. In Study 2, 5 participants from each society were invited to open-ended interviews about group processes, flow, empathy and familiarity within one week after their each practice. Results from both studies highlight the importance of empathic connection and familiarity of group members in group processes and flow.
The aim of this paper is to illustrate an association between art making and the brain state known as flow, a psychological construct defined by Mihaly Csikszentmihalyi. Flow denotes, amongst others, sensations of effortless action and being ‘in the sweet spot’. Links exist between artists’ perceived propensity to experience flow and experimental data of the same art-making events. Neural and cognitive processes underlying flow position the predominantly psychological concepts of flow in the domains of neuroscience. A key aspect for understanding the flow experience is Arne Dietrich’s hypothesis of transient hypofrontality, enabling the temporary suppression of the analytical and meta-conscious capacities of the explicit system. In this study, transient hypofrontality was found to be germane to interpretations of flow and art making. To establish a link between flow and art making, a mixed methods approach was employed, utilising qualitative as well as quantitative data collection methods. Semi-structured interviews established an association between phenomenological elements of flow and art making. Electroencephalography (EEG) data collection was used to compare the participating artists’ brain wave activity during art making and to establish whether brain wave patterns could yield themes associated with flow. Cortical electrical activity of various brain frequencies were equated with neural and cognitive explanations of flow.
O1580

AN INVESTIGATION INTO THE IMPACT OF A FATHER’S ABSENCE ON AN ADOLESCENT’S RESILIENCE

E09. Health and clinical intervention - Positivity and well-being

Keith Arnolds, NMMU, Nelson Mandela Metropolitan University, George - South Africa
Bridget Johnson, NMMU, Nelson Mandela Metropolitan University, George - South Africa
Roelof Steyl, NMMU, Nelson Mandela Metropolitan University, George - South Africa
Charlon Barnard, NMMU, Nelson Mandela Metropolitan University, George - South Africa

Various studies have been conducted in an attempt to understand the effects of the absence of a father on an adolescent’s participation in risk behaviours. This study attempted to understand the effects of the absence of a father on an adolescent’s resilience. A resiliency framework encourages researchers to focus on positive factors and develop strategies to enhance strengths despite exposure to risks. A total of 100 grade 10 learners aged 15 to 19 years at two high schools in the Southern Cape, South Africa, participated in the study. Two self-report quantitative measures were used to obtain the data. A questionnaire was developed by the researchers to obtain information about participants’ personal and family circumstances. In addition, the Connor-Davidson Resilience Scale (CD-RISC 25) was utilised to measure resilience. The findings revealed that the adolescents with absent fathers had lower resilience scores than adolescents with fathers who were not absent. The findings also indicated that the reason for the father’s absence had an impact on the adolescent’s resilience score. Furthermore, emotional availability despite physical absence was an important factor. This study therefore highlights the important role of fathers in fostering resilience amongst adolescents and argues that the reasons for a father’s absence as well as emotional availability are important factors to be considered.
Training is one of the strategic topics in the working policies, because of the importance for the employees to be continuously updated in their professional competences. The preliminary aim of the study has been to identify which are the possible constructs to understand the role of training and learning in the organizations and how do they influence the organizational culture. Although in literature there are several constructs related to this topic (learning culture, training climate) there is not a clear and shared theoretical frame about it. The proposal of this study is to introduce the concept of training culture, which describes the perspective that organizations adopt with regards to how professional training is considered (relevance, role), with implications to training design and implementation. Perspectives that will be different from country to country, since national cultures will play a role in shaping people's views of professional training. The study was conducted in six organizations, providing training in healthcare sector. The preliminary result of the paper is to present how the training is considered in these organizations, which are the dimensions able to describe the meanings attributed to it, and a set of indicators able to categorize it. Moreover, the most interesting association between training culture dimensions with other variables as gender, age, profession, length of service, number of training hours, state some implications to practice and theory.
O1583
SIGNATURE STRENGTHS AND CAREER ANCHORS OF “BORN FREE” HOSPITALITY MANAGEMENT TRAINEES WITHIN A SOUTH AFRICAN CONTEXT

F01. EXPO 2015 Hot Topics - Capacities building and human development

Ita Geyser, University of Johannesburg, Johannesburg - South Africa
Madelyn Geldenhuys, University of Johannesburg, Johannesburg - South Africa

Orientation: Signature strengths enables students to recognise, comprehend and influence their passion, as well as their strengths, which allows their distinctive brilliance to develop and sets them on a path for success in their respective careers within the hospitality industry. Career anchors highlights areas of proficiency, intentions and beliefs. Research purpose: The aim of the study was to investigate whether there was a signature strength as well as a career anchor profile of a hospitality student within the South African context as the first generation of “born free” students, who were born from 1994, and who has only ever lived in a democracy are attending higher educational institutions in South Africa. Motivation for the study: The “born free” generation within the South African hospitality industry has unique strengths as well as career anchors which could be considered within the workplace to enhance guest experiences and worker retention. The purpose was to investigate the specific strengths and anchors specific to the hospitality management environment. Research approach, design and method: A quantitative approach was used to gather the data for the study, and a cross-sectional survey design was employed. The first sample (n = 108) measuring signature strengths and the second sample (n=57) measuring career anchors consisted of hospitality management trainees from a tertiary institution in Gauteng, South Africa. The VIA character strengths survey as well as the Career Anchors Inventory were used to gather the data. Main findings: The results suggested that honesty was the top strength, followed by love in the second place, humour and fairness shared the third place, gratitude the fourth place and kindness and spirituality shared the fifth place. The lowest scoring strengths amongst these participants were love of learning, creativity and curiosity. A large percentage of the participants were women in their early twenties. Regarding career anchors, entrepreneurial creativity measured the highest and lifestyle measured the second highest as career anchors in the hospitality environment. Security and service/dedication to a cause measured third and fourth highest in the hospitality environment. Practical/managerial implications: Hospitality management trainees who enter the service industry should be aware of their own personal strengths and their career anchors. By combining these two favourable, intangible guest experiences are created, thereby ensuring repeat business in the long term. Contribution/value-add: This research contributes to the uniqueness of signature strengths and career anchors of the “born free” generation within the hospitality industry as they bring other strengths to the service industry when compared to previous generations. The signature strengths and career anchors adds to the body of knowledge on positive work experiences within a service industry.
O1584
SOCIAL PSYCHOLOGY AND WELL-BEING: A SITUATED FRAMEWORK FOR FLOW OF CONSCIOUSNESS

E09. Health and clinical intervention - Positivity and well-being

Paolo Inghilleri, University of Milan, Milan - Italy
Eleonora Riva, University of Milan, Milan – Italy
Marco Boffi, University of Milan, Milan – Italy
Nicola Rainisio, University of Milan, Milan – Italy

Well-being and Flow of consciousness research (Csikszentmihalyi, 1975, 1990, 1997) is traditionally focused on subjective experience, with less concern for the broader social context. We introduce a situated framework of research, and we assign a central role to Flow in generating social change. Optimal experience is one of the main mediators of the relationship between the individual and the cultural system, as a trigger of the psychological selection (Csikszentmihalyi,1990; Inghilleri,1999). Hence, some artifacts of our culture are selected according to their ability to generate Flow, whereas others are set aside (Csikszentmihalyi & Massimini,1985). On the other hand, our socio-physical environment may be considered as an artifact, since both physical spaces and social organizations are basically produced by culture (Rainisio & Inghilleri, 2013): social and physical environments are continuously modeled through optimal experience and its social dissemination. This perspective is supported by research data from three different areas of study: a) the main role of Flow in influencing place attachment and environmental preference; b) Flow experience as basis of social engagement, outlining group settings able to involve new citizens and sustain their commitment through time; c) studies on daily experience of adolescents in different contexts demonstrate that Flow could be used as a planned tool to trigger community renewal and social empowerment.
While drug use amongst adolescents is a major problem worldwide, South Africa has its own unique problems due to its specific Apartheid history and subsequent social challenges. This study attempted to explore the causes and effects of addictive substance use amongst learners in various Southern Cape schools. The study sample comprised of 206 learners from 6 grade 10 classes at 4 high schools. A mixed method design was employed. A self-report questionnaire with both open-ended and closed questions was developed and utilised. Furthermore, semi-structured interviews were conducted with the principals of the participating schools. The findings revealed that substance abuse, particularly the abuse of alcohol, is a problem at most schools; learners from rural areas are more at risk; and that poverty places learners at greater risk for abuse of substances. Of concern is the fact that learners do not think that substance abuse is a problem and that they may require help. Furthermore, they do not trust their schools’ helping systems. The interviews with the principals revealed that the use of addictive substances by learners has a negative effect on the school as well as the community. Since the study found that the causes and effects of addictive substance use are different for various communities, it is recommended that schools consider counter measures that are tailored to their specific circumstances in order to combat the problem.
In China, more than 9 million students attend the college entrance examination each year. Academic achievement has been regarded as the most important admission indicator. So is pay high attentions by schools, teachers as well as parents. The study is the main source of mental pressure, especially for those students who will prepare for college entrance examination. Therefore, research on relationship between academic stress and academic achievement of this group is with high practical valuable. In addition, with the development of positive psychology, resilience as the core concept of positive psychological quality has been paid more attention, it focuses on the good adaption of people when put under pressure and setbacks, the fruits of research on resilience are of certain realistic significance to the improvement of people’s compressive ability and academic achievement level. The instruments used in this study consist of the following questionnaires: (1) Health Kids Resilience Assessment (Chinese revised edition) and (2) Middle school students academic stress scale. Participants of the investigation were 800 students, who are grade 3 from Maotanchang high school, knows as “Asian college entrance examination factory” and another school in Anhui province. 40 participants were selected for in-depth interview, and the data were coded. We get three tests scores on different time point as the academic index. The results are as follows: (1) Family factors as the protective factors of resilience, have positive effect on resilience of candidates for college entrance examination. (2) Academic stress and resilience are predictors of academic achievement. (3) Resilience plays a moderating role between academic stress and academic achievement, but the moderating effect of different dimensions cannot be done in parallel. Through the analysis of the results, the adverse impacts caused by external pressure on academic achievement can be alleviated, via promoting students resilience. Especially the effects of family factors, self-efficacy dimension are obvious. The study deeply explored the role of resilience between academic stress and academic achievement, which enriched the theory of resilience and provided quantitative data on the resilience of each dimension in the relationship between academic stress and academic achievement. And current studies make it is easy to understand why the students of Maotanchang middle high school get big success on the college entrance examination. It also can give some enlightenment to educators on how to make effective adjustments on the psychological development of the students.
The purpose of this study was to examine the moderating role of explanatory style on the relation between family atmosphere and depression in fifth and sixth graders. In the reformulation of the learned helplessness model, explanatory style was a cognitive vulnerability factor contributing to depression. Specifically, a cognitive style that attributed negative events to internal, stable, and global causes was associated with depression. In this study, negative family atmosphere was viewed as negative daily events for some children. Previous studies have found significant links between children’s self-reports of family atmosphere and children’s psychological adjustment. The sample consisted of 464 5th and 6th graders. In the hierarchical regression model, depression as the dependent variable, gender, family atmosphere, explanatory style, the interaction between family atmosphere and explanatory style were entered in order as predictors. Results indicated that (1) after controlling for gender, family atmosphere and explanatory style significantly predicted children’s depression level, and (2) interaction term was significant. Post hoc analyses showed that, for pessimistic and normal explanatory groups, family atmosphere significantly predicted depression level. The worse the family atmosphere was the higher children’s depression levels were. However, for optimistic explanatory group, family atmosphere did not significantly predicted children’s depression level. The result indicated that optimistic explanatory style moderated the relations between negative family atmosphere and children’s depression. Our findings are useful in assisting children who are experiencing stressful family events. Keywords: depression, early adolescence, explanatory style, family atmosphere.
THE EFFECTS OF CHARISMATIC TRAINING STYLE ON TRAINING OUTCOMES: THE MODERATING ROLE OF TRAINER GENDER

Foroogh Bakhtiari, Payame Noor University, Tehran - Iran

This study examined the influence of charismatic trainer behaviors such as visionary content, intellectual stimulation and individual attention on self-efficacy and cognitive learning as training outcomes. Moreover we examined how charismatic training style and trainer gender interact and influence on training outcomes (self-efficacy and cognitive learning). A 2×2 factorial design with pre-test and post-test was used to test research hypotheses. Charismatic training styles and trainer gender were considered as independent variables and self-efficacy and cognitive learning were dependent variables. The sample was comprised 60 female undergraduates who were assigned in 4 groups randomly (charismatic vs. non-charismatic behaviors, and a male trainer vs. a female trainer). Trainers (male or female, charismatic or non-charismatic) presented a 45-minute training program. The training program involved instruction of basic and advanced functions in SPSS, such as how to enter data, to define variables, and to analyze data. To gather the data self-efficacy scale-eight items adapted from Quiñones (1995) and a cognitive learning test were used. Mancova results showed that charismatic training style had a positive effect on both self-efficacy and cognitive learning. Moreover the interaction between charismatic training style and trainer gender was statistically meaningful only for self-efficacy. Keywords: Charismatic training style, self-efficacy, cognitive learning, trainer gender
SHAME-PRONENESS IN PATIENTS WITH ALCOHOL USE DISORDER: GENDER DIFFERENCES

Elsa Taschini, Sainte-Anne Hospital, Paris - France
Alain Dervaux, Sainte-Anne Hospital, Paris – France
Marie-Chantal Bourdel, University of Paris 5, Paris – France
Jean-François Verlhiac, University of Paris 8-Paris 10, Paris – France
Xavier Laqueille, Sainte-Anne Hospital, Paris – France
Isabel Urdapilleta, University of Paris 8-Paris 10, Paris – France

Background: few studies found that shame-proneness and guilt-proneness were associated with alcohol use disorder (AUD) (Dearing 2005; McGaffin 2013). To our knowledge, no study investigated gender differences on this topic. The objective was to investigate gender differences in shame and guilt in patients with AUD. Methods: a group of 40 patients (Male=20; Female=20) from the substance abuse department at Sainte-Anne Hospital (Paris, France) with an AUD (DSM-5 criteria) was compared to a group of 40 control subjects (Male=20; Female=20). The patients were assessed using self-report questionnaires test of self-conscious affect-3 to assess shame and guilt, State-Trait Anxiety Inventory, Beck Depression Inventory, and Rosenberg Self-Esteem Scale. Results: the mean age of the patients was 46.6 years (SD=11.0). After adjusting for age, shame and guilt scores were higher in the group of female patients than in the group of female control subjects (respectively, shame: 43.6 ± 8.2 vs 39.5 ± 7.8, ANCOVA: F(4,75)= 4.31, p=.04; guilt, 64.2 ± 7.7 vs 59.2 ± 9.4, ANCOVA: F(4,75)=4.20, p=.04). In the group with AUD, the scores of shame were significantly higher among female patients than among male patients (respectively: 43.6 ± 8.2 vs 36.8 ± 8.6, t(38)=-2.583, p=.01). Conclusions: the scores of shame were higher among female compared with male patients with AUD. These findings emphasize the importance of trying to reduce the effects of shame and guilt on people with an AUD, especially women.
HOW MOTHERS’ SELF CONSTRUALS PREDICT THEIR OWN AND DAUGHTERS’ GENDER RELATED EVALUATIONS

Hatice Işık, Middle East Technical University, Ankara - Turkey
Basak Sahin-Acar, Middle East Technical University, Ankara – Turkey

The aim of the current study is to investigate whether mothers’ self-construals (individuation & relatedness) would predict their own and their daughters’ evaluations and justifications (moral, social-conventional, personal) for gender related situations (gender inconsistent, gender consistent, gender based parental restriction). 168 third-grade Turkish female students (M = 8.91, SD = .37), and their mothers (M = 37.38, SD = 5.25) participated in the current study. Balanced Integration Differentiation Scale (Imamoğlu, 1998; 2003) and six hypothetical gender related vignettes (Park, Lee-Kim, Killen, Park & Kim, 2012) were used. The results indicated that mothers’ individuation level only predicted their own supportiveness for gender inconsistent (β = .24) and gender based parental restriction situations (β = -.15). However, in gender inconsistent situations, mothers’ individuation scores significantly predicted their own personal (β = .30) and social-conventional (β = -.19) justifications and their daughters’ moral (β = .16) and social-conventional (β = -.14) justifications. Similarly, mothers’ and children’s moral (βm = .23; βc = .16) and social-conventional (βm = -.24; βc = -.18) responses were significantly predicted by mothers’ individuation level in gender based parental restriction situation. This study shows up to what extent mothers’ self-construals influences their gender related evaluations and how they transmit their gender related justifications to their daughters.
O1619
WHICH IS WORSE: HOSTILE OR BENEVOLENT SEXISM? THE RELATIONSHIPS AMONG SEXISM, SYSTEM JUSTIFICATION AND ACADEMIC PERFORMANCE

C03. Culture and society - Sex and gender

Deniz Enic, Uludağ University, Bursa - Turkey
Leman Pınar Tosun, Uludağ University, Bursa - Turkey

According to the Ambivalent Sexism Theory, benevolent sexism may sometimes lead more negative consequences for women than hostile sexism. The present study aims to test the hypothesis that benevolent sexism may have a more detrimental effect on women's math performance than hostile one. A second aim is to look for a link between sexism and system justification tendencies. According to System Justification Theory, people justify gender-specific system by endorsing complementary stereotypes (e.g.; Men are better than women in math, and women are better than men in verbal skills). In this study, women's math and verbal performance will be measured. In line with the prediction of the theory, we expect that benevolent sexism will negatively affect women's math performance, but not verbal test. Data will be collected from 180 female college students. They will be asked to imagine themselves as job applicants and to complete math and verbal tests that would be used for hiring decisions. They will be randomly assigned to one of three conditions (benevolent, hostile and no sexism). Before taking test, sexism will be manipulated by giving participants written instructions which are designed to measure effects of three conditions. Next, they will take performance test. Then, their self-esteem and level of gender-specific system justification endorsement will be measured. The study findings will be discussed in the lights of the Theories of Ambivalent Sexism and System Justification.
DO WOMEN CONTRIBUTE TO GENDER INEQUALITY? EXAMINING SELF-OBJECTIFICATION FROM THE SYSTEM JUSTIFICATION PERSPECTIVE

Yağmur Yağmurcu, Uludağ University, Bursa - Turkey
Leman Pınar Tosun, Uludağ University, Bursa – Turkey

Objectification Theory posits that in societies where female body is objectified, women internalize an objectifying observer perspective on their own body, and they suffer from negative consequences of this self-objectification (e.g.; increase in shame, anxiety and being preoccupied with body surveillance). The first aim of the present study is to investigate the consequences of self-objectification in a Turkish sample. The second aim is to explore one of the conditions under which women self-objectify. According to Ambivalent Sexism Theory, benevolent sexism may sometimes lead more negative consequences for women than hostile sexism. This study will test the hypothesis that self-objectification will be higher under exposure to benevolent sexism than under exposure to hostile sexism, or no sexism. Next, the study will search for a link between self-objectification and system justification. Data will be collected from 240 college students (120 female, 120 male). An experiment will be conducted in which sexism will be manipulated through reading some statements (some will be given the task of responding the statements; the rest will be asked to make proofreading). Gender-specific system justification, self-objectification and other study variables will be measured through psychometric scales. The results will be discussed in the lights of Objectification Theory, The Theory of Ambivalent Sexism and The System Justification Theory.

CONTENT VALIDITY EVIDENCE OF THE NEWLY DEVELOPED SOUTH AFRICAN SUBSTANCE USE CONTEXTUAL RISK INSTRUMENT

A17. General issues and basic processes - Research methods and psychometrics

Maria Florence, University of the Western Cape, Cape Town - South Africa  
Susara Koch, University of the Western Cape, Cape Town - South Africa  
Shazly Savahl, University of the Western Cape, Cape Town - South Africa  
Cassandra Wagenaar, University of the Western Cape, Cape Town - South Africa

The purpose of this presentation is to report content evidence gathered towards the validity argument for the South African Substance Use Contextual Risk Instrument in line with validity theory. This instrument was designed to measure contextual factors associated with adolescent substance use in low socio-economic status communities in South Africa. A mixed methods design was employed using focus groups and a specially designed questionnaire in order to evaluate the relevance and representation of the domains. Focus groups were used to inform the identification of domains for the instrument in line with the systems levels of the ecological theoretical framework. Different sectors of the relevant communities were interviewed in order to identify their perceptions of the factors that contribute to adolescent substance use. These domains were presented to selected community leaders for their consideration and comment. The study demonstrates that the micro-systems are the most important associated factors and that the family factors were the really key factors. The results of the quantitative analysis as well as the thematic analysis confirmed the relevance and representation of the factors selected for inclusion in the instrument. These findings demonstrate that the examination of content relevance and representation from the perspective of the target community can make valuable contributions to the content evidence for an instrument of this nature.
O1644
THE EFFECT OF THE SUPPORT PROGRAM FOR PEOPLE WITH MENTAL DISORDERS TO LIVE A MORE INDEPENDENT LIFE

E16. Health and clinical intervention - Other

Nikolaus Hausenbichl, University of Innsbruck, Innsbruck - Austria
Barbara Hildegard Juen, University of Innsbruck, Innsbruck - Austria
Silvia Blatter, University of Innsbruck, Innsbruck - Austria

The aim of the long-term study is to analyze the since 2011 ongoing interventions and the subsequent effect for people (N=5) with mental disorders in an outpatient assisted living context. The clients in this small care unit were recruited from our inpatient homeless-shelter. Our motivation is based on the fact that people with mental disorders are more affected by homelessness, and therefore we want to support them in order to live a more independent life. Our considerations are derived from the approaches of housing first and treatment first. We provide our clients a binding individual-focused care to improve a long-term mental stability and encourage them in the development of alternative assistance for mutual support, which is not entirely in conformity with the two approaches. So we created a special intervention program to make our service over a longer observation period measurable. This program includes items (e.g., household skills and individual crises) which are combined in an assessment sheet. The intervention is designed and conducted in a way that the clients are demanded as much as possible and as less as necessary in their everyday life. The caregivers are on site about two times per week, for about four hours - if needed more. The results confirm our hypothesis of effectiveness of the program and over our ongoing analysis we found that continuous abstinence from drugs, alcohol and the mutual support are important criteria to enhance more independent living.
O1645

RELIABILITY AND VALIDITY STUDIES OF TURKISH TRANSLATION OF SELF-AMBIVALENCE MEASURE

A03. General issues and basic processes - Psychometrics

Filiz Özekin-Üncüer, Middle East Technical University, Ankara - Turkey
Karanci Ayse Nuray, Middle East Technical University, Ankara - Turkey

The purpose of the current study was to evaluate the psychometric properties of Turkish version of the Self-Ambivalence Measure (SAM; Bhar & Kyrios, 2007), including an examination of its factor structure, reliability, and validity with associated measures of self, anxiety, and depression. The SAM consisting of 19 items assess moral ambivalence and self-worth ambivalence. During the adaptation process, translation and back-translation method (Brislin, Lonner, & Thorndike, 1973) was used. Subsequently, it was administered to 280 students from different departments of Middle East Technical University, Ankara, Turkey. Beck Depression Inventory, Beck Anxiety Inventory, Rosenberg Self-Esteem Scale, Eysenck Personality Questionnaire-Revised & Abbreviated, and Short-EMBU were administered to assess the questionnaire’s validity. Three weeks after the first administration, 50 of the participants were re-administered the SAM. The original factor structure, proposed by Bhar and Kyrios (2007), was evaluated with a confirmatory factor analysis. The Cronbach’s alpha coefficients for the self-worth ambivalence and moral ambivalence scales were found to be .80 and .85 respectively, and test-retest reliability of the scales was .77 and .55, respectively. This study showed that SAM is a reliable and valid tool that can be used in research and in clinical applications. The psychometric characteristics of Turkish version of Self-Ambivalence Measure will be discussed in the light of the relevant literature.
BULLYING IN COLLEGE STUDENTS: PREVALENCE AND ASSOCIATION WITH PERSONALITY AND EMOTIONAL INTELLIGENCE

Fany Eisenberg, Monterrey Institute of Technology and Higher Education, Monterrey - Mexico
José Cortés, Instituto Nacional de Psiquiatría Ramón de la Fuente, Mexico City - Mexico

The classroom is essentially a living space in which the most diverse interpersonal relationships are established, one of these are bullying, it is defined as "a form of aggressive, intentional and malicious behavior that is persistent, and whose duration ranges from a few weeks to sometimes months". At university level has not been studied phenomenon, nor are there references where harassment and bullying is related to personality and emotional intelligence of the actors. The purpose was to: 1) Determine the prevalence of aggressors, victims, victim-aggressor and no victims-no aggressors. 2) Determine the association of behaviors of bullying with the personality and emotional intelligence. 1067 college students. 523 men and 544 women were assessment with: CURMIC, for the evaluation of bullying; NEO-FFI for personality and PIEMO for emotional intelligence. The prevalence of bullying was associated with the type of harassment. Personality: the aggressors and the victims-aggressors were more neurotic and less agreeableness; the victims were less neurotic, more agreeableness and introverted. Emotional Intelligence: the aggressors and the victims-aggressors had less impulse control, self-esteem, social skills and they are less good persons; the victims were less optimistic and had less social skills and they are good persons. Bullying is a phenomena present in college level. This study claims for the control of bullying in college environments and the support of all the actors.
O1649
GRADUATE NURSES' DEFINITIONS OF WORK READINESS AND THE SKILLS THAT FACILITATE POSITIVE WORK EXPERIENCES

D13. Work and organization - Age and work

Arlene Walker, Deakin University, Geelong - Australia
Belinda Petersen, Deakin University, Geelong - Australia

Work readiness (WR) is a relatively new construct that can predict graduate potential. Recent research has found WR to be a multidimensional construct consisting of four dimensions: Work competence; social intelligence; organisational acumen and personal work characteristics. The current study aimed to determine whether graduate nurses’ definitions of WR and the WR skills that help or hinder early work experiences match existing dimensions of WR. One hundred and sixty three graduate nurses in their first year of work from 2 hospitals in Victoria, Australia completed a qualitative survey. The survey comprised short answer responses to critical incident technique (CIT) questions. The CIT is a method of identifying critical information about behaviour in specific situations. A two-step qualitative analysis was undertaken. Firstly, discourse analysis was used to assess the meaning in language used by participants in survey responses followed by a thematic analysis to identify categories and themes in relation to WR. Results found that all four existing dimensions of WR were represented in participants’ responses, however, the WR dimension of clinical competence was most frequently identified. This was in relation to both the language used by graduate nurses’ to define WR and their CIT descriptions about helping and hindering WR skills. Implications of the findings in relation to WR research are discussed.
WHEN ARE YOU GOING TO MARRY? INTENTION TO MARRY THROUGH THE LENS OF THEORY OF PLANNED BEHAVIOR AND SELF-REGULATORY FOCUS

C16. Culture and society – Other

Aylin Koçak, Hacettepe University, Ankara - Turkey
Athanasios Mouratidis, Hacettepe University, Ankara - Turkey

What makes people take important decisions in their lives, such as when they are going to marry? We relied on the Theory of Planned Behavior (TPB; Ajzen, 2002) to examine the degree to which people’s attitudes, subjective norms, and perceived behavioral control predict their intentions to marry. Furthermore, we used the Self-Regulatory Focus theory (SRF; Higgins, 2000) to examine whether such attitudes, norms, and perceived behavioral control could be partly explained by people’s focus on pursuing gains (promotion-focus) versus securing non-losses (prevention-focus) in their lives. In essence, we aimed to investigate whether the TPB along with SRF can better inform us about people’s intentions to act. To test our model, we conducted a web-based survey by recruiting a sample of 703 Turkish young adults (70.6% females; Mage = 24.84, SD = 4.35). The results from a structural equation model (S-Bχ2 [395; N = 703] = 809.14, p< .001, CFI = .934, SRMR = .054, RMSEA = .039 [90%-CI: .035 - .042]) showed that perceived behavioral control (PBC; β= .14) and positive attitudes towards marriage (β= .06) positively predicted intentions to marry. Furthermore, promotion-focus positively predicted PBC (β= .06) and subjective norms (β= .11), whereas assessment-focus negatively predicted PBC(β= -.09). These findings highlight the importance of jointly considering TPB and SRF to predict people’s intentions to act. The results are discussed in light of the two theories.

INTERROGATING THE “CRISIS” OF FATHERHOOD: ADOLESCENTS’ CONSTRUCTIONS OF FATHERHOOD IN LOW-INCOME SOUTH AFRICAN COMMUNITIES

C02. Culture and society - Family systems and processes

Debra Kaminer, University of Cape Town, Cape Town - South Africa

High levels of paternal non-residence (or absentee fathers) in both high and low income countries have been interpreted in the psychological literature as a ‘crisis’ of fatherhood, but little research has been conducted with children and adolescents to explore their perceptions of fatherhood. The current study examined adolescents’ discursive constructions of fatherhood within two low-income communities in South Africa. Photo voice methodology was employed to elicit visual representations of fatherhood from 35 male and female adolescents. Photo-elicitation interviews were then used to develop narratives about fatherhood, and a discourse analysis was conducted to identify the interpretive repertoires used by participants to develop versions of fatherhood. ‘Good fathering’ were constructed as simultaneously embodying traditional masculine roles such as material provision as well as the qualities of the ‘new’, emotionally involved father, setting up somewhat contradictory imperatives, while ‘bad’ fathering was attributed to poor moral character rather than to contextual or structural factors. While privileging nuclear families and biological fathers over single parenting and non-biological father figures, participants’ recognised an important collective role for ‘social fathers’ in their communities. Implications for future research on the ‘crisis’ of fatherhood, and for community-based interventions in contexts of high levels of paternal non-residence, are discussed.
ENGAGING YOUTH IN PEACE AND SAFETY ACTION THROUGH PHOTOVOICE: REFLECTIONS FROM A MULTI-COUNTRY AFRICAN PROJECT

Youth are often neglected as producers of knowledge and agents of change, yet they have the potential to make a valuable contribution to peace psychology. Drawing on a multi-country study aimed at exploring youth representations of peace and safety in marginalised communities in five African countries, this presentation discusses the use of Photovoice methodology for facilitating critical consciousness, promoting peace and safety among youth and stimulating social action among marginalised oppressed young Africans. Adolescent participants in five African countries were provided with cameras and basic photography training, and instructed to take photographs that represent peace and safety in their communities. Photoelicitation interviews were conducted to elicit narratives about the photographs, and the narratives were analysed using thematic analysis. Findings suggest that the material and discursive conditions that represent peace and safety for youth facing forms of marginality are multi-dimensional and complex. Further, the privileging of the knowledge and social lens of participants appeared to have catalysed varied forms of peace and safety activism amongst participants, albeit within a limited range and realm of influence. The study suggests that Photovoice may be a compelling methodological and intervention tool for promoting peace and safety in contexts of social oppression and inequity where youth are under-represented in processes of social transformation.
PARENT-CHILD RELATIONSHIP QUALITY AND MARITAL QUALITY: A 5-YEAR LONGITUDINAL AND DYADIC STUDY IN TAIWAN

This study examined spillover and crossover between parent-child relationship quality and marital quality in Taiwanese married couples over 5 years. For spillover, the link between parent-child relationship quality and marital quality would be examined. For crossover, the link between one person's marital quality and his/her spouse's parent-child relationship quality would be assessed. Although the spillover effect has been found consistently, the crossover effect is rarely studied. The sample for the current study was the 146 couples with preschool children. HLM models showed that parent-child relationship quality positively predicted marital quality and marital quality positively predicted parent-child relationship quality for both fathers and mothers. The coefficients representing these two links were significantly higher for fathers compared with mothers. However, a person's parent-child relationship quality was not related to his or her spouse's marital quality. In conclusion, the current findings showed spillover, rather than crossover, between parent-child and marital relationships in Taiwan. The spillover effect is stronger for fathers than for mothers. The findings underscore the mutual influences between parental and marital subsystems in the Chinese society. Taiwanese fathers tend to blend the boundary between the parent-child and marital dyads more easily than mothers do.
O1656
MATERIALISM AND MEANING OF MONEY (MOM): VALIDATION OF MONEY METAPHOR SCALE (MMS) IN NIGERIAN AND SOUTH AFRICAN CULTURES

C06. Culture and society - Attitudes and values

Obiajulu Anthony Ugochukwu Nnedum, Nnamdi Azikiwe University, Awka - Nigeria
Emmanuel Ezechukwu, Nnamdi Azikiwe University, Awka - Nigeria

Purpose – To examine the impact of material value (MV) on money metaphor scale (MMS). And to examine for between country differences on money metaphor scale among Nigerian and South African samples. This paper studied people’s attitude to, as well as their attitudinal meaning of, money (MOM). And the impact of materialistic value (MV) on the people’s attitudinal meanings of money in Nigeria and South African Cultures. The study was based on the conceptual and psychological foundations of the synthesis of Nigerian cultural money metaphors, and contemporary thoughts on money and individual differences in organizational behavior. Based on this foundations “meanings of money” to the people was conceptualized. Empirical part of the study had two phases; in the first phase, the instrument to measure “meanings of money” (MOM) that was developed in Nigeria and had been cross validated in Nigeria, Kenya and South Africa was further developed, revalidated and normalized with a sample of undergraduate (college) University students from Sovenga, South Africa and Awka, Nigeria. In the second phase the impact of materialism on the meanings of money was examined in line with the Egwu grand Generative Theory of Money (GTM) in a Nigeria sample as well as a South Africa sample, countries where multiculturalism, westernization, capitalism, and multi-ethnicity were a dominant feature of the Universities’ undergraduate population. Design/methodology/approach -- A validated questionnaire derived from previous empirical studies and the relevant literature was responded to by 261 students (South Africa, N=97 and Nigeria, N=164) t completed a materialism scale and the construct of money metaphor scale (MMS) in Nigeria and South Africa. Based on Previous Studies on the Construct validity of MMS in Nigerian culture, current results of exploratory factor analysis (EFA) as well as confirmatory factor analysis (CFA) suggest that the money metaphor measure is a multidimensional construct with four sub-constructs of importance/significance, freedom/security, poverty repulse obsession/neurotic ambivalence and achievement/recognition. Multiple regression analysis assessed the impact of materialism on four key constructs of meaning of money (importance/significance, freedom/security, poverty repulse obsession/neurotic ambivalence, and achievement/recognition). Findings — the materialism variable has a significant effect and predicts a good proportion of the variance in meaning of money underpinnings. Moreover, these underpinnings are significantly related to one another. Also, a 13 item Money Metaphor Scale (MMS) was further developed and revalidated on the basis of four of these factors. Multiple regression analysis of materialism construct unto the various money metaphor sub-constructs showed “achievement/recognition” and “freedom/security” to be the most powerful consequents. Reliability measures, as well as material value correlations were determined. Results were discussed with respect to how materialism (values construct) may predict meaning of money (an individual difference attitudinal variable) at the main scale level. A 1-way ANOVA compares yield insignificant between country differences on money metaphor scale scores. Research limitations/implications - The relationships investigated in this study deserve further empirical research. Apparently the data analyzed were collected from one sector of the academic organization in two countries, at one time period, more rigorous studies are required before general conclusions can be drawn. Practical implication -- One can systematically conclude, on the basis this evidence, that materialism can be moderated, mediated, initiated, reinvented, reinforced, and enacted by meanings of money attitudinal dispositions of individuals in society, encouraging the importance and significance of money, ensuring a strong feeling of freedom/security, inclination to poverty repulse obsession behavior, and building a cognitive thought that money is a sign of achievement and recognition leads to a psychological prophylaxis of individual’s money profile. Originality/value -- This study asserts that materialism is a very significant value which organizations can utilize in their quest for individual
money profile for greater selection, retention, and placement in a competitive environment over other competitors.
O1657
REGIONAL AND GENDER DIFFERENCES IN CAREER GOALS OF CHINESE HIGH SCHOOL STUDENTS—INTERESTS, PRESTIGE AND GENDER-TYPICALITY

B16. Development and education - Other

Lai Yin Sarah Wan, The Hong Kong Institute of Education, Hong Kong - Hong Kong
Fanny M. Cheung, The Chinese University of Hong Kong, Hong Kong - Hong Kong

This study examined the vocational interests, prestige and gender-typicality of career goals of three Chinese regional samples. 625, 750 and 747 high school students in Hong Kong (HK), Shanghai (SH) and Zhejiang (ZJ), respectively completed a questionnaire about their vocational interests and career goals. Results from SEM show support for Social Cognitive Career Theory (SCCT), where Holland’s vocational interests (Realistic, Investigative, Artistic, Social, Enterprising, & Conventional) predict the corresponding interest type of career goals. Significant regional and gender differences were found in interest types. Specifically, Social and Enterprising are the most common types for girls in HK and ZJ, while Investigative and Enterprising are the most common types for boys in the two groups. In the SH group, Investigative and Enterprising types are the most common for both boys and girls. Across all three samples, Realistic and Artistic types are the least common for girls and boys respectively. Besides, the prestige level of goals (rated by International Socioeconomic Index of Occupational Status) for SH and ZJ is higher than that for HK. Male students showed a higher level of gender-typicality in goals (rated by percentage of same-sex incumbents in the occupations) as compared to female students in all regions. Present findings support the applicability of SCCT to Chinese samples, and inform researchers and practitioners about the career development of Chinese students.
EMPERICAL RELATIONSHIP BETWEEN IMPORTANCE OF MONEY AND UNETHICAL BEHAVIOR OF WORKERS IN NIGERIA

Obiajulu Anthony Ugochukwu Nnedum, Nnamdi Azikiwe University, Awka - Nigeria
Emmanuel Ezechukwu, Nnamdi Azikiwe University, Awka - Nigeria

This study explored a model of importance of money and unethical behavior in Nigeria, by exploring the antecedents of the importance of money which may lead to unethical behavior in the workplace by using attitudinal framework. In a sample of 200 managers using the money ethic scale (Tang, 2000; Nnedum 2003), the study explored the relationship between money as an incentive (pay, pay raise or money or money instrumentality valence) or as an instrument of economic value as well as a material that evokes biological emotion (attitude to money). Seven main hypotheses were tested to evaluate the model and all of the hypotheses were supported. Results of multiple hierarchical regression analysis indicated that: (1) the direct path indicated that the importance of money had a significantly positive impact on unethical behavior; (2) the major indirect path revealed that corporate socialization influenced money instrumentality (pay) of workers that, in turn, strongly influenced money attitude that, in turn, was used to frame money importance. This exerted the strongest impact on money importance; (3) the subordinate direct path revealed that corporate socialization had a weak inverse impact on unethical behavior; while money instrumentality had an inverse impact on unethical behavior; whereas money attitude had weak inverse relationship with unethical behavior. A lesson for cognitive psychologist, cognitive neuroscientist, social and clinical psychologist is that, of all tested possible predictors, money importance (i.e., a human cognitive factor) was mostly implicated in the unethical behavior model. It establishes novel information generation in cognitive-neuroscience that human dysfunctional socialization in organization evince monetary thought obsession of importance that valourizes unethical behavior in the workplace. The empirical discussion of the focal model was grounded in the substantive theory of reasoned action framework (Ajzen & Fishbein, 1980). KEYWORD: Corporate Socialization, Importance of Money, Money Attitude, Money Instrumentally, Unethical Behavior, Cognitive Psychology, Cognitive-Neuroscience, Vocational and Clinical Psychology.
The purpose of the present study was to investigate how self-esteem, emotional competence and perceived peer pressure were related to different bystander behaviors in bullying situations. Therefore, this study examined pathways that linked perceived peer pressure, self-esteem, and emotional competence to different bystander behaviors in bullying situations. Nine hundred and thirty-two Japanese high school students (mean age-16.6 years, SD=1 year; 400 boys and 532 girls) participated in the study. Bystander behaviors were assessed using self-report questionnaire measures of passive and defending bystander behavior in bullying. Results showed that compared with girls, boys expressed higher self-esteem and more passive bystander behaviors in bullying. Self-reported passive behavior was positively associated with perceived peer pressure, and only for girls, was negatively related to self-esteem and emotional competence. And self-reported defending behavior was positively associated with self-esteem for both girls and boys. Moreover, the findings of a series of hierarchical regressions indicated that only for girls, emotional competence might buffer the negative influence of perceived peer pressure upon the passive bystander behaviors, and that only for boys, the higher self-esteem they would have, the more supportive actions they might take. Implications of these findings are discussed.
O1661
CONTRIBUTIONS OF CUSTOMER CO-CREATION TO COMPETITIVE ADVANTAGE OF BANKING INDUSTRY IN NIGERIA

F03. EXPO 2015 Hot Topics - Consumer behaviour

Obiajulu Anthony Ugochukwu Nnedum, Nnamdi Azikiwe University, Awka – Nigeria
Emmanuel Ezechukwu, Nnamdi Azikiwe University, Awka – Nigeria

Purpose: To examine the impact of customer co-creation or relationship marketing strategy on competitive advantage. Design/methodology/approach: A validated questionnaire derived from previous empirical studies and the relevant literature was completed by 100 bank customers in Nigeria. Multiple regression analysis assessed the impact of relationship marketing strategy on five key constructs of competitive advantage (total customer satisfaction, customer retention, customer loyalty, relationship benefits, collaboration and empowerment). Findings: The relationship marketing strategy variable has a significant effect and predict a good proportion of the variance in competitive advantage underpinnings. Moreover, these underpinnings are significantly related to one another. Research limitations/implications: The relationships investigated in this study deserve further empirical research. Apparently the data analyzed were collected from one sector of the service industry in one country, at one time period, more rigorous studies are required before general conclusions can be drawn. Practical implication: One can systematically conclude, on this evidence, that competitive advantage can be initiated, reinvented, reinforced, retained and enacted by marketing strategies aimed at implementing total customer satisfaction, encouraging customer retention, building customer loyalty, ensuring relationship benefits, demonstrating collaboration and empowerment. Originality/value: This study asserts that relationship marketing is a very significant tool which banks can utilize in their quest for greater competitive advantage over competitors. Keywords: Customer co-creation, Relationship marketing, competitive advantage, Banks, Nigeria.
EXPERO4CARE: A MODEL TO ASSES THE QUALITY OF THE LEARNING OUTCOME IN THE HEALTHCARE SECTOR

Learning plays a strategic role in the organizational development, increased by the need to update continuously the professional competences in a changing context. A huge amount of resources are invested in life long learning, and it becomes important the evaluation of the learning outcome (LO) in order to highlight the added value and the impact of learning. To achieve this aim, a quality model – named Expero4care - has been developed and tested in 3 universities and 3 healthcare organizations, supported by EU funds (TOI LLP 2013). The concept of quality is rooted on a multi stakeholders approach. All the stakeholders are included in the evaluation process by means of six indicators, useful to monitor the training effectiveness: Competencies (referred to the acquired competencies using the KSAV model: Knowledge, Skills, Attitudes and Values), Transferability, Applicability, Participation, and Credits. In order to evaluate the quality of LO, the following dimensions have been assessed: Quality of Results, Training Processes, Quality of Competencies, Satisfaction with Results, Training culture. Data had been collected through questionnaires and interviews, in two phases: expectations ('should' area, tested before the course beginning) and perceptions ('is' area, tested after the course end). The collected data have been elaborated to highlight strengths and weakness points, in order to focus the attention on improvement’s actions.

DOES AMOTIVATION MATTER MORE THAN MOTIVATION IN PREDICTING MATHEMATICS LEARNING GAINS? A LONGITUDINAL STUDY

A11. General issues and basic processes - Motivation and emotion

Nadia Leroy, University of Cergy-Pontoise, Cergy Pontoise – France

This study examined the change trajectories of different types of motivational regulations proposed by self-determination theory and their relationship with achievement during the first year of junior high school. First, multilevel growth models described the change trajectories of motivational regulations in 1082 students. On average, all kinds of motivation regulations, whether self-determined or nonself-determined, decline throughout the school year. The change pattern of amotivation, on the other hand, presented a continuous increase throughout the investigated period. Second, the growth parameters of these trajectories were extracted and used as covariates in explaining learning at the end of the school year. Two main results can be drawn from this study. First of all it reveals that, not only does the mean level of the motivational constructs at the beginning of the school year significantly contribute to explain the variance in maths learning, but also does their rate of change during the school year. Secondly it shows that when all motivational constructs (i.e. all motivational regulations and amotivation) are considered jointly in the same model, only does amotivation affects mathematics performance at the end of the school year. Theoretical implication of the finding with regard to amotivation are discussed.

SOURCES OF SELF-EFFICACY: THEIR DEVELOPMENT AND IMPACT ON PRIMARY SCHOOL STUDENTS

B06. Development and education - Emotion and self

Gwénaëlle Joët, Université Pierre-Mendès-France, Grenoble - France
Pascal Bressoux, Université Pierre-Mendès-France, Grenoble - France

For the past 30 years, self-efficacy has captured the attention of researchers, especially in the educational sphere. High self-efficacy fosters students’ academic achievement by leading them to persevere longer, search for deeper meaning across learning tasks, and experience less anxiety. Students’ self-efficacy has been shown to predict achievement outcomes in diverse areas, such as mathematics and French. According to Bandura, self-efficacy is based on how students interpret information from four main sources. Mastery experience comes from interpretations of one’s own performance. Students interpret the actions of others through vicarious experience. Social persuasions and evaluative feedback from parents and teachers can alter students’ confidence. Lastly, students interpret their physiological and emotional states, such as stress and anxiety, as indicators of their capabilities. The aim of this work is twofold: we sought to assess how these four sources change as students progress from Grade 3 to Grade 4 and to investigate how these sources and their change over time might influence students’ self-efficacy in mathematics and French. We will also examine whether the growth trajectory for the four sources varies from one discipline to another, and whether the influence of the sources on self-efficacy is similar across disciplines. This study will offer ways in which teachers and parents might improve students’ self-efficacy by promoting the sources that are most influential.
O1667

COMMITMENT THEORY AND BEHAVIOR CHANGE: APPLICATION TO THE USE OF SUSTAINABLE TRANSPORT MODES

F21. EXPO 2015 Hot Topics - Environment and sustainability

Alexandra Gheorghiu, Université de Picardie Jules Verne, Amiens - France
Sophie Chatain, Université de Picardie Jules Verne, Amiens – France
Davy Castel, Université de Picardie Jules Verne, Amiens – France

To reduce climate change, strategies designed for promoting sustainable transport modes become a key-point of public actions. The latters are moving from an approach based exclusively on objective determinants of transport use (available facilities, etc.) towards the integration of psychological determinants involved in behavior change. Research in social psychology, especially research based on commitment theory, provides considerable insights for this purpose. However, this stream of research relies almost exclusively on experimental design. As a consequence, the ecological validity of its findings is an important concern. In Picardie, a French region situated in the north of Paris, public authorities decided to initiate actions devoted to change individual behavior regarding transport use based on commitment theory and implicit foot-in-the-door technique: as a commitment act, people were proposed to take public transport instead of their individual car during a significant period of time. This study evaluated the impact of these actions on attitude and behavior change. Participants’ attitudes toward public transport were measured before and after the commitment act and the durability of behavior change was assessed. First results will be presented at ECP 2015 Congress. This research received a grant from the French Environmental Agency and the Picardy Regional Council.
O1668
INVESTIGATION OF THEORY OF MIND IN SCHIZOPHRENIA BASED ON POSITIVE AND NEGATIVE SYMPTOMS, TYPE OF DELUSIONS AND GENDER

E16. Health and clinical intervention - Other

Mojtaba Kazemian, Ibn-e-Sina Hospital, Mashhad University of Medical Sciences, Mashhad - Iran
Mohammad Reza Fayyazi Bordbar, Ibn-e-Sina Hospital, Mashhad University of Medical Sciences, Mashhad - Iran
Mehdi Baniasadi, Ibn-e-Sina Hospital, Mashhad University of Medical Sciences, Mashhad - Iran
Golkoo Hosseini, Ibn-e-Sina Hospital, Mashhad University of Medical Sciences, Mashhad - Iran

Objectives: Deficit in the ability to understand others' mental conditions, opinions, beliefs and desires have been reported among schizophrenic patients. However, fewer studies have examined the type of positive/negative symptoms and delusions on their social cognition abilities. The main purpose of this study was to investigate the theory of mind (ToM) performance in schizophrenic patients and compare it with healthy controls. Methods: This cross-sectional study conducted at Ibn-e-Sina psychiatric hospital in Mashhad, included 28 schizophrenic patients, aged between 18 and 50, based on DSM-IV-TR criteria and 14 healthy subjects. Evaluation of symptoms was performed by positive and negative syndrome scale (PANSS) test and the ToM assessed by the “Reading the Mind in the Eyes” Test. Results: Analysis of variance showed a significant impaired ToM in schizophrenic patients as compared with the healthy controls (p=0.00). But the ToM deficits did not differ in positive and negative symptoms (p=0.951), genders (p=0.286) and the frequency of episodes (p= 0.470). The delusions of persecution and grandeur showed a significant lower ToM performance as compared with the delusions of control (p=0.041). Conclusion: Although the ToM abilities impairment in schizophrenia has been proved, its relationship with types of symptoms and delusions, and the duration of illness require further investigations. This may help to improve the possible treatments and prevention potentials in future.
O1669
PARENTAL EMOTION SOCIALIZATION AND ITS RELATIONS WITH EMOTION REGULATION, SOCIAL DEVELOPMENT AND CREATIVITY

B10. Development and education – Parenting
Bilgesu Hasçuhadar, Abant Izzet Baysal University, Bolu - Turkey
Hamit Coşkun, Abant Izzet Baysal University, Bolu – Turkey

Aim: In this research, the relations among the parental emotion socialization, child’s social competence, creativity and the mediational role of child’s emotion regulation in this relationship will be investigated.
Introduction: Emotion socialization is defined as the parent’s responses and communication with their children when the children experience negative emotions. The parental emotion socialization have some influences on child’s emotion regulation and social competence. Also, child-parent interaction has also some impacts on child’s creativity.
Method: The sample of study will include a total of 200 pre-school children whose ages are 5-6 years old, their mothers, and teachers. The children’s emotion regulation skills will be measured via the task of delaying gratification and creativity will be measured via the task of finding different dispositions of an object. Emotion socialization and parenting behaviors and social competence will be assessed by a means of scales.
Expected Results: This planned study will demonstrate whether or not the relationship between parental emotion socialization and child rearing behaviors will be present in terms of different aspects of the child development and investigate whether or not child’s emotion regulation is a mediator variable in this relationship.
Conclusion: The plausible results from the findings will contribute to the quality of parent-child relationship and intervention programs for child development.
O1670
FROM CLINICAL TO POSITIVE PSYCHOLOGY: UNDERSTANDING AND MEASURING PATIENTS’ STRENGTHS

E09. Health and clinical intervention - Positivity and well-being

Tanja Bellier-Teichmann, University of Lausanne, Lausanne – Switzerland
Valentino Pomini, University of Lausanne, Lausanne – Switzerland

Introduction: Empirical evidence suggests that concentrating on strengths serves a preventative function against psychopathology. However, standardized tools assessing strengths of patients suffering from mental disorders are rare and often limited to research purposes. These instruments generally measure one specific feature; they rarely give a global profile of patients’ strengths. This study aimed to develop a new instrument, which identifies a patients’ strengths profile. Method: Our tool measures 31 strengths classified in three dimensions according to Seligman’s model of well-being. In order to be adjusted for patients with cognitive or language impairments, this instrument is based on a Q-Sort method with figurative items. We led a feasibility pilot study in a sample of 21 psychiatric patients. Results: Preliminary results showed that this tool can easily be administered and is well appreciated. The most present strength was professional healthcare. The majority of strengths were considered as moderately to very important for personal well-being. The more frequently cited strengths patients want to develop were self-esteem, travelling and work. Conclusion: Assessing strengths helps defining clinical interventions promoting recovery and well-being. Our first results with this new instrument are promising. Further steps will involve a validation study on a larger sample of psychiatric patients and the measurement of the impact of patients identifying their personal strengths.
O1673
WORKERS’ OBJECTIFICATION: CURRENT STUDIES AND FUTURE DIRECTIONS

C16. Culture and society – Other

Cristina Baldissarri, University of Milan-Bicocca, Milan - Italy
Luca Andrighetto, University of Genua, Genua – Italy
Chiara Volpato, University of Milan-Bicocca, Milan – Italy

This contribution aims to present the new field of research on workers’ objectification. Starting from several theoretical assumptions (e.g. Arendt, 1958; Marx, 1844; Nussbaum, 1995) we provide a review of first empirical evidence of objectification within working domain that analysed, consistently with the psychosocial literature, the two facets of this phenomenon. The first concerns the other-objectification, the process by which workers are objectified by others as a consequence of their work. Three studies show that factory worker, unlike artisan, is perceived more as an instrument than a human being and as a mindless entity when participants focus on its manual activities rather than on its person. Further, the key aspects of factory work (i.e., repetitiveness, fragmentation and dependence on the machine) each have a significant impact on objectifying perceptions. The second facet regards the workers’ self-objectification. Building on previous literature on this field, we found that the perception of being treated as an instrument by one’s own superior is positively related with workers’ tendency to objectify themselves (i.e., to perceive themselves as lacking human mental states). Further, exhaustion and cynicism emerge as the psychological mechanisms underlying the relationship between other- and self-objectification. These first findings and future directions are discussed in terms of their theoretical and practical implications for the current work situation.
Life trajectories of adolescents are highly influenced by their school achievement. Mathematics has been envisaged as a "critical filter" for access to scientific and technological careers. Identifying the educational and psychosocial factors that have an effect in math success has been considered as an important area of study. Mathematics self-efficacy, as the past research has reliably shown, is a powerful predictor of math achievement and, consequently, of math-related major choice and careers. In this study we examine the psychometric properties, via the Rasch model, of a new math self-efficacy scale (Math Self-efficacy Scale-General Themes, MSS-GT) that was designed to access the perceived capabilities of Portuguese high school students to successfully manage and learn the major components of their math curriculum. A non-probabilistic sample of 113 of 10th grade students, of both genders (53.1% girls), with a mean age of 15.2 years (SD = .68), answered a survey including several scales and a socio-demographic data form. Using the Rasch RSM, the new MSS-GT revealed adequate psychometric properties, enabling to assess with high precision both persons and items. Validity estimates were acceptable and MSS-GT total score explained a moderate amount of variance of math grades even after controlling math anxiety. The MSS-GT is an inexpensive, quick, reliable and valid device that can be used for research and educational assessment in school contexts.
MODERATING ROLE OF COLLECTIVISM ON VICARIOUS JUSTICE EFFECTS ON EMOTIONS AND ATTITUDES

This study examines the moderating influence of collectivism on the direct relationship between vicarious justice and positive emotions, trust and affective commitment and inverse relationship between vicarious justice and negative emotions. Vicarious justice judgments are important for varied reasons— they influence victim’s reaction to injustice, organizational members learn vicariously about the treatment to expect from the organization, can influence resource allocation towards the organization and explain how unethical behavior evolves and spreads. Collectivist values give predominance to group goals, cooperation and commitment to the organization because of ties with managers, owners and co-workers, thereby, act as a moderator on vicarious justice effects. An experimental study was conducted across 165 undergraduate students, with vicarious justice perceptions manipulated using role playing vignettes. Hierarchical regression modeling was done to test the moderating effects of collectivism on the relationship of vicarious justice with trust, emotions and affective commitment. The findings show vicarious justice significantly effects trust, positive and negative emotions and affective commitment, but collectivistic values do not have any significant moderating effect. Possible explanation could be that collectivist value orientations, as described in literature may not matter in reactions to vicarious justice. Hence, examining other value orientations like femininity, power distance and cross-cultural studies would aid in getting a more complete understanding.
In modern changing world a people’s mobility increases, demands to readiness to life situation changes increase. The task of our research is a study of psychological factors of readiness to change life situations. The object of study are the real life situations experienced by people. The research is based on a comparison of psychological characteristics of decision-makers in favor of changing situations or save it unchanged. Participants in the study: (1) 89 middle managers of large companies, accepted or refused an offer and career opportunities associated with a residence changing. Two groups have been allocated: a group of people who refused to change situations, and those who have found varying degrees of readiness to change it. (2) 302 first-year students choosing between studying in their hometown’s university and university located into another city. 110 people decided to choose a more prestigious university that requires moving to another city, and 192 people have refused to change location. Personality traits, biographical information, attitudes and values have been studied. It was found that psychological characteristics of person, his/her behavioral skills (that can act as resources in a situation of changes), are less important than his/her value orientations. These value orientations reflecting a man's relationship with an environment play a crucial role in his/her readiness to change life situation.
This work describes an integrated and multidisciplinary intervention for patients suffering of chronic pain who have difficulties in the adherence and management of pharmacological and surgical treatments in addition to a higher likelihood for relapse. The main aims of the psychological intervention are to prevent distress and the experience of “double damages” (organic and psychic pain) to reduce pain-related disability, and to provide the skills to manage pain improving pain-coping strategies. Another aim is to give indications to treat early psychiatric co-morbidity and risk of addiction. The intervention consists in psychodiagnostic assessment, individual and group treatments. The assessment concerns anxious and depressive symptomatology (BDI-II, STAI), perception of pain (QUID), personality profile (MCMI-III), coping strategy and quality of life (COPE-NVI SF-36), effective self-regulation and outcome-evaluation, (CORE-OM, DERS, GSES). Group treatment is structured in 10 psychoeducational sessions (4 < 8 patients) focused on the description of behaviors, emotional aspects and experiences related to pain and of their impact on general well-being and self-efficacy. The retest is scheduled at the end of treatment. Attended results are the perception of more self-efficacy and the increase of self-functioning’s awareness.
O1680
DISCREPANCIES BETWEEN ADOLESCENT’S AND PARENTS PERCEPTIONS OF PARENTING PREDICT ADOLESCENT ALCOHOL USE

B10. Development and education – Parenting

Aart N. Mudde, Open University of the Netherlands, Heerlen – Netherlands
Betteke Coelingh Bennink-Krantz, Open University of the Netherlands, Heerlen - Netherlands

Background: Although relations between parenting style and adolescent alcohol use have been confirmed in numerous studies, possible discrepancies between adolescents’ and parents reports of parenting have only been studied with respect to elementary school pupils’ problem behavior and adolescents’ peer relationships. Present study investigated whether the direction of the discrepancy between adolescent’s and parents perceptions of parenting are related with adolescent alcohol use. Method: Among 2991 Dutch adolescents (mean age 13,7) and one of their parents a questionnaire measured perceived support, control and alcohol related rules and alcohol use. Results: The less adolescents reported perceived support and rules compared to their parent, the more alcohol they consumed. These relations were stronger for boys and older adolescents. Discussion: Results seem to be in line with earlier studies in different populations concerning other behaviors. Discrepancies between adolescent’s and parents perceptions of parenting may be indicative for misbalanced families in which more problems can be expected.
THE IMPACT OF TEACHING METHOD ON EPISTEMOLOGICAL BELIEFS AND CLASS ACTIVITIES OF ELEMENTARY SCIENCE STUDENTS

B03. Development and education - Learning and instruction

Zaynab Sabetirad, University of Mazandaran, Babolsar – Iran
Soheila Hashemi Koochaksaraei, University of Mazandaran, Babolsar - Iran

Epistemological beliefs are assumptions and beliefs that people have about knowing and knowledge. Education setting is essential factor in epistemological beliefs development. By using various teaching methods, teachers may create specific epistemic climate. In this research based on quasi-experimental design fifth grade students at two science classes were compared. In one school two classes were homogenized based on students IQ and academic achievement. Experimental group received problem-based learning whereas in control group regular teaching method which emphasized on simple grouping of students for accomplishing class tasks was used. The study was conducted during a four-week unit about environment pollution, which was the first of the four science units studied in the fifth grade. Epistemological beliefs were measured along four dimensions (Source, Certainty, Development and Justification) with a 26-item questionnaire which was developed by Elder. In addition, the quality of students’ worksheets were analyzed and compared. Findings indicated there was no significant difference ($t= 1/131$, sig=$0/263$) between two groups in epistemological beliefs. But regarding the quality of worksheets, experimental group performance in organization, completion of required section, neatness… was higher than students in control group. It is concluded, to change epistemological beliefs spending more time than 4 weeks is necessary; because it is a developmental variable. But higher performance of experimental group students in activity sheets may be related to PBL essence. It seems applying PBL in class brings about more motivation and purposeful cooperation among students.

LEARNING FROM MISTAKES, OR NOT. TEACHERS’ ERROR ORIENTATION AND MISTAKE-HANDLING STRATEGIES

B03. Development and education - Learning and instruction

Martina Corazza, Alma Mater Studiorum - University of Bologna, Bologna – Italy
Maria Cristina Matteucci, Alma Mater Studiorum - University of Bologna, Bologna - Italy
Rossella Santagata, University of California Irvine, Irvine - United States

This study investigates teachers’ beliefs about errors role in learning and the relevant strategies used in classroom to handle them. Literature concerning this topic includes several works on the analysis of teachers’ mistake-handling strategies, but only a few studies explore teachers’ error beliefs and the relationships with practices. In the present work, firstly teachers’ beliefs have been analysed through an adaptation of the Error Orientation Questionnaire filled in by 60 high-school teachers and secondly 3 math teachers’ classes have been videotaped and mistake-handling strategies were coded. Cluster analysis of this data revealed groupings which were based on 2 opposite error orientations (positive vs negative) and the analysis of the videotaped lessons suggested the higher effectiveness of the positive attitude on students’ learning. In fact, teachers with positive error orientation used more adaptive strategies and had higher levels of mastery achievement goal, self-efficacy, and mastery learning practices. Although this group of teachers shown better practices, they still perceived high strain in front of errors. This result demonstrates that error meaning still maintains ambiguity. Even if further validations of the scale are needed, interesting practical implications are suggested by this study, like new topics for teachers’ training (e.g. teachers’ worries about mistakes’ onset; new instructional strategies that emphasize error learning potential).
O1692
THE “WRONG” TIME TO DO WHAT IS ‘RIGHT’: EVALUATIONS OF CONFRONTATIONS OF PREJUDICE DIRECTED TO OUTGROUPS

C08. Culture and society - Prejudice and social exclusion

Susana Lavado, University of Lisbon, Lisbon - Portugal
Cicero Pereira, University of Lisbon, Lisbon - Portugal
Jorge Vala, University of Lisbon, Lisbon - Portugal
John Dovidio, Yale University, New Haven - United States

Across three studies, we aimed to investigate how people respond to a person who, under conditions of high or low personal cost, confronts or does not confront a racist remark about another group. Results show participants approve a confrontation more than a non-confrontation of prejudice when the costs of confronting are low, but not when the costs of confronting are high (study 1). Furthermore, study 2 results this relation is mediated by how participants imagine the person who confronts (vs. does not confront) would feel. We argue this happens because the personal costs of confronting are perceived as an unprejudiced reason for not confronting prejudiced targeting an outgroup. Therefore, failing to confront when the costs are high does not threaten a person’s social and personal image as someone egalitarian, as suggested by Aversive Racism Theory (Gaertner & Dovidio, 1986; 2005). Accordingly, study 3 results show that when the personal costs of confronting are high, participant’s scores on Schwartz’s Universalism value (Schwartz et al., 2012) moderate the difference between the evaluations of confrontation (vs. non-confrontation). Our findings show that people do not always approve confrontations of prejudice directed to outgroups, suggesting that under some conditions racism may be tolerated in egalitarian societies.
O1693
TRUTH-TELLING EVALUATIONS OF TURKISH PRESCHOOL CHILDREN: THE ROLE OF INDIVIDUAL VS. COLLECTIVE BENEFITS

B05. Development and education - Moral development and prosocial behaviour

Hatice Işık, Middle East Technical University, Ankara - Turkey
Buse Gönül, Middle East Technical University, Ankara - Turkey
Basak Sahin-Acar, Middle East Technical University, Ankara - Turkey

Cultural context is highly influential on children’s moral judgments from very early ages. By considering the effect of cultural context, this study aimed to assess Turkish preschool children’s evaluations of truth telling behaviors regarding the benefit individual or collective. As a preliminary assessment, 75 children were (Mage=55.82 months, SD=5.76) interviewed in their pre-schools. Two hypothetical vignettes regarding a child telling the truth in favor of the individual but at the expense of collective benefit, and vice versa were told by using finger puppets. Children were asked to evaluate whether what the character did in the vignettes were true or not. Results showed that children significantly approved telling the truth for the sake of collective, t(74)=-9.13, p<.001; however, they did not differ in their evaluations where there was an individual benefit not the collective. When their evaluations of were examined between two conditions, children approved telling the truth for the collective benefit significantly more frequently compared to telling the truth for the individual benefit, t(74)=5.33,p<.001. Complementarily, they disapproved telling the truth for the benefit of individual more frequently compared to telling the truth for the benefit of collective, t(74)=-3.84,p<.001. By considering the relatedness orientation of the Turkish cultural context, preschool children showed their awareness when considering individual and collective values simultaneously.
O1694
STUDENTS’ AFFECTIVE VALUE OF PERSONAL RESOURCES, ENVIRONMENT & ORGANIZING ACTIVITIES IN THE EARLY STAGES OF BUSINESS STARTUP

D02. Work and organization - Leadership and entrepreneurship

Leonidas Zampetakis, Technical University of Crete, Chania - Greece
Manolis Lerakis, Technical University of Crete, Chania – Greece
Konstantinos Kafetsios, University of Crete, Rethymnon – Greece
Vassilis Moustakis, Technical University of Crete, Chania – Greece

Affect plays an important role in the construction of preferences yet the influence of affect in entrepreneurship research is scarce. We present the results of a research project that focuses on affective value and set out to develop an integrative model for understanding entrepreneurial behavior at the early stages of new business creation. Our approach considers business startup as a process that simultaneously combines five factors from individual’s personal resources (namely: knowledge for business startup and financial position), micro-social environment (namely: family environment) and organizing activities (namely: planning and resource acquisition). We included the affective valence of the abovementioned factors within an overall decision situation and assessed their relative value in relation to the intent to start a new business. Results from a conjoint study with students (N=268) evaluating prospectively the affective value of the factors, suggests that students’ higher entrepreneurial intent is associated with a more positive affect from their “knowledge for business startup”, their “financial position”, their abilities in “resource acquisition” and in “business planning” and finally their “family environment”. Our results are in line with the notion of utility maximization that has been applied to explain the decisions to engage in entrepreneurship and with recent research proposing that happiness and well-being are important drivers of entrepreneurship.
THE EFFECTS OF CHILDREN’S SOCIAL EXCLUSION/INCLUSION DECISIONS ON THEIR JUSTIFICATIONS

B07. Development and education - Social cognition, identity and social interactions

Basak Sahin-Acar, Middle East Technical University, Ankara - Turkey
Buse Gönül, Middle East Technical University, Ankara - Turkey

As an important feature of the group formation process during the socialization, children use various information sources when they decide on whom to exclude or whom to include from their peer groups. With this understanding, we aimed to examine the effects social exclusion decisions of children on their related justifications in the themes of gender, disadvantaged groups and aggressiveness. In total, 150 children (Mage=11.5 years, SD=2.24) participated in their schools. We presented children three vignettes including two candidates who both want to be a part of a peer activity with equal qualifications separately for each theme. Between those two candidates, while one of them fits the stereotype of the group activity, the other candidate does not fit in. Children were asked to choose between two characters in the stories given to them and also for their justifications behind their decisions. Justifications were coded according to the schema used by Killen and Stangor (2001). In all of the three conditions, children who chose the stereotypical child in the stories justified their decisions by using morality domain, whereas children who chose the non-stereotypical child justified their decisions by using socio-conventional domain. Complementary findings in all of the themes showed that children have a well-established understanding in group stereotypes and conceptualize their judgments on the basis of their acquired social codes.
O1696
THE ROLE OF AUTHENTIC LEADERSHIP FOR EMPLOYEE VOICE AND TASK PERFORMANCE: ANALYSIS OF MEDIATORS AND MODERATORS

D02. Work and organization - Leadership and entrepreneurship

Johannes Rank, Technical University of Berlin, Berlin – Germany
Anika Badock, University of Konstanz, Konstanz - Germany

Despite the increasing scientific and practical interest in authentic leadership, little research has investigated relationships between this leadership style and different factors of employee performance. Therefore, the purpose of this study was to assess associations between authentic leadership and subordinates’ task performance as well as voice behavior (i.e., change-oriented communication) and to examine mediators and moderators of these relationships. On the basis of several theoretical models, we developed hypotheses concerning main, mediation and moderation effects. Field survey data were collected from 169 supervisor-subordinate dyads employed in one technology-oriented company in Germany. Using established scales with satisfactory reliabilities, supervisors rated their subordinates’ task performance and voice behavior, whereas subordinates rated their supervisors’ authentic leadership and their own proactive and authentic personality. Authentic leadership was positively and significantly associated with task performance and voice behavior. As hypothesized, affect-based trust mediated the relationship between authentic leadership and voice behavior. Finally, authentic leadership was less positively associated with task performance among subordinates high in authentic personality. These findings contribute to knowledge of the processes through which and the circumstances under which authentic leadership enhances prescribed and proactive forms of employee performance.
A systemic perspective invites us to compare emigration to a process of uprooting implying that we all have roots in a particular social and cultural context. When the act of emigration takes place an ecological gap or hole is consequently left behind which requires a process of re-defining, re-growth and re-distribution to take place. This ecologic analogy of the social world, emphasizes the fact that different systems are rooted in reciprocal relationships. These human systems are connected in the form of social communities and these are deeply affected by emigration, where pivotal relationships are torn apart. Therefore the very act of emigration impacts not only on those leaving but also on those left behind, seriously disrupting a number of social networks with multifold ramifications. In this paper I will use the example of South African emigration to illustrate the fact that emigration is never an isolated individual event but rather a systemic phenomenon, which impacts on a number of multiple systems. This qualitative study explored the impact of South African emigration on family life and social networks in an attempt to provide a systemic perspective on what is often viewed as an individual event driven by socio-economic factors. The South African study focusing on the experiences of both those emigrating and those staying behind clearly illustrates the systemic interconnectedness of the emigration process. Furthermore I will also discuss how an ecological perspective of emigration may provide a useful framework for psychologists working with emigrant families.
The Psychology Board of Australia regulates psychology in Australia in the public interest. Twenty-five years ago a national examination was identified as a needed way to validate entry to the profession and to assist in the assessment of international applicants. Over the past six years the Psychology Board of Australia through a national examination committee have developed and implemented a national examination for those seeking to become registered and be able to practice independently. The national examination is a test of applied psychology - specifically the application of ethical reasoning, use of tests and assessments, application of interventions both at an individual and organisational level, and skills in communication. The test uses a case study format - meaning that candidates must read and reflect upon common problems encountered by the practicing psychologist and choose the best response to this case. The structure is to use computer-assisted testing using a multiple-choice format supported by strong psychometrics and security protocols. This presentation will provide an overview of the test development, structure and present validity data from the first analyses of candidates sitting in confidential test centres across Australia. Results indicate that the examination is supporting a competence-based regulation system and assisting in identifying those who are ready to move to independent practice across a wide range of psychological workplaces.
Chinese environmental values (CEVs) are part of Chinese cultural values, which have crucial impact on environmental decision making and behaviours. This study explored the effects of CEVs on water resource dilemmas (WRDs). WRDs are often characterized by uncertainty and strongly delay. These characteristics can lead to probability and temporal distances. According to construal level theory, psychological distances moderate the relationship between CEVs and WRDs. High construal level variable such as CEVs exert more influence on high construal level dependent variables when psychological distance is farther, while less influence on low level ones. In WRDs such as waste water discharge and water utilization problems, who are involved is a low construal level variable and the amount of water is a high level one. The results of study 1 revealed that CEVs had negative effect on the amount of waste water discharge and positive effect on self-others difference rate; when psychological distance was farther, negative effect on the former was larger while positive effect on the latter vanished. The results of study 2 showed that CEVs had negative impact on the quantity of water taken and positive impact on self-others difference rate; when psychological distance was farther, negative impact on the former was larger while positive impact on the latter disappeared. These findings expanded environmental social dilemma researches and enriched cultural value studies.

THE MIND ONLINE: TRAUMATIC REPRESENTATIONS THROUGH SOCIAL MEDIA

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Yianna Ioannou, University of Nicosia, Nicosia - Cyprus

This paper examines the psychological implications of having instant and wide access to personal and collective traumatic events through social media sites. More specifically, it explores, from a psychoanalytic perspective, the ways in which such sites are being used to represent traumatic experience, in an effort to work through and make sense of inconceivable realities. In the aftermath of personal and collective tragedies, social media profiles of victims and perpetrators alike tend to be utilized as primary sources of information, as memorials, as symbolic burial sites, as virtual courts of justice, etc. Online profiles are perceived as entryways into the minds of the individuals they represent, almost equating virtual reality with conventional reality, and treating the profile as a representation of the actual person. These virtual spaces become at once deeply private and utterly public, holding the tension between inside and outside in ways that shape the experience of the traumatic event and provide possibilities—both real and imagined— for working it through. The paper argues that in the wake of trauma, social media profiles become “potential spaces” and new “locations of cultural experience,” in D.W. Winnicott’s use of the terms. The representation of traumatic events through social media sites will be discussed in relation to incidents such as the Boston Marathon bombing, the Ferguson shooting, and the 2011 Norway attacks, to help illustrate theoretical propositions.
O1732
ASSESSING QUALITY-ORIENTED LEADERSHIP IN HIGHER EDUCATION INSTITUTIONS – RESULTS FROM THE HEIQUALITY CULTURES PROJECT –

D02. Work and organization - Leadership and entrepreneurship

Christine Sattler, Heidelberg University, Heidelberg - Germany
Karlheinz Sonntag, Heidelberg University, Heidelberg - Germany
Katja Götzen, Heidelberg University, Heidelberg – Germany

The implementation of quality management procedures represents one of the major challenges of higher education institutions (HEIs). In this context the decisive role of quality-oriented leadership has been frequently emphasized. However, the empirical assessment of quality-oriented HEI-leadership has hardly been addressed systematically so far. In order to fill this research gap we developed the empirically based Quality Culture Inventory (QCI) within the framework of the heiQUALITY Cultures Project (Sattler et al., 2013). Quality-oriented leadership was operationalized by 12 items relating to the transformational leadership concept. Exploratory and confirmatory analyses suggest a 2-factor leadership model: While the first factor represents “high performance expectations” the second factor summarizes “quality-oriented leadership actions” (e.g. providing an appropriate role-model concerning quality at work). Self-ratings of leaders (N=141) were found to be significantly higher than staff ratings (N=648). Moreover, quality-oriented leadership was positively related to several desirable organizational outcomes such as HEI-commitment and job satisfaction. Discrepancies between self-ratings and external evaluations provide valuable suggestions for quality-oriented leadership interventions. Moreover, results suggest that fostering a culture of quality-oriented leadership may lead to an enhancement of numerous desirable organizational outcomes in HEIs.
The present study represents a contribution to the quantitative outcome research of career guidance interventions. Based on the construct of vocational maturity (Super, 1983) and its development (e.g. Peterson et al., 2002), a career choice readiness (CCR) measure for young people had been developed. This 16-items self-report instrument assumes 5 dimensions of CCR: problem awareness, vocational self-evaluation, level of vocational information, decision behaviour, and realization activity. Clients completed the questionnaire before and a few days after a career guidance intervention (voluntary initial one-to-one counselling provided by the Federal Employment Agency; round about 1 hour). The sample consists of 229 clients: 125 females and 104 males, aged 13-31 (M = 16.89, SD = 2.16). Results suggest a positive change of CCR initiated by the counselling session (t (228) = 5.90, p<.001; Cohen’s d= .30). Moreover, effects are moderated by the level of problem awareness (low vs. high) clients had before career guidance (Cohen’s d = .49 vs. .20), suggesting problem awareness to be a critical precondition for CCR. Thus, further analyses are run for this two-group comparison, inspecting relevant moderator variables, e.g. educational attainment and status variables as sex, age, or gender. Implications for research and common practice are derived. Summing up, results clearly show that the investigated counselling interventions have a positive effect on the CCR of young people.
The aim of this study was to investigate whether or not there is a mediator role of positive views of self, world and future on the relationship of psychological resilience with depressive symptoms and life satisfaction in university students. For purposes, The Cognitive Triad Inventory was translated into Turkish. The confirmatory factor analysis was used in order to test the scale’s factor structure. The results revealed that the Cognitive Triad Inventory is a validated and reliable measure of cognitive triad among Turkish university students. The sample of this study was collected from 737 university students using online survey system. The final analysis was done over 610 participants who experienced at least one of the risk factors from The List of Determining Risk Factors. The Cognitive Triad Inventory, Ego-Resilience Scale, Life Satisfaction Scale and Beck Depression Inventory were applied to the students. Hierarchical regression analyses were carried out for answering research questions. Findings showed that resilience is significantly related to positive cognitions about the self, the world, and the future. The mediator role of the positive cognitive triad on the relationship of psychological resilience with depressive symptoms and life satisfaction was supported. Individuals who had higher level of resilience held significantly more positive cognitions and reported significantly higher levels of life satisfaction and lower levels of depressive symptoms.
O1738
THE EFFECTS OF ATTACHMENT ON MARITAL ADJUSTMENT IN TURKISH NEWLYWEDS: THE MEDIATOR ROLE OF CONFLICT RESOLUTION STYLES

E06. Health and clinical intervention - Family treatments

Sedef Tulum, Dokuz Eylül University, İzmir – Turkey
Hürol Fişiloğlu, Middle East Technical University, Ankara – Turkey

The main aim of the current study was to investigate the mediating role of conflict resolution styles in the relationship between attachment dimensions (i.e., attachment anxiety and avoidance) and marital adjustment in Turkish newlyweds. This study sought to extend the previous work by using a homogeneous newlywed sample (i.e., being married for up to 5 years, childless, and in the first-time marriages) to detect the determinants of marital adjustment better by eliminating confounding variables. 380 newly married individuals completed measures of Experiences in Close Relationships-Revised, Dyadic Adjustment Scale, and Conflict Resolution Styles Scale. Two multiple mediator models suggesting that the relationship of attachment dimensions to marital adjustment was mediated by the conflict resolution styles was tested by using mediational analysis with Bootstrapping sampling method. Analyses revealed that negative conflict resolution style partially mediated the relationship between both dimensions of attachment (i.e., anxiety and avoidance) and marital adjustment. Findings highlighted the importance of dysfunctional conflict resolution styles as an underlying mechanism through the relationship between attachment characteristics and satisfaction in newlywed marriage. These findings may be beneficial for the clinicians when working with newlyweds to help the clients change their dysfunctional behaviors into more adaptive ones and enhance their marital satisfaction.
O1745
CROSS-CULTURAL ADAPTATION OF THE ORGANIZATIONAL BEHAVIOR TEST AND A COMPARATIVE STUDY BETWEEN TRANSITION AND DEVELOPED ECONOMIES

D05. Work and organization - Organizational behaviour

Jolanta Kowal, University of Wrocław, Wrocław - Poland
Alicja Keplinger, University of Wrocław, Wrocław - Poland

State of the Art and Purpose. The article focuses on the process of adaptation of the new research tool to examine the ethical differences of human capital development between transition and developed economies, in information systems. The goal of the study is to test the differences concerning the relation of organizational citizenship behaviors (OCB) between transition and developed economies, on the example of Poland and Germany. Design/Methodology. The qualitative and quantitative methods were used during the process of translation, adaptation, validation and reliability verification of the new tool and the research hypotheses testing. The structured online survey comprised adapted questionnaires in Polish and German studies: Employee Behavior Questionnaire (EBQ). The studies are based on two random samples of 60 IT users in Poland and in Germany. Results. The new tool was elaborated in Polish and English languages. The differences of OCB of IT Users were examined between countries, with consideration of the socio-economic features of transition and developed economies. Limitations. Studies should be continued in other transition and developed countries for more numerous research samples, in various branches of the economies. Research/Practical Implications. The conclusions of our research can be addressed to IT Users and professionals, especially HR staff in transition and developed economies. Analyzing the differences of OCB and popularizing ethical ideas in mentioned above economies can be a factor of human and economic development that increase efficiency and commitment. Originality/Value. The study fill a gap in the field of socio-economic IS development research with new tool concerning ethical attitudes - OCB components. The cultural differences between transition and developed countries were indicated in the field of the factors of OCB increasing, first time together in Poland and in Germany. Keywords: developed economy, differences, IT Users, Organizational Citizenship Behaviors (OCB), Poland, transition economy, Germany.
EFFECTS OF ABILITY AND EFFORTS ON POWERHOLDERS' ALLOCATION

The present research examined whether obtaining power through efforts or by ability would affect resource allocation of powerholders. According to equity theory, a person’s fair allocation takes into account the input-relevant variables, like effort and ability. Ability is more closely related to contribution than efforts. A person who obtains power by ability may believe that he/she is entitled to more rewards. We propose that input of ability in obtaining power may explain the selfish resource allocation of powerholders, and entitlement is a mediator between the ability input and selfish resource allocation of powerholders. In Study 1, we found that it was the participants who obtained power by ability, not the participants who obtained power through efforts, allocated themselves more resources than those who were assigned to their power position. In study 2, we replicated the result of Study 1, and found that entitlement mediated the relationship between input of ability in obtaining power and resource allocation of powerholders. We conclude that the powerholders who obtains power by ability are more likely to feel entitled and feeling entitled leads to more selfish allocation.
THE EFFECTIVENESS OF ANGER CONTROL GROUP TRAINING WITH MICHAEL FREY APPROACH ON REDUCING AGGRESSION OF MALE PRISONERS IN SHAHREKORD CENTRAL JAIL

Ghasem Naziri, Islamic Azad University, Shiraz - Iran
Sadrollah Khosravi, Islamic Azad University, Firoozabad - Iran
Masoumeh Hamidi, Islamic Azad University, Yasouj - Iran

The effectiveness of anger control group training with Michael Frey approach on reducing aggression of male prisoners in Shahrekord central jail. The purpose of this study was to evaluate the effectiveness of teaching control anger Michael Frey ways to reduce aggression in male patients of Shahrkord Central Penitentiary. Method of research was pre-test post test experimental design with a control group. The population consisted of all male patients in Shahrekord Central Penitentiary was 93-92. Using a multistage cluster sampling method to select 24 prisoners, and AGQ aggression questionnaire, Najarian (1379) they were taken. And then were randomly assigned to experimental and control groups. 12 training session 1.5-hour each, were held for experimental group exposed to anger control by Michael Frey. Post test and one month follow up were run for two groups. Data were analyzed using analysis of variance with repeated measures. The results showed that the aggressiveness in the two groups in the pretest, posttest, and follow-up, was a significant difference. The results of this study it can be concluded anger management training is effective in reducing aggression in male patients. Keywords: aggression, Michael Frey approach, group training.
O1760
EFFECTIVENESS CREATIVITY TEACHING ON THE COPING STYLES OF SHIRAZ HIGH SCHOOL STUDENTS

B09. Development and education - Adolescent adjustment

Masoud Mohammadi, Islamic Azad University, Shiraz - Iran
Sareh Behzadipoor, Islamic Azad University, Shiraz – Iran
Ghasem Naziri, Islamic Azad University, Shiraz – Iran
Sadrollah Khosravi, Islamic Azad University, Firoozabad – Iran
Masoumeh Hamidi, Islamic Azad University, Yasouj – Iran

The aim of this research was determine of efficacy of creativity training on coping styles of students. Research way is experimental and with pre-test and post test with control group. Society statistic including all of the boy students third-year junior high school government Razi that is consisted of one hundred patients. Using purposive sampling, 30 patients were selected and randomly divided into two experimental and control. Questionnaire measurement tools was guidelines adolescent coping scale (Fraydnbrg and Lewis). Covariance results show that between styles coping two groups is different meaning (p<0.05). This means of creativity teaching is significant effect on the coping styles. Based on this results it can be concluded the creativity teaching effect on the coping styles students. Key words: coping style, creativity training, students.
THE MEDIATOR ROLE OF EARLY MALADAPTIVE SCHEMAS BETWEEN PERCEIVED PARENTING STYLES AND SOCIAL ANXIETY SYMPTOMS

E05. Health and clinical intervention - Evidence based psychotherapies

Zeynep Perin Seyitoğlu, Okan University, Istanbul - Turkey
Dilek Sirvanlı Özen, Okan University, Istanbul - Turkey

Tendency to interpret social situations as threatening, perceive others as being critical, and having a sense of inefficacy and incompetence to deal with social situations are defined as central themes in Social Anxiety Disorder and several parenting styles have been proposed to influence the development of such social fears. However it is not clearly understood how negative parenting styles interact with the child’s temperament and what may possibly mediate between parenting styles and social anxiety symptoms. As one possibility that hasn’t received much attention, early maladaptive schemas(EMSs), defined as self-perpetuating dysfunctional cognitive structures that developed during childhood, can act as mediators between parenting styles and social anxiety symptoms. Therefore; the aim of this study is to demonstrate the mediator role of EMSs between perceived parenting styles and social anxiety symptoms and to explore the roles of gender differences and different parenting styles received from both parents in determining the severity of social anxiety symptoms. The plan is to have 300 university students complete measures of EMSs, social anxiety symptoms and perceived parenting styles via Young Schema Questionnaire- Short Form 3, Liebowitz Social Anxiety Scale and Young Parenting Inventory. This research is still at the stage of data collection. After the necessary data collection the appropriate statistical analyses will be conducted to answer the main research questions and the results will be discussed according to relevant literature findings.
This work presents a meta-analysis on the Self-Referencing (SR) task. The SR is an evaluative learning paradigm that relies on the positivity of the self to induce attitude change towards target objects. The additional peculiarity of the SR is in its learning mechanism. In its standard version, the learning procedure consists of a double classification task through which participants press the same key to classify self-related words and target A-related stimuli and another key for other-related words and target B-related stimuli. With this procedure, the positivity of the self transfers to target A. More than 35 studies (N > 4000) showed SR effectiveness on both implicit and explicit attitude change towards target stimuli (d > 0.55 and d > 0.35, respectively). Furthermore, some recent studies capitalized on the properties of the self to demonstrate the effectiveness of the SR on extra-evaluative domains (i.e., accessibility and identification). In the present work, we review cumulated research on SR to identify which variations affect its efficacy. We focus our attention on three types of moderators inherent to the SR task: Stimuli (e.g., type of source and target used), procedure (e.g., memory of the correct vs. incorrect intersecting regularity), and consequence (e.g., evaluative vs. non-evaluative domain). We discuss the findings in light of the moderating role played by each of these aspects on SR effect, with an emphasis on new advances in this line of research.

EFFECTIVENESS OF TEACHING COMMUNICATIVE PATTERNS OF PLURALISTIC FAMILY ON PSYCHOLOGICAL WELL-BEING AND SOMATIC-MENTAL SYMPTOMS OF WOMEN WITH PSYCHOSOMATIC DISORDERS IN SHIRAZ

Sadrollah Khosravi, Islamic Azad University, Firoozabad - Iran
Masoumeh Hamidi, Islamic Azad University, Yasouj - Iran

The purpose of this study was to measure the efficacy of teaching communicative pattern of pluralistic family on the somatic symptoms of women. This experimental study was designed to have a pre-test and post test and also a control group. Subjects of this study were comprised of Medical Centers clients in Shiraz and was based on random sampling. Thirty women were selected according to the revised version of family communication patterns of Koerner and Fitzpatrick. Two dimensions, laisseze fair and protective family patterns, were taken into account through the process of selection. Psychosomatic disorders questionnaire was administered to 30 women and they were randomly divided in to a control and an experimental group. Ten training sessions, 90 minute each, were held for experimental group exposed to pluralistic communication patterns. Tests were run for two groups. The result of covariance analysis revealed that with regard to somatic symptoms, there is a significant difference in both groups (p<0.001). But there is not significant difference between experimental and control groups in the aspects of mental symptoms (depression, anxiety, stress) and psychological well-being. Based on this results, it can be concluded that pluralistic communication methods based on high levels of listening speaking interactions can be effect in reducing somatic-mental symptoms and increased psychological well-being in women. Keywords: communication pattern, psychological well-being, Psychosomatic

SOLUTION-FOCUSED SELF-HELP TOOL: DEVELOPMENT AND EFFECTIVENESS

F01. EXPO 2015 Hot Topics - Capacities building and human development

Rytis Pakrosnis, Vytautas Magnus University, Kaunas – Lithuania
Viktorija Cepukiene, Vytautas Magnus University, Kaunas – Lithuania

A number of self-help tools have been introduced during last decades striving for cost-effectiveness and accessibility of psychological help and relying on the idea that people are capable of changing on their own. Solution-focused approach stresses the idea of constant change, person’s strengths and ability to initiate positive change. Both approaches share strive for achieving maximum with minimal amount of effort. Despite these communalities, there are only few available tools of self-help based on solution-focused ideas with no data on their effectiveness, however. The presentation is aimed at presenting the solution-focused self-help tool developed by presentation authors: the idea, the development steps (paper&pencil worksheet; computerized tool; interactive computer program), examples, main outcome results in each step of the development, possibilities for practical implication and further development. Outcome studies in each step of the self-help tool development were conducted in the groups of psychology students. Study design in all cases involved comparison groups with pre- and post- intervention evaluations using subjective and standardized measures. Results revealed that positive changes in the life area chosen for change by participants were significantly larger than in comparison groups when applying all forms of solution-focused self-help. Besides, magnitude of positive change tends to grow along with the increase of the interactivity of the self-help tool.
Recent studies and meta-analyses repeatedly demonstrate the effectiveness of self-help methods (standardized interventions helping clients to work on their issues without major help from helping professionals) and comparability to the outcomes of traditional psychotherapy. There is some evidence that solution-focused approach, emphasizing strengths of a person as well as continual change, could be a good base for self-help. However, there is only limited research data to prove this. The aim of this study was to evaluate the outcome of interactive solution-focused self-help computer program in the sample of university students. The study procedure involved pre- and post- intervention evaluations with one month in-between. The self-help program invited participants to work on a chosen life area by reflecting on their desired future, strengths/resources, actions, clues of positive change, progress etc. The evaluation of the outcome combined subjective (10 point scales) as well as standardized (OQ-45; Self-Reflection and Insight Scale;URICAS: Psychotherapy version) measures. The data collection is still in progress. We expect to have about 70 students in the experimental group. The comparisons of all measures at pre- to post- intervention will be presented along with the ideas for implication for practice and further studies. Preliminary results show that assessed intervention is useful in helping students to improve their psychosocial functioning.
In this short paper we suggest some hypotheses on the interaction between the mind and the current, and potentially most shocking, techno-scientific innovations, especially focusing on the emotional dimension. Our conceptualisations are largely due to intersections of several vertices capable of a successful hybridisation. With the term techno-scientific apparatus we refer to the global unfolding of a network virtual dimension where, potentially, individuals and groups are interconnected each other and can access to an undefined amount of information which was produced partially by themselves. Following the developments of Bion’s thought, we shall consider the mind as an unsaturated function of emotion processing and sensory perceptions that need to be turned into a dreamlike film to be devolved later to the unconscious. The hypothesis we suggest here is that the virtual dimension leads to a 'real' sensory and perceptual dimension expansion which is described by the term virtual only partially, as it could lead one to think to the man-machine relationship only as a progressive dematerialization and evaporation of traditional relational ways. Ironically, in the virtual relationships there would be 'too much undeveloped corporeity' with an initial stimulating and mood enhancing effect which would lead the individual to the creation of autistic black holes of restricted sensitivity which is impossible to work through.

JOB DEMANDS AND RESOURCES IN PSYCHOTHERAPY TRAINING AND THEIR RELATIONSHIP TO PSYCHOLOGICAL STRAIN

E01. Health and clinical intervention - Assessing and accrediting quality of psychotherapy training and practice

Sandra Schladitz, University of Education, Freiburg - Germany
Marie Druege, University of Education, Freiburg - Germany

This study aims at analyzing the relationships between working conditions in psychotherapy training and psychological strain in trainees. Past research has shown that even though working conditions such as financial compensation (Hölzel, 2006) are precarious and trainees show higher stress symptoms than a reference sample, most of them are satisfied with the content of their training (Grundmann, Wingenfeld, & Sude, 2013). However, so far the direct link between working conditions and psychological strain has not been established. A sample of psychologists currently in psychotherapy training is obtained by contacting training institutes and via social networks. They provide information about their training content and progress, followed by questionnaires assessing demands (e.g. emotional demands) and resources (e.g. self-efficacy) at work as well as psychological strain (e.g. emotional exhaustion). It is expected that high demands correlate positively with psychological strain and that high resources negatively. According to the Job-Demands Resources Model (Demerouti, Bakker, Nachreiner, & Schaufeli, 2001) we also expect an interaction effect in the sense that high resources can buffer the relationship between demands and strain. Based on this information curricula in training institutes may be improved to guarantee satisfaction and good psychological health of their future psychotherapists.
The purpose of this study was to determine the predictive role of family communication patterns of self compassion and mindfulness for students. The study was descriptive and predictive correlation. The population was all of university students in Yasouj in the academic year 94-93. The sample of 162 subjects (81 females and 81 males) who were selected randomly to questions on family communication patterns Kuerner and Fitzpatrick (2002a) and short form scale of self compassion Neff (2003) and Inventory of Mindfulness pentahedron Bauer(2006) responded. Results were analyzed using the spss software. Results of regression analysis showed that the conversation orientation, a significant positive predictor of mindfulness, but is not able to predict self compassion students, while the conformity-orientation compliance and significant negative predictor of self compassion and mindfulness in students. Other results showed that there is the simple and meaningful relationship between mindfulness and self compassion. Keywords: family communication patterns, self compassion, mindfulness, students.
O1783
A QUANTITATIVE STUDY OF THE CHANGES AND DIFFICULTIES DURING THE TRANSITION FROM JUNIOR TO SENIOR ELITE ATHLETE

E10. Health and clinical intervention - Sport and exercise

Nathalie Rosier, Vrije Universiteit Brussel, Brussels - Belgium
Paul Wylleman, Vrije Universiteit Brussel, Brussels – Belgium
Veerle De Bosscher, Vrije Universiteit Brussel, Brussels – Belgium
Jo Van Hoecke, Vrije Universiteit Brussel, Brussels – Belgium

Although considered one of the most challenging transitions during an athletic career, few empirical data is available on the junior-senior transition. Using the Holistic Athletic Career Model (HACM; Wylleman, De Knop, & Reints, 2011) as conceptual framework this study aimed at identifying the changes and difficulties athletes experience at athletic, psychological, psychosocial, academic/vocational, and financial level when transitioning from junior to senior elite athlete. A questionnaire based on the HACM, the Transition Monitoring Survey (Stambulova, Franck, & Weibull, 2012) and on 27 interviews (10 high performance directors, 10 athletes who are still active and 7 athletes who already dropped out), was used to collect data from athletes one to three years after their transition from junior to senior level. Preliminary results indicate that athletes experience changes at each of the five levels of development including a higher level of and more rivalry at competition, changing lifestyle, less good relationship with friends, more workload at academia etc. The challenges faced by athletes are expected to diminish in time (e.g. from senior year 1 to senior year 3). Recommendations on support provision to athletes facing the junior-senior transition include support after athletes finish elite sport school, preparing athletes mentally (e.g. patience, time management) and giving them sufficient support at academic level.
O1784
THE RELATIONSHIP BETWEEN COUPLE’S MOOD AND RELATIONSHIP SATISFACTION: A DIARY STUDY

B04. Development and education - Attachment and intimate relationships

Elçin Gündoğdu-Aktürk, Middle East Technical University, Ankara – Turkey
Bülent Aykutoğlu, Middle East Technical University, Ankara – Turkey
Büşra Akgönül, Bilkent University, Ankara - Turkey

The aim of the present study was to examine whether there is a relationship between couple’s positive and negative affect, and their relationship satisfaction. For this aim, couples (N=37) were asked to complete daily records for 14 consecutive days. Multilevel analyses indicated that daily positive and negative affect were related with daily relationship satisfaction. Moreover, apart from one’s own negative affect, one’s partner’s negative affect was negatively related with one’s own relationship satisfaction. In coregulation (as one specific form of interpersonal emotion regulation due to attachment relationship) literature, as a developing relationship field, it was indicated that partner’s negative mood was positively associated with own negative mood, compared to partner’s positive mood interactivity. Furthermore, there are also findings about buffering effect of high relationship quality on partners’ negative mood (see Saxbe & Repetti, 2010). The findings of the present study regarding the relationship between daily negative interpersonal emotion regulation and daily relationship satisfaction will also be discussed based on the relevant literature.

Keywords: positive and negative affect, relationship satisfaction, diary study
The study focuses on the possible correlation between child with leukemia and maternal coping strategies, and between child and maternal locus of control. Significant differences between the treatment and the maintaining phases are also investigated both in children and their mothers. The study involved 40 children with cancer, and a group made up of their mothers, recruited into two Pediatric Onco-Hematology Unit in Italy. The used tools were: the Child Behavioral Style Scale (CBSS) and the Monitor-Blunter Style Scale (MBSS) to investigate the child and maternal coping strategies; the Locus of Control Scale for Children and the Parent Health Locus of Control Scale (PHLCS) to analyze locus of control both in children and mothers. There were statistically significant correlations between child internal locus of control and Professional (r=.752, p<.01) and Parental influences (r=.412, p<.01) over child health. Also there were statistically significant correlations between child external locus of control and Professional influences (r=.599, p<.01), Fate (r=.437, p<.01) and Divine (r=.339, p<.05). There were no statistically correlation between child and maternal coping strategies. Therefore, there were no statistically significant differences between the treatment and the maintaining phases. The outcomes show several interesting resources of the psychological functioning of children with leukemia as well as of their mothers for the psychological and social adjustment.
Previous research unambiguously conclude that children with attention-deficit / hyperactivity disorder (ADHD) are at elevated risk of being involved in bullying either as aggressors or as victims in comparison with typical children. It has been shown that poor social competence, low peer acceptance, high peer rejection, and having few or no friends, as frequent problems of children with ADHD, are predictors of victimization by peers. Given the identified high risk for children with ADHD, the issue of predictors of peer victimization for children with ADHD in an international scientific context is not given enough attention. This study aims to contribute to the clarification of the factors that contribute to the peer victimization of children with ADHD. The study sample comprised 120 children, age 11 to 15 years, with ADHD (N=60) and without ADHD (N=60) and their teachers. The peer victimization had been evaluated by the children themselves using The School Bullying Questionnaire (Buljan Flander, Karlović, Štimac, 2003) and by their teachers (N=50) using the adaptation form of this questionnaire. The results of regression analysis showed that bullying and acceptance from other peers are significant predictors of victimization from the teacher point of view.
Animal-assisted therapy (AAT) has shown positive effects in reducing depression and agitation in older adults with dementia (see Bernabei et al., 2013). The aim of the present study was to investigate the efficiency of AAT as a non-pharmacological intervention to manage neuropsychiatric symptoms of patients suffering from severe senile dementia residing at a nursing home care unit in France. The AAT sessions took place once a week for one hour and were conducted by a psychologist certified in AAT, with her own dog and at least one member of the nursing staff. The 11 participants (mean age = 82.91 years, mean MMSE = 6/30) were encouraged to interact with and to take care of the dog (e.g., to pet, brush, feed, talk to her, etc.) and to remember memories involving animals. Effects on neuropsychiatric symptoms were assessed twice, before and after the five-month intervention, with the Neuropsychiatric Inventory (NPI, Cummings et al., 1994). The results show non-significant but tendencial decreases (p<.10) in the total scores for depression, euphoria, and aberrant motor activity. Regarding the caregivers’ distress scores, significant decreases (p<.05) were observed for depression, aberrant motor activity, and disinhibition, and by tendency a decrease of delusions and euphoria. In summary, these results point to the use of AAT interventions as an effective non-pharmacological alternative to reduce neuropsychiatric symptoms of dementia.
DO WHAT YOU LOVE TO DO: THE SHAPING OF OPTIMAL IDENTITY FROM OPTIMAL EXPERIENCE

A14. General issues and basic processes – Personality
Yanhui Mao, Sapienza University of Rome, Rome - Italy

The Eudaimonistic identity theory, which is built on Aristotle’s philosophy of Eudaimonia and Erikson’s theory on Identity, suggests an association of identity with activity: the activities one carries out are important for one’s own identity. More precisely, an individual starts to recognize elements of his or her true self, including interests, talents, and abilities, through participating in personally salient identity-related activities, which have also been labeled as self-defining activities. Some salient features of activity experience could be important for the individuals’ subjective well-being, such as flow (optimal experience), an affective-cognitive mental state in which a person performing an activity is fully immersed in a task, with full concentration, intense enjoyment, intrinsic interests in the activity process. Also feelings such as those of personal expressiveness can be part of the identity experience during activities reflecting one’s core sense of being. These two activity experiences have been well addressed in research records, and the association between these two constructs are traced in fewer studies, although the empirical evidences are not systematic, yet are basically focused on personal identity only. The present contribution wants to bring more substantial quantitative evidences and to test such a link with reference to three different features of a person’s identity, namely: personal, social and place identity. Based on Eudaimonistic identity theory, it is hypothesized that the relationship between flow experience and identity strength of a person would be positive, through the participation in self-defining activities, specifically, : the higher the degree of flow experience, the higher the definition or strength of a one’s identity. By applying standard and specific scales for measuring flow and identity, three correlational studies are carried out to test this hypothesis, via different samples from various national background, separately for the three different features of identity: personal, social and place identity. Research findings are in line with the main hypothesis, and are discussed with reference to the literature on both Eudaimonistic identity theory and flow theory. Implications are discussed for building a coherent self-identity in the process of self-definition, as well as in the form of belongingness to social groups or to specific places. Possible future studies on flow and identity relations are suggested too.
O1792
PSYCHOTHERAPY "GENDER-SENSITIVE"

E01. Health and clinical intervention - Assessing and accrediting quality of psychotherapy training and practice

Annamaria Petito, University of Foggia, Foggia – Italy
Salvatore Iuso, University of Foggia, Foggia - Italy
Tiziana Pagano, University of Foggia, Foggia - Italy
Luisa Volpe, University of Foggia, Foggia - Italy
Vincenzo Orsi, University of Foggia, Foggia - Italy

Objective: recognizing the ideas about gender as constructions can help psychotherapist to be more easily able, through therapeutic relationship, to deconstruct some premises that can block rigid gender relations and generate suffering. Background: the psychology and the social sciences have long expressed a male-only point of view, or "womanless psychology", and the lack of sensitivity to "gender" has made an "asexual" psychotherapy. Points highlighted: a) in clinical practice, there is an increased presence of sexual prejudices: eg. depression among women is considered a normal effect both of their biological nature (the biological hormonal cycle) and their psychology (dependent personality); b) sharing the reflection on how many ideas about gender are "socially constructed" in "clinical reality" opens up the possibility of freeing the rigid sex roles from premises; c) the patient can be helped, through dialogue with the therapist, to deconstruct their own reality and to recognize it as one of many possible realities. Conclusions: "gender-sensitive" psychotherapy, means both the understanding of the premises about gender, and the ability to communicate with patients in therapy simultaneously on both their assumptions concerning women and male premises.
Accidents statistics show that older drivers are over-represented in intersection accidents, especially when turning left. Our study aims at better understanding how ageing affects the driving abilities of elderly drivers in this situation. Three groups of drivers, young (25-35 years), younger-old (60-69 years), and older-old (70 and more) took part in the study. The experiment consisted in two parts. Perceptual, cognitive and motor abilities were assessed in the first one. The second one took place on a driving simulator. Participants had to decide if they could perform a left turn at intersections. Traffic conditions were varied. Statistical analysis showed the classical age-related perceptual, cognitive and physical declines. With regard to driving performance, elderly drivers accepted fewer left-turns than younger drivers, but exhibited more risky behaviors, especially when traffic was complex. Two patterns emerged from correlations between test results and driving behavior. Driving performances of young people showed that both their cognitive and perceptual abilities correlated with driving performances, but not their motor abilities. As for elderly people, cognitive and motor abilities were connected to driving performance, but not their perceptual abilities. Regressions are being processed in order to detail the relationships between the different variables. Results will determine the most relevant predictors of risky behaviors among elderly drivers at intersections.
Impulsivity and inattention in childhood and early adolescence predicts a number of outcomes in later life including substance use, school performance, criminal justice involvement and psychological wellbeing. The development of slow, reflective decision-making and impulse control is an important life skill, but is poorly understood and typically only explored in populations with clinical disorders. Only one study using medicated children diagnosed with Attention-Deficit/Hyperactivity Disorder (ADHD) has previously used the Information Sampling Task (IST) to measure reflection impulsivity and decision-making. In this study, 84 typically developing children aged between 6-11 (males=36, females=48) were recruited to the study through a family public engagement event at the University of Nottingham. The IST was delivered through the Cambridge Neuropsychological Test Automated Battery (CANTAB) and was renamed the ‘Box Explorer Game’ in order to appeal to children. General symptoms of inattention and impulsivity were measured through the self-report Strengths and Weaknesses of ADHDscale (SWAN).Vocabulary and social development measures were also taken. IST performance correlated with real world symptoms of impulsivity on the SWAN, particularly when in conditions of uncertainty. Specifically, the probability of the child being correct at point of decision related to higher levels of inattention and hyperactivity. Performance wasn’t related to general vocabulary knowledge or social development. The IST may be an appropriate and useful way of measuring impulsivity and decision-making in young children and early adolescents as well as predicting early symptoms of ADHD.

EXPERTISE EFFECT ON AGEISM AND BELIEFS ABOUT ELDERLY'S COGNITION

E15. Health and clinical intervention - Aging and dementia

Camille Herbert-Mora, Université de Picardie Jules Verne, Amiens - France
Davy Castel, Université de Picardie Jules Verne, Amiens - France
Alexandra Gheorghiu, Université de Picardie Jules Verne, Amiens - France
Veronique Quaglino, Université de Picardie Jules Verne, Amiens - France
Mathieu Hainselin, Université de Picardie Jules Verne, Amiens - France

A growing number of studies focus on the negative consequences of ageism (i.e.: the presence of negative stereotypes toward seniors) regarding cognition’ evolution in the elderly. In this stream of research, very few studies evaluated the effect of expertise on ageism. This study evaluated beliefs towards elderly’s cognitive abilities (executive and instrumental functions, attention, memory, and processing speed) among 3 groups which differ in the level of expertise: non-expert (Bachelor students in unrelated fields, N1 = 89), semi-expert (Master students in neuropsychology, N2 = 15), and experts (neuropsychologist specialized on aging, N3 = 21). On most items, the 3 groups considered that elderly’s performances are weaker than those of 25 years old people. Experts’ beliefs differ from non-experts’ beliefs on 2 dimensions: they have a more negative representation of the elderly’s capacities regarding attention and a more positive representation regarding instrumental functions (p < .01) than the non-experts. There is no significant difference among the 3 groups regarding the 3 other dimensions. Additionally, results show a larger response variance in the expert group than in the non-expert group. This study presents first results highlighting that ageism persists and remains mainly unchanged within expert groups. Hence, these findings drive attention to the potential role of self-fulfilling prophecies in cognition’ evolution in the elderly.
O1807

ARE PREDICTORS OF SUPPORT FOR SAME-SEX MARRIAGE AND SAME-SEX PARENTING THE SAME FOR MEN AND WOMEN?

C03. Culture and society - Sex and gender

Thérèse Scali, Department of Psychology, University of Liege, Liege - Belgium
Salvatore D’Amore, Department of Psychology, University of Liege, Liege - Belgium
Robert-Jay Green, Rockway Institute for LGBT Psychology & Public Policy, Alliant International University of San Francisco, San Francisco (California) - United States
Stéphanie Haxhe, Department of Psychology, University of Liege, Liege - Belgium

When studying the predictors of positive and negative attitudes toward same-sex marriage and same-sex parenting, gender appears to play a large role. Indeed, men and women do not show the same degree of support. This presentation aims at understanding the underlying psychological processes leading to these attitudinal differences and focuses on specific predictors of attitudes held by men and women. Attitudes were assessed through self-report questionnaires in a cohort of 1168 heterosexuals residing in Belgium (859 females and 308 males age 18 to 81). Participants were asked to answer sociodemographic questions and to report their contact with lesbian or gay people (number and satisfaction with those relationships). Other scales assessed their General Attitudes Toward Homosexuality (Da Costa, 2011); Attitudes Toward Lesbians and Gays (Herek); Support of Same-Sex Marriage (Katuzny & Green, 2013); and Support of Gay and Lesbian Parenting (D’Amore & Green, 2012). Analyses revealed that predictors of attitudes toward same-sex marriage and lesbian/gay parenting are different for men and women. For example, men’s support for same-sex parenting was predicted by age, political views, contact with GL, and gender-role traditionalism, whereas women’s supportive attitudes were predicted by religiosity, contact with GL, attitudes toward lesbians and concerns about morality and children’s well-being. This presentation contributes to a better understanding of males’ and females’ attitudes toward same-sex couples and families in a country where legislation grants civil rights to lesbian and gay persons.
O1809
SOCIAL IDENTITY AND PERCEIVED DISCRIMINATION IN ETHNIC RELATIONS: A STUDY ON THE TURKISH AND KURDISH ETHNIC GROUPS

C05. Culture and society - Group processes and intergroup relations

Ercan Şen, Ankara University, Ankara – Turkey

This study aims to examine relations between the Turkish and the Kurdish ethnic groups in Turkey from social psychological perspective. The study uses Social Identity Theory, Social Dominance Theory and Social Contact Hypothesis as its theoretical background. The sample group is consisted of 224 Turkish and 240 Kurdish participants. Results showed that there are important differences in ethnic identification, social contact and perceived discrimination subscales. Comparing to the Turks, the Kurds showed a higher ethnic identification level. Similarly it is found that, comparing to the Turks, the Kurds have a higher level of perceived discrimination at both individual and collective levels. The Kurds showed a higher level of social contact quantity and lesser level of social contact quality. The two ethnic groups have also showed differences in ethnic identification and political views. The Turks experienced a better identification level when they move towards right wing political view however the Kurds experienced a better identification level when they move towards left wing political view. Furthermore, the quality of social contact with the Turks significantly determines the prediction of individual and collective discrimination level among the Kurds. Keywords: Social Identity, Social Dominance, Social Contact, Perceived Discrimination, Turks and Kurds.
O1823
INFLUENCE OF AFFECTIVE, COGNITIVE, AND SITUATIONAL FACTORS ON DECISION-MAKING IN THE SITUATION OF NEGOTIATION: ON EXAMPLE OF “PRISONER’S DILEMMA”

A14. General issues and basic processes – Personality

Milana Khachaturova, National Research University Higher School of Economics, Moscow - Russian Federation

The problem of decision-making under uncertainty is becoming more and more significant in constantly changing world. Thus, it is important to study the role of factors that affect decision-making process of choosing interaction strategies in negotiation process from practical point of view. According to the theory of L.Thompson, J.Wang and B.Gunia, there are several levels of negotiation process and factors that influence decision-making process of choosing behavioral strategies. We argue that the effects of affective, cognitive, and situational factors are the most significant in decision-making process. In our research, we have tested the influence of affective, cognitive, and situational factors on decision-making. To simulate the process of negotiations, we conducted an experiment using “prisoner’s dilemma”. 150 people, 86 females and 64 males (mean age – 20.6), took part in our experiment. The results demonstrate that positive emotions increase the probability of choosing cooperative strategy. And at the same time, negative emotions increase the probability of choosing confrontation strategy. Priming attitude towards choosing cooperative strategy increases the probability that decision-making will be relevant to the primed attitude. In the situation of time scarcity people tend to choose confrontation strategy. Our results can contribute to the development of practical recommendations and applied programs.
O1827
MULTI SENSORY ROOMS BENEFITS: TWO CASE STUDIES

B12. Development and education - Typical and atypical development

Alba Barros, Universidad of Vigo, Pontevedra – Spain

The objective of this case study was to determine the influence of Multi Sensory Rooms (MSR) as a therapeutic alternative in the development of children with Spina Bifida and Williams Syndrome in four areas: communication, gross motor skills, social skills, attention and concentration. It also describes the Multi Sensory Rooms as a treatment facility with different exercises in each room. The first case was of a 3 year old girl with Spina Bifida myelomeningocele type, producing motor and intellectual disabilities. The second case was a boy of 4 years, with William Syndrome with intellectual disability and low muscle tone. Children attended MSR sessions one hour a week for 6 months. For documentation of the case observation and assessment of the areas of development, we used a checklist and parents’ interview. Following MSR sessions there was progress registered in all areas, especially in the gross motor area and social skills. This indicates that in these cases, MSR and physiotherapy rehabilitation produce positive progress in the children, evidenced by increasing their level of independence in performing activities of daily living.

HOPE WORK, ACADEMIC MOTIVATION AND ACADEMIC ACHIEVEMENT: EXAMINE A CASUAL MODEL IN UNEMPLOYED STUDENTS

B02. Development and education - School adjustment, academic achievement and learning disabilities

Ali Asghar Bayani, Islamic Azad University, Azadshahr – Iran

Aim: The aim of the present study was to examine the casual relationship hope work and academic achievement with mediating role of academic motivation among undergraduate unemployed students. Method: Three hundred and ten (190 males, 120 females) unemployed students were selected by cluster sampling from students of Islamic Azad university, Azadshahr branch. The research instruments used in this study were Hope Work Scale (HWS, Juntunen&Wettersten, 2006) and Academic Motivation Scale (AMS, Vallerand, et al, 1992). Academic achievement of the students was measured by their grade-point average. The data were analyzed using correlation coefficient and path analysis. The results indicated that hope work had indirect effects on academic achievement through academic motivation. Results: There was a significant positive relationship between hope work, academic motivation and academic achievement. Extrinsic motivation had indirect effects on academic achievement. Amotivation and intrinsic motivation had direct effects on academic achievement. Conclusion: The causal model about relationship between hope work and academic achievement mediated by academic motivation was confirmed. Key Words: hope work, academic achievement, academic motivation
CAREERS IN TRANSITION: ACCOMPANYING PARTNERS OF INTERNATIONAL STUDENTS

D15. Work and organization - Career guidance

Nancy Arthur, University of Calgary, Calgary - Canada

International education provides increasing opportunities for students to study in new countries and cultural contexts. International students have been identified as preferred immigrants and sources of human capital to fill shortages of highly skilled knowledge workers. However, the focus on international students has been highly individualistic without sufficient attention paid to their relationships and the influences of those relationships for integration into the destination country. Many international students are accompanied by their partners and other family members; however, the experiences of accompanying partners during cross-cultural transition have often been marginalized or ignored. The partners of international students are often not in school and do not have access to their usual support systems, they may feel socially isolated, and they may have to disrupt their own careers. The well-being and social integration of international students and their accompanying partners are important considerations for advancing longer term employment plans. This presentation will outline findings from a study focused on accompanying partners and how they described influences on their career development during the international transition. Their experiences attest to the importance of viewing international transitions in light of interconnected career goals.
O1844
THE ROLE OF OPTIMISM AND LONELINESS: APPLICATION OF SOCIAL COGNITIVE THEORY ON SOCIAL NETWORKING ADDICTION

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Mogu S. Yu, University of Macau, Macau - Macau
Anise M.S. Wu, University of Macau, Macau – Macau

Based on Social Cognitive Theory (SCT), this study aims to examine the effects of outcome expectancies and self-efficacy on social networking addiction. In the study, 403 university students were recruited via departmental system of research participant pool and voluntarily took part in an online, anonymous questionnaire survey regarding Internet use. Our findings revealed that, in this sample (44.8% males and 55.2% females; Mean age=19.05 years), almost all of our participants (99%) were using online social networking sites. It was observed that social networking addiction was strongly correlated with internet addiction. Moreover, younger students were more likely to report social networking addiction symptoms. As hypothesized, negative outcome expectancies of reducing use and lower self-efficacy to reduce use were associated with social networking addiction. Meanwhile, optimism and loneliness were also significantly correlated with SCT constructs and social networking addiction. Multiple hierarchical regression results showed that, after controlled for the demographic effects, loneliness, outcome expectancies, and self-efficacy remained significant in explaining the variance on social networking addiction. The findings provide practical implications to intervene with social networking addiction among university students.
Emotional Intelligence (EI) has been associated with a better psychosocial adjustment. Empirical have indicated that EI is linked positively with the quality of social relations and negatively with conflicting social behaviors such as aggressive behavior, disruption and bullying. The aim of this study was to analyze, specifically, the relationship between self-reported EI students and perception, both violence in the classroom as EI their class teachers. The sample consisted of 2210 students attending 5th and 6th grade of Primary School. The assessment measures used were the TMMS-24 (Fernández-Berrocal, Extremera and Ramos, 2004), a scale of IE self-reported; the PTMMS-24 (Sánchez, Montañés and Latorre, 2008), an adapted version of the above to assess the perceived EI; and Violence School Questionnaire CUVE 3-EP (Alvare, Alvarez-Garcia, Gonzalez-Castro, Nuñez and Gonzalez-Pienda, 2006). The results showed significant correlations between perceived violence in the classroom and factors Attention, Clarity and Repair. Also there were significant relationships between perceived violence in the classroom and factors EI class teachers as perceived by students. The potential impact of these results in relation to strategies that EI can provide to prevent violence and conflicting social behaviors in the classroom are discussed. Keywords: Self-reported Emotional Intelligence, Perceived Emotional Intelligence, Students, School Violence.
The purpose of this presentation is to review the latest innovations on mental health application programs (apps) for mobile devices, as well as discuss the potential risks and ethical dilemmas that may arise for counsellors and psychologists who embrace them in their practice. Mobile apps could revolutionize approaches to patient care by enhancing the quality of mental healthcare and support. They can provide tools for self-monitoring symptoms and behaviours, personalized feedback, motivational support, and psychotherapeutic advice. They can also be used for educational and training purposes, or for administering and scoring standardized assessments. However, mental health professionals should carefully evaluate the quality and accuracy of the apps, or whether they can safeguard the user’s data without compromising the therapist’s, or the client’s privacy and confidentiality. The most important issue that should be addressed is that only a small number of apps is designed by healthcare professionals, based on strong research, has findings of sustainable results for a period of more than three months, try to replicate these results or test the effects of these mobile interventions on everyday life, work and social functions in general. The importance of creating guidelines and certification programs for apps, as well as the professional’s contribution in publishing their findings, and improving their current practices through training is discussed.

EFFECTIVENESS OF MUSIC THERAPY INTERVENTION ON DEPRESSION AND ANXIETY OF POST TRAUMATIC STRESS DISORDER (P.T.S.D) VETERANS

C14. Culture and society – Music

Leila Esmaeili, University of Isfahan, Isfahan - Iran
Mohammad Hossein Pourabaeian Esfahani, University of Folad, Isfahan - Iran
Farzaneh Dabbashi, University of Isfahan, Isfahan - Iran

The purpose of this research was to determine the effectiveness of Music Therapy intervention on Depression and Anxiety of Post Traumatic Stress Disorder (P.T.S.D) veterans. This research was based on a quasi-experimental design with pre-test, post-test and control group respectively. The population also included Post Traumatic Stress Disorder (P.T.S.D) veterans Isfahan in 2013. In order to perform this study 60 of Post Traumatic Stress Disorder (P.T.S.D) veterans who were available selected (each group consisting 30). GHQ questionnaire was used to gather the data. Data were analyzed using Multivariate analysis. Music Therapy intervention was trained for 12 weeks on the experimental group and the control group did not have any intervention. The results showed that Music Therapy intervention had a significant effect on Depression and Anxiety in Post Traumatic Stress Disorder (P.T.S.D) veterans in post test (P=0.05). Over all this study the use of Music Therapy intervention effects on Depression and Anxiety of Post Traumatic Stress Disorder (P.T.S.D) veterans. Keywords: Music Therapy, Depression and Anxiety, Post Traumatic Stress Disorder (P.T.S.D) veterans.
The purpose of this research was to determine the effectiveness of forgiveness-based group intervention on positive relations with others and personal growth of veterans and their wives. This research was based on a quasi-experimental design with pre-test, post-test and control group respectively. The population also included veterans and their wives Isfahan in 2012. In order to perform this study 20 couples of veterans and their wives who were available selected (each group consisting 10 couples). Ryff psychological well-being questionnaire(1995) was used to gather the data. Data were analyzed using Multivariate analysis. Forgiveness-based group intervention was trained for 5 weeks on the experimental group and the control group did not have any intervention. The results showed that forgiveness-based group intervention had a significant effect on positive relations with others)P<0.01) and personal growth )P<0.02) were significantly increased in post-test. Keywords: Forgiveness-based group intervention, positive relations with others, personal growth.
O1858
EFFECTIVENESS OF EMOTION REGULATION THERAPY ON SELF-ACCEPTANCE & PURPOSE IN LIFE OF EPILEPTIC GIRLS

B06. Development and education - Emotion and self

Leila Esmaeili, University of Isfahan, Isfahan - Iran
Maryam Esmaeili, University of Isfahan, Isfahan - Iran
Saeideh Mahdavi, Islamic Azad University, Isfahan - Iran
Morteza Mirzaei, Islamic Azad University, Isfahan - Iran

Objective: Despite the existence of a large volume of literature and research on emotional regulation of the general population, very few studies have focused on emotional regulation of epileptic adolescence girls. The research purpose is to assess the Efficacy of Emotional Regulation on the Self- Acceptance & purpose in life of Epileptic Girls (14-20) in Isfahan. Method: In order to administer this study, 30 epileptic adolescence girls were selected from 14-18 years population of epileptic adolescence girls Isfahan city via random cluster sampling method and assigned randomly to experimental and control group (each group consist of 15 adolescence). The design of the study was comparative experimental and control group in pretest, post test and after 3 month follow up. The intervention was emotional regulation. Training based on Boston Program University. The instruments were psychological Well-Being(Ryff), questionnaire. Results: Data was analyzed by Multivariate Covariance analysis of variance. Findings indicate that emotional regulation effects on the Self- Acceptance and purpose in life of epileptic girls in follow-up (p<0.046). Conclusion: The results showed that emotional regulation effects on the Self- Acceptance and purpose in life of epileptic girls. Key words: Emotion Regulation, Epileptic girls, Self- Acceptance, purpose in life.

EXPLAINING THE LONG-TERM RELATIONSHIP BETWEEN
LANGUAGE AND SOCIAL COMPETENCIES BY PEER INTERACTIONS

B07. Development and education - Social cognition, identity and social interactions

Elisabeth Rose, University of Bamberg, Bamberg - Germany

Research in the field of child psychiatry (e.g. considering children with ADHD or specific language impairment) indicates that language and social skills do not develop independently, because a high comorbidity between language and emotional or behavioral disorders can be found, whereas deficits in early language predict later social skills. Accordingly, different explanation mechanisms are discussed. One possible approach is that low language skills are often linked to peer rejection, what could in turn result in problematic social skills. This suggestion could also explain a relationship between language and social competencies in the typical course of development. Therefore it was hypothesized that (a) early language competencies predict later social skills in typically developing children. Additionally, it has to be confirmed whether this direction is specific or bidirectional, because social interactions also may be an important prerequisite for language acquisition (b) this association is mediated by social interactions with peers, whereas early language competencies could lead to more peer interactions and improve later social skills as well as early social competencies could result in better peer relationships and have an effect on later language skills. Results will be based on a German longitudinal study with around 500 children followed from age three to ten. Parent’s and (preschool) teacher’s ratings on language and social competencies as well as objective language test instruments (e.g. PPVT; TROG-D) will be taken into account.
ON THE RELATIONSHIP BETWEEN WHISTLEBLOWING AND COMMUNICATION SATISFACTION AT WORK

Işıl Karatuna, Kırklareli University, Kırklareli - Turkey
Oğuz Başol, Kırklareli University, Kırklareli - Turkey

Whistleblowing, the act of speaking out about wrongdoing in the workplace, is considered to be a pro-active organizational behavior which warns potential pitfalls and helps prevent further damage to the organization. Prior research on whistleblowing suggests that individuals’ whistleblowing intentions might be influenced by organizational variables such as communication climate. Thus, this study examined the relationship between whistleblowing and organizational communication satisfaction by focusing on the divide between internal (reporting wrongdoing to an authority within the organization) and external whistleblowing (reporting wrongdoing to an outside agency). Data were obtained from a representative sample of 1,012 employees from various organizations in Kırklareli, Turkey. Communication satisfaction was positively associated with internal whistleblowing, whereas negatively associated with external whistleblowing and non-whistleblowing. Participants who perceived their organizations as non-supportive of whistleblowing preferred external whistleblowing channels or non-whistleblowing more than the employees with the perception of supportive organizations. The findings suggest that creating an effective organizational communication system would encourage a whistleblower to report wrongdoing internally, which in turn would help correcting the wrongdoing internally without causing damage to the organization's reputation.

GENDER FEATURES OF INTERACTION WITHIN CROSS-FUNCTIONAL MANAGERIAL TEAMS IN RUSSIAN COMPANIES

D03. Work and organization - Teams performance

Sofia Kosheleva, Saint Petersburg State University, Saint Petersburg - Russian Federation
Olga Voronina, Saint Petersburg State University, Saint Petersburg - Russian Federation

This study was conducted to compare team-role behavior of managers-women and managers-men in cross-functional teams in Russian companies and find the gender differences of behavior influences the efficiency of managers’ interactions in decision making process. Empirical data that was collected allows us to find gender differences in team-role preferences and their realization in interaction in decision making process. The research methodology was based on the Belbin’s team leadership theory and diagnostic technique of team roles. Using the three-stage methodology (diagnostic testing, observation of behavior during interaction, feedback) allows to draw a qualitative data comparison and provides for reliability of obtained results. The novelty of obtained results is connected with describing gender features of the managers’ professional and personal self-identification in the sphere of team-role interaction. One of important feature of the managers' team-role self-identification discovered in the study: the choice of the “foreground” team-roles reflects their orientation to the organizational requirements (psychological format “I must”) whereas the actual behavior reflects gender specifies of personal self-identification connected with realizing the “supporting” roles (psychological format “I want/I can”). At whole the results define the features of gender differences in the team interaction and can be used to develop of managers’ professional and personal potential.
A COMPARISON OF EXPERIENCE-SEEKING & DIS INHIBITION IN HIV-POSITIVE PEOPLE AND NORMAL INDIVIDUALS

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Zahra Esmaeili, Medical University of Isfahan, Isfahan - Iran
Leila Esmaeili, University of Isfahan, Isfahan – Iran
Saeideh Mahdavi, Shariati Hospital, Isfahan – Iran

The purpose of this study was the comparison of experience seeking and disinhibition in HIV positive people and normal individuals. Methods: The method of this research was casual- comparative, and the statistical population were HIV positive people in range of 14-45 year who were under observe and treatment in Behavioral Diseases Consultation Center of Navvab safavi in Isfahan in 2010. 30 male and female patients were chosen by access and compared to a group of 30 normal individuals who were similar in variables like age, gender, and education with sample group. The measurement instrument was Zuckerman fifth questionnaire form which has 40 items. Results: Data was analyzed using T test for independent groups with SPSS 18. The results indicated that the score of experience-seeking and disinhibition was higher in HIV positive individuals than normal individuals significantly. Keywords: experience-seeking, AIDS, disinhibition.
O1878
THE IMPACT OF PSYCHOLOGICAL DISTANCE ON INTEGRATION AND CONFRONTATION IN INTERNAL DIALOGUES

A14. General issues and basic processes – Personality

Malgortza Puchalska-Wasyl, The John Paul II Catholic University of Lublin, Lublin – Poland

The presented study aimed to answer the question if psychological distance (proximal vs. distant perspective on the situation enacted in self-talk) affects the processes of integration and confrontation in internal dialogues simulating social relationships. The study was based on two theories: the dialogical self theory together with its central concept of internal dialogue and the construal-level theory of psychological distance. It was found that an increase in psychological distance reduces the intensity of the confrontation process and is accompanied by a tendency of the number of integrative internal dialogues to increase. It was the first research on the potential relationship between internal dialogue and distance from the situation enacted in it. The study contributes not only to the dialogical self theory but also to the construal-level theory of psychological distance which theses have not been previously verified in the field of internal dialogicality. The results should be treated as inviting further exploration of the issue.
O1879
SUPPRESSION AND MARITAL SATISFACTION: THE MODERATING ROLE OF SPOUSAL SUPPORT

C02. Culture and society - Family systems and processes

Presenter: Tsui-Shan Li, Fu-Jen Catholic University, Taipei - Taiwan, Province of China
Wei-Fang Lin, Fu-Jen Catholic University, Taipei - Taiwan, Province of China

In Asian culture, suppression is a common strategy for resolving conflicts in marriage. However, previous researches suggested that suppression may lead to depression and worse relationship. Given that suppression in marriage usually aims to maintain relationship, we suggested that spouses’ response could be an important moderator contributed to different outcome. To examine our hypotheses, we invited 145 Taiwanese double-earner couples (290 individuals) to join our longitudinal study. All participants completed a package of questionnaires twice at one-year interval, which measured their suppression in marriage, spousal support provision, and marital satisfaction. We conducted an actor-partner interdependence model to understand the interaction between couples. Results indicated that there is a significant interaction between suppression and spouses’ support provision in regard to the change of marital satisfaction. Specifically, only for those whose spouses provided less social support, suppression in marriage decreased one’s own marital satisfaction. Besides, we also found that providing support to their spouses’ suppression could benefit one’s own marital satisfaction. Accordingly, suppression does not necessarily hurt relationship, it depends on whether individuals received social support from or provided it toward their partner.
O1881
COGNITIVE PROCESSES AND SPORTS PRACTICE IN DIFFERENT KINDS OF SPORT

E10. Health and clinical intervention - Sport and exercise

Stanislava Stoyanova, South-West University "Neofit Rilski", Blagoevgrad - Bulgaria
Nikolay Ivantchev, South-West University "Neofit Rilski", Blagoevgrad – Bulgaria

Cognitive processes are important for successful practicing of sport. Some national and regional competitors in different kinds of sport were studied in Bulgaria by means of Vienna Test system and several questionnaires. The study was conducted in two Bulgarian universities among sportsmen from different sports clubs. The results indicated that there were some significant differences between the sportsmen practicing different kinds of sport in their cognitive processes. The specificity of the practiced sport was related to advance in some cognitive functions like biathlonists’ wider peripheral perception, footballers’ fast decision regarding surface areas, etc.
The purpose of this work was to analyze the relationship between involuntary job loss, general health of the unemployed and their job-search activism, as well as to determine factors of activism in looking for a new job. Using the network of National Unemployment Services, a test battery was administered to the representative sample of 222 unemployed individuals in Serbia (aged 26 to 59). It was found that the relationship between unemployment duration and five general health measures approximates a positive cubic function with a decrement in all symptoms of ill health after the 28th month of unemployment, including an increase of these symptoms after four years of joblessness. On the other hand, job-search activism follows a sine mathematical function with its peak during the first 28 months of unemployment and monotonically declines in the months that follow. Also, SEM revealed a satisfactory fit to the model of Activism with general health, level of education, financial pressure, work centrality and optimism as its main predictors (S-Bχ2 (397, N=222)=611.94, p<.001; RMSEA=.05; CFI=.92). It was concluded that involuntary job loss curvilinearly decreases general health and job-search activism of the unemployed, as well as that activism in searching for a job can be predicted by several factors. Authors consider these results to be in line with previous findings indicating the detrimental effect of long-term unemployment on the health of the unemployed and their activism in finding another job.
There two precursors of this paradigm in Russia: the first N. Danylevsky's (1822-1885) idea of the “cultural-historical types” advanced in the philosophical work “Russia and Europe” (1867). The essence and practical benefit of conception: every nation is a unique psychological type, which manifest in activity: cultural, political, religious and economical. (By the way, for unknown reasons – for me, of cause – the priority in this area arrogates to Vygotsky). The second – unjustly forgotten work of I. Pavlov – the public lecture “Russian intellect” (1918), which firstly published in 1989. There are four main ideas of Pavlov's conception opposite to Vygotsky: (1) culture is not preceded the higher psychical functions, in particular intellect (as archetype) – primary factor, guiding both the historical path of the nation and originality of culture; (2) Intellect – expression of the “etos” of the every nation; (3) Russian “intelligentsia” is a unique psychological type and social group; (4) “And the last, but not the least”: the combination of the qualitative methods not only the psychology, but also the literature and philosophy is the only way to study and understand the national “cultural-historical type”. The monopoly is very harmful in every sphere of human activity, especially in science. We propose, that this work will be useful in the theoretical discussions on the issues: correlation between innate and acquired, the origin of national character, art and religion.
O1890
THE EFFECT OF SOCIAL-COGNITIVE CATEGORIZATION ON IMPLICIT AND EXPLICIT EMPATHY

C05. Culture and society - Group processes and intergroup relations

Javad Hatami, University of Tehran, Tehran - Iran
Pegah Nejat, Shahid Beheshti University, Tehran - Iran
Azadeh Karamali, University of Tehran, Tehran - Iran

The present study was conducted with the purpose of examining the impact of social-cognitive categorization on empathy. Participants were 104 female university students. They were randomly assigned to four equal-sized groups and asked to read scenarios in which a story character became damaged for some reason. The victims were different with regard to ingroup-outgroup membership (Iranian vs. Arab) and morality (guilty vs. innocent). Participants’ explicit and implicit types of empathy toward the victim were assessed using questions and Implicit Association Test respectively. Results indicate that empathy was higher when the victim was either an ingroup member or perceived as innocent. Further, only when the damaged character was an ingroup (and not an outgroup) member, his innocence increased the level of empathy he received from respondents. These effects were more pronounced on implicit, affective and motor empathy compared with cognitive empathy. Keywords: empathy; IAT; social categorization; social cognition.
INTIMATE PARTNER VIOLENCE AND TRADITIONAL IDEOLOGY IN MEXICAN WOMEN AND MEN

C03. Culture and society - Sex and gender

Yessica Cienfuegos, Universidad de Guanajuato, Guanajuato – Mexico
Daniel Ávalos, Universidad de Guanajuato, Guanajuato - Mexico

Intimate Partner Violence [IPV], one of the types of violence, is characterized by being directed against the person with whom one has or had an intimate link. Cienfuegos Martínez (2010) and Trujano, Martínez & Benítez (2002) define violence as any active or passive behavior which harms or has and intention to harm, hurt or control a person whom we have or had an intimate relationship. In general, for all types of violence, intentionality is a core issue. Traditional ideology about cultural roles for men and women, bias on sexual freedom, honor culture, and familism are some of the issues than promote violence in partner relationships. Culture, partner interaction and individual decisions have a reciprocal relationship. Sample was composed by 106 men and 125 women in Guanajuato, Mexico; the mean age in sample was 25 year old. Two scales was applied: Intimate Partner Violence Scale (Cienfuegos, 2010) and Values (Díaz 2013). The last one evaluate traditional ideology, have items as issues "Have a homosexual son is shameful" or “Contraception is immoral”. there is a positive correlation between traditional ideology and high frequency of to be intimate violence receptor. Women and men report similar rates of violence reception, in some factors men report higher levels. In conclusion, women and men can be receptors of violence by their partner, traditional ideology rises the violence acceptance, but it affect on different forms to women and men in a partner relationship.

**BREAST CANCER ONLINE: EFFETS OF USING INFORMATION AND COMMUNICATION TECHNOLOGIES**

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Marie-Jo Brennstuhl, University of Lorraine, Metz - France
Pauline Audinet, University of Lorraine, Metz - France
Cyril Tarquinio, University of Lorraine, Metz - France

Aims: We want to know the effects of virtual exchanges places, on psychological adaptation of women patients to cancer pathology, and especially breast cancer. Procedure: A literature review was made. Databases Cairn, Wiley Online Library, Taylor and Francis, ScienceDirect Journal of Medical Internet Research (JMIR), Communication organisation, PubMed Central NCBI, APA PsycNET, EBSCOHost, Cross Ref, Oxford Journals, Persee, and Link Springer were explored. We included all quantitative and qualitative studies on the use of technologies and online resources related to cancer, especially breast cancer. Results: 52 articles were selected. 30 only included women with breast cancer and 11 included different types of cancer (breast, prostate, kidney, leucemia…). Most of studies have reported significant results in terms of psychological adaptation: improved emotional, psychological and general well-being; a decrease in anxiety and stress; a greater optimism; a better quality of life and a better participation in health. Conclusion: Results suggest a positive relationship between spaces of exchange for women patients and outcomes related to their experiences in relation to the disease. Keywords: Breast Cancer – Online communication – Patients – Exchanges - Interne
Psychoneuroimmunology is the interdisciplinary area of research examining interactions between brain, behaviour and the immune system. According to Jerne, the immune network constitutes the identity of the organism at the molecular level. Similarly, as suggested by more recent developments in neuroscience neural networks of the brain can be viewed as constituting a neuromatrix, representing the physiological “self” of the organism (Melzack R). Being at cellular, physiological or consciousness level, self-identity lays on memories encoded in neural pathways. What if a distortion happens during such neuronal information processing due to improper emotional activation? Can we consider such event a “trauma”? If neuropeptides constitute the common pathway linking emotions and organic body, can such informational trauma affect one’s self-identity’s perception? On the other hand, the study of the epigenetic processes is providing a bridge between the psychosocial world and the biological and the communication between central nervous system and immune system turns to be crucial in self vs non-self differentiation (Mathews H, Janusek L., Meneghetti A.). Such topic will be discussed, supported by current contribution on cellular identity and one’s self-identity’s perception.
TRUST IS IN THE EYE OF EMPLOYEE: STRUCTURE AND FUNCTIONS OF ORGANIZATIONAL TRUST IN EMPLOYEES’ NOTIONS

Marina Zavartseva, Lomonosov Moscow State University, Moscow - Russian Federation

This study investigated structural components and functions of organizational trust according to employees’ notions. The combination of direct (R.B.Shaw’s trust assessment survey) and indirect (the semantic differential scale; the checklist of trust structural components) methods was used. The study evolves statements of the theory of trust by R.J.Lewicki, D.J.McAllister & R.J.Bies (1998) by outlining the role of relationship aspect as a basis for revealing the interdependence of trust’s structural components. This study indicated that the direction in trust relationship between employee and organization differs in groups with opposite estimation of trust’s level in organization: employees with high level of trust tend to perceive the organization principally as a subject of relationship, i.e. “trustor”; in the group of low trust level the organization is perceived as an object, i.e. “trustee”. Study provides evidence that high level of organizational trust has a specific function – the function of organization’s idealization in the notions of employees. Collected data on the sample of 378 employees of different organizations (commercial, medical, educational) shows steadiness of notions of organizational trust between two culturally different samples (one in Russia and another in Uzbekistan). Obtained data provide basis for express-diagnostic of trust in organization and might be used for design of psychological training aiming high organization’s efficacy.
O1901
EMOTIONAL ASPECTS OF INFORMATION PERCEPTION: AN EXPERIMENTAL CONTRIBUTION ON NEGATIVITY BIAS CONDITIONING

A11. General issues and basic processes - Motivation and emotion
Marina Capasso, Sapienza University of Rome, Rome - Italy

Background: negative information fatally attract people’s attention more than positive information, suggesting the existence of an asymmetry in the way emotional contents are processed (negativity bias). Is processing and emotional perception of information related to a specific predisposition set within the subject? Aim: to assess differences in subjects’ perception of emotional contents and to evaluate if such differences could be related to a specific subject inner predisposition. Methods: 40 subjects were included in the analysis. Overall, 6 contents of various emotional value were administered in written (n=3, W) and audiovisual (n=3, A) format. According to the order of format presentation, we identified Group A (n=20; first W, then A contents) and Group B (n=20; first A, then W contents). Osgood semantic differential and Kulikov scale were used to assess subjects’ content perception and dominant emotional state, respectively. Results/Conclusions: we found that the same negative content was perceived worse by subjects not previously exposed to other negative contents (5.6 vs 4.3 and 6.2 vs 5.5 [mean level of negativity perceived for 1st vs 2nd content] in Group 1 vs 2, respectively; p<0.005), independently from its format. Such difference was not observed for positive and neutral contents. An asymmetry between negative and positive content processing does exist. Information hit the subject where he is already emotionally structured by ancient memories, reactivating them.
TREATING PHANTOM BREAST SYNDROME WITH EMDR: A PILOT STUDY

Background: The aim of this research was to challenge the use of EMDR - Eye Movement Desensitization and Reprocessing - therapy in the treatment of the phantom breast syndrome. Methods: Thirteen patients agreed to participate in this study and were treated by EMDR therapy, focusing on two target types: traumatic events related to disease experience and phantom breast sensation. Quantitative evaluations were conducted before the first session, just after the last session and as a follow-up three and six months after. Intensity of the pain and intensity of the sensation were measured, as well as Post-Traumatic Stress Disorder, anxiety and depression. Findings: Results show significant effectiveness of EMDR therapy on all quantitative measures, but also show that EMDR approach can be an encouraging, non-invasive and relatively short strategy. Discussion: While these results need to be completed by other studies covering a larger population and the use of a control group, they are still encouraging because they suggest that a psychological treatment based on EMDR techniques and adapted to the specificity of phantom breast syndrome could be effective in bringing relief to patients.
FATTY ACID STATUS AND COGNITIVE/BEHAVIORAL SYMPTOMS IN CHILDREN WITH ATTENTION DEFICIT HYPERACTIVITY DISORDER (ADHD): DATA FROM AN ITALIAN STUDY

Objectives: As part of a larger randomized, intervention trial investigating the effect of docosahexaenoic acid (DHA) in reducing symptoms in children with ADHD, this study aims to investigate whether a relationship exists between circulating concentrations of FAs and clinical (behavioral and cognitive) measures of ADHD difficulties in an Italian sample. Methods: 51 children with ADHD and 22 typically developing children aged 7 to 14 years were presented with six cognitive tasks from the Amsterdam Neuropsychological Tasks (ANT); moreover, parents rated behavioral symptoms using Strength and Difficulties Questionnaire (SDQ), ADHD rating scale IV, Conners’ Rating Scale–R, Children’ Global Assessment Scale, Clinical Global Impression-severity, Child Health Questionnaire (CHQ). A blood sample was taken from all participants for analysis of the blood FA profile. Correlation analysis was performed between the cognitive tasks/behavioral questionnaires and PUFAs parameters. Results: Children with ADHD presented with significantly lower DHA and n-3/n-6 ratio, higher n-6/n3 ratio and arachidonic acid/EPA ratio. There were significant positive correlations between PUFAs level and the response time and number of errors in cognitive tasks (ANT). Moreover, significant correlations were also found between PUFAs, in particular DHA level, and behavioral scales (SDQ and CHQ). Conclusions: These data confirm also in an Italian sample that children with ADHD display abnormal essential fatty acid profiles, suggesting that PUFA deficiency could be one of the multiple etiological factors of ADHD. Abnormalities in fatty acid profile were also significantly correlated with performance on cognitive tasks and with behavioral ratings.
The paper contains comparative analysis of results of testing and self-assessment of Myers-Briggs Type Indicator, Cattell 16PF test and Belbin diagnostic technique on purpose to reveal gender distinctions among 138 Russian middle- and top-managers in their self-identification in professional and personal qualities and behavior. Gender distinctions in the contents and size of divergences between results of testing and self-assessment of personal qualities of participants were found. The analysis of psychological characteristics of male and female managers has revealed no significant differences in the "communicative qualities" and "intellectual qualities" group and has revealed gender differences in the "regulatory qualities" group. The research revealed gender differences in the preference of team roles and actual behavior during team interaction, moreover between ideal and real behavioral models. At whole the results define the gender differences between male and female managers and can be used to organization their professional development and career promotion. Thus communication skills and interaction skills, general conative qualities and behavioral skills in critical situations, emotional qualities present development zones for male top managers. General conative qualities and behavioral skills in critical situations, planning skills and skills of rational time distribution, emotional qualities, intellectual skills present development zones for female top managers.
INTEGRATING PSYCHOPHYSIOLOGICAL MONITORING AND EMOTION DETECTION IN THE TREATMENT OF PTSD AND STRESS RELATED PSYCHOPATHOLOGY

Yuval Oded, Haifa University, Haifa – Israel

Physiology was neglected in psychotherapy for many years but recent advances in wearable sensor technology and new algorithms for psychophysiological sensing open new ways to understand a client's affective state in real time. Work by Ledoux (1996) emphasizes the special characteristics of the emotional brain. This brain is responsible for emotions and physiology, but often functions separately from the cortex and from cognitive influences. Hence, the physiological component in therapy becomes very important. This is true especially in the case of PTSD and other stress-related psychopathology. In their work on emotional contagion, Levenson and Gottman (1983) proposed that when the autonomic nervous system (ANS) physiology of two people shows “linkage” (i.e., one person’s patterns of activation across the ANS measures mirror those of another person), there is an emotional involvement. Cozolino (2002) describes two components of therapy that optimize neuroplasticity: (1) "A safe and trusting relationship with an attuned therapist". (2) "The maintenance of moderate levels of arousal". Objectives: Based on these findings and on the understanding of emotion regulation processes (Gross, 2003), the presentation will focus on these main points: (1) How exposure to emotion is practiced while using monitoring of psychophysiological measures. Data of psychophysiological responses recorded during exposure therapy will be demonstrated - supporting Porges' Polyvagal theory (Porges, 2011). (2) By using constant multi-channel psychophysiological monitoring the speaker will demonstrate how the information can serve as a beacon lighting the way for psychological intervention. He will discuss ways in which the use real-time psychophysiological monitoring and emotion detection enhances planning of a personal "tailor made" therapeutic intervention, improves therapeutic presence and therapeutic alliance, aids the process of effective psychoeducation, exposure therapy and learning of self-regulating techniques. Conclusions: The unique combination of real-time psychophysiological monitoring with psychotherapy significantly improves therapists' ability to pace the therapeutic process to fit the needs of his clients and in many cases, as will be demonstrated, leads to higher effectiveness of the therapy and to the empowerment of the client. Keywords: Psychophysiology, Psychotherapy, Emotion detection, PTSD, Stress.

LONGITUDINAL RELATIONS OF SES AND CHILD REARING WITH CHILDREN’S EMOTION REGULATION IN ELEMENTARY SCHOOL CHILDREN FROM TURKEY

Asiya Kumru, Ozyegin University, Istanbul - Turkey
Gustavo Carlo, University of Missouri, Columbia - United States
Francisco Palermo, University of Missouri, Columbia - United States
Zehra Gulseven, University of Missouri, Columbia - United States
Bilge Yagmurlu, Koc University, Istanbul - Turkey
Melike Sayil, Hacettepe University, Ankara - Turkey

During the last two decades researchers and theorists on emotional development have highlighted the first years of life as fundamental to emotion regulation (Eisenberg & Fabes, 1992). With regard to its vital role in social functioning, scholars pay more close attention to understand the processes and factors that account for individual differences in the development of emotion regulation and its socialization (Thomson & Meyer, 2007). This study examines the contemporaneous links between SES and responsive and harsh parenting and the longitudinal associations of SES and responsive and strict parenting with children’s emotion regulation among Turkish children. Total of 315 mothers and their children (Mage = 83 months, SD = 3.59) participated. Mothers provided information about their employment status, education level, income at time 1, their childrearing practices at time 3, and their child’s emotion regulation at time 4. Results show that high levels of SES at time 1 decreased strict parenting levels at time 3. In turn, low levels of strict parenting at time 3 enhanced children’s emotion regulation levels at time 4. Additionally, socioeconomic status at time 1 was directly and positively associated with responsive parenting and children’s emotion regulation levels at time 3. Overall, our findings suggest that during middle childhood punitive reactions as well as parents’ economic resources have consistent long term effects in the development of child emotion regulations.

DEVELOPING THE SPECIALTIES IN PORTUGAL: EMPLOYABILITY AND IDENTITY

A01. General issues and basic processes - History of psychology

David Dias Neto, Ordem dos Psicologos Portugueses, Lisbon - Portugal
Telmo Mourinho Baptista, Ordem dos Psicologos Portugueses, Lisbon – Portugal

The specialties of psychology are one of the major areas for professional development and affirmation of our science. The goal of this communication is to present the process of developing the framework for the specialties of psychology in Portugal. We reflect on several models of specialization throughout Europe and the current framework of EFPA in this matter, while considering the contextual characteristics of Portugal that have guided this process. We also describe the discussion process that has guided the development of the specialties and highlight two major themes that have arisen in this discussion: employability and identity concerns. Namely the potential impact of the specialties in the job market and the need to represent particular identities in the specialties framework. We discuss how our current framework for specialization addresses these issues and how this process can contribute to the discussion of the specialties of psychology in Europe.

PORTRAYING MENTAL HEALTH AND ITS TREATMENT IN THE WRITTEN MEDIA

C08. Culture and society - Prejudice and social exclusion

David Dias Neto, Instituto Piaget, Almada - Portugal
Sónia Campos, Instituto Piaget, Almada - Portugal
Patrícia Tavares, Instituto Piaget, Almada - Portugal

The way written media portrays mental health and related treatments is an indicator of the social representation of these phenomena. Furthermore, since the media can be used to reduce stigma and provide information, knowing their current understanding of mental health can constitute a starting point for this awareness. In the present study we aimed at analyzing two major Portuguese newspapers to find whether mental health and related treatments are being positively portrayed and whether this representation has been changing over the years. To achieve this aim we adapted two existing coding systems (Goulden et al., 2011; Stuber&Achterman, n.d.). The news were selected using a set of key words and the news analyzed using the adapted coding system. The time period considered was from 2004 to 2013 and special attention was given to the years prior and after the economic crisis. The results show variation in how mental health and related treatments are represented throughout the research period. These results are discussed with reference to possible factors that may affect the representation of these concepts in written media. We hope to show how the understanding of the social representation of mental health in these contexts is fundamental in reducing stigma.

PSYCHOMETRIC PROPERTIES OF THE EMOTIONAL INTELLIGENCE SCALE FOR CHILDREN

A11. General issues and basic processes - Motivation and emotion

Manuel Sosa Correa, Universidad Autónoma de Yucatán, Mérida – Mexico
Lorenzo Agustín Rodríguez Ake, Caza Sonrisas, Hospital, Mérida - Mexico
Ricardo Castillo Ayuso, Universidad Autónoma de Yucatán, Mérida - Mexico

The main objective of this work is to analyse the psychometric properties of the Emotional Intelligence Scale for Children (EIIE for its spanish name) in a sample of 84 children enrolled in the first year of elementary school in the Mexican education system, all of them from the municipality of Tixpehual in the state of Yucatán, Mexico. The total sample was composed by 50.6 % of males, and had an average global age of 12.75 years, being the minimum age of 11 and the maximum of 15. The internal consistency confiability was verified through statistical analysis; the Crombach's Alfa was 0.712 for the global punctuation. Evidence of convergence validity was found with the ESCQ through a Pearson Correlation between global punctuations (r=0.416, p=0.001), as well as a correlation between the Wellbeing Generation subscale of the EIIE and the TMMS24 (r=254, P= 0.03). In order to verify the predictive capability two models were stated: one to predict the global punctuation of the ESCQ and another to predict the global punctuation of the TMMS 24; EIIE subscales were used as predictors, and in both cases the model worked with one significant variable: the Wellbeing generation subscale. The results found allow us to conclude that the EIIE has an aceptable internal confiability and convergence validity with the ESCQ and the TMMS24, both highly validated instruments in populations of spanish speakers.

NEGATIVITY TOWARD THE RICH AMONG HONG KONG UNEMPLOYED YOUTH: MEDIATING ROLE OF PERCEIVED UPWARD MOBILITY

D06. Work and organization - Labour market, unemployment and flexicurity

Darius Chan, The Chinese University of Hong Kong, Hong Kong - Hong Kong
Grand Cheng, Hong Kong Shue Yan University, Hong Kong - Hong Kong
Winton Au, The Chinese University of Hong Kong, Hong Kong - Hong Kong

Youth unemployment has become increasingly prominent on social agendas worldwide, and Hong Kong is no exception. In this talk, we will present the wave-1 data from an ongoing 2-wave longitudinal study examining antecedents and consequences of employability among Hong Kong unemployed youth. Employability, defined as subjective perception of the possibility of getting employed, has attracted increasing research attention because of its diverse impacts. Here, we hypothesized that less employable youth would perceive lower chance of moving the social hierarchy, which would in turn make them more negative toward the rich. A total of 552 Hong Kong citizens (aged 16 to 27), who had been unemployed for at least 3 months prior to the wave-1 survey held in mid-2014, were recruited to complete our survey. Path analyses were conducted to test our hypotheses and revealed a number of interesting findings, as supported by various model fit indices. Key results include: 1) As hypothesized, employability was positively associated with perceived upward mobility; 2) contrary to our hypothesis, upward mobility was positively associated with negativity toward the rich; those who perceived better chances for moving up the social hierarchy were instead more negative toward the rich; and 3) interestingly, the association between upward mobility and negativity toward the rich was moderated by participants’ education level. Our findings shed light on the societal implications of youth unemployment.

DESIRED FOR INTERNAL CONTROL, AVERSION TO EXTERNAL
CONTROL AND LOCUS OF CONTROL: THEIR IMPACT ON
PSYCHOLOGICAL WELL-BEING

E09. Health and clinical intervention - Positivity and well-being

Presenter: Hezhi Chen, Zhejiang University, Hangzhou - China
Jianhong Ma, Zhejiang University, Hangzhou – China

Locus of control (LOC) has often been implicated in discussions of psychological well-being on the assumption that perceived control is an intrinsic need. However, cultural psychologists suggest control meaning varies cross culture and individual. Burger proposed the concept desire for control, the motivation to obtain an internal control over the environment. Several researches suggest it should be included in study of perceived control, though results are controversial. Here we explored the effect of desire for internal control, aversion to external control and LOC on depression and anxiety. College students from China (N=126) were given the Levenson’s Internal (I), Powerful Others (P) and Chance (C) LOC scales, a modified Levenson’s IPC scales used to measure desire for I control (DI) and aversion to P control (AP) and C control (AC), SCL-90 depression and anxiety subscales. Hierarchical regression results showed that: (1) Low I scores and high DI scores were related to more depression and anxiety. High P scores and C scores were related to more depression. (2) Only an I-DI interaction was found for depression and anxiety. Low I scores predicted more depression and anxiety only for people with high DI scores. High DI scores predicted more depression and anxiety only for people with low I scores. Our findings suggest that lower desire for internal control but not higher acceptance of external control help people lacking of internal control improve psychological well-being.

THE EFFECT OF JUSTIFYING GENDER-RELATED SYSTEM ON JUSTIFICATION OF DOMESTIC VIOLENCE AGAINST TEENAGE GIRLS IN TURKEY

C03. Culture and society - Sex and gender

Özlem Ersan, Middle East Technical University, Ankara - Turkey
Bengi Öner-Özkan, Middle East Technical University, Ankara - Turkey

The principal objective of this study is to demonstrate the social contexts which leads to the legitimization of domestic violence against adolescent girls and the effect of justifying gender-related system on justification of domestic violence against teenage girls among Turkish culture with married people. As measurement tools, Justification of Domestic Violence Against Girls Scale (JDVAGS), Gender-Related System Justification (GSJ) Scale and demographic information form were used. Firstly, 50 participants (25 male, 25 female) completed the semi-structure interviews that are transcribed and content analysed and then anew scale was developed. For the main study there were 307 participants (141 male, 166 female) that completed questionnaire. The age range of the participants was between 22 and 64 (M=41.7; SD= 7.47). Results of the main study indicated that participants who supported gender-related system justification had higher tendency to justify domestic violence against teenage girls. The major contributions of the current study were that main domains are specified related to justification of domestic violence against teenage girls based on Turkish social context, and a new scale was developed referred as Justification of Domestic Violence against Girls Scale, and that the relationship between GSJ and justification of domestic violence against teenage girls with regard to Turkish context was investigated.

ESTABLISHING THE DIAGNOSIS OF MILD HEPATIC ENCEPHALOPATHY: NEUROPSYCHOLOGICAL SCREENING IN CIRRHOSIS

A06. General issues and basic processes - Cognitive neurosciences and neuroimaging

Mary Canellopoulou, Deree - The American College of Greece, Athens - Greece

Minimal hepatic encephalopathy (MHE) is a highly prevalent neuropsychiatric syndrome, characterized by a plethora of cognitive deficits within the spectrum of neurocognitive impairment in Cirrhosis (SO-NIC). In the absence of recognizable clinical symptoms or widely accepted consensus for diagnosis, neuropsychometric measures, especially those suitable for sequential use, would constitute an early diagnostic indicator of subclinical forms of encephalopathy. In the present study, a group of cirrhotic outpatients in Greece (n=68, mean age: 53.9) were compared to a group of healthy controls (n=62, mean age: 52.7), matched for age, sex, education and premorbid intellectual functioning, on a battery of both paper-pencil and computerized neuropsychological tests. Cirrhotic patients demonstrated marked impairment in domains such as attention, short-term memory, executive function, psychomotor abilities and speed of information processing (P<0.05). Cognitive deficits also covaried with the severity of encephalopathy documented by neurophysiological tests (r=0.602, P=0.012) and liver function as indicated by fibrosis (r=0.741, P=0.028). Such findings are consistent with existing literature utilizing a variety of measures and indicate that the observed pattern of impairment is not specific to cirrhosis but suggestive of other organic brain syndromes with frontal-subcortical circuits involvement.

EFFECTIVENESS OF LIFE SKILLS TRAINING ON EMOTIONAL DISORDERS AMONG BOY HIGH SCHOOL STUDENTS

F19. EXPO 2015 Hot Topics - Life skills in culture and society

Mahgol Tavakoli, University of Isfahan, Isfahan – Iran
Maryam Esmaeili, University of Isfahan, Isfahan – Iran

Introduction: Life skills have important role in promoting mental abilities for regulating emotions, self awareness and social adaption in adolescents. The aim of this study was examination of effectiveness life skills training on emotional disorders (anxiety and depression) among boy high school students. Method: the research is semi-pilot and pretest-posttest with a control group. Among all high school boy students 3 schools were chosen randomly. All student of third grade from these school were examined by Depression, Anxiety and Stress Scale (DASS-21). Sixty students from whose that received between 42-84, were selected randomly and they located in experimental group (30) and control group (30). Life skills training program was held in 10 sessions for students in experimental group. Analysis of covariance was used to examine this hypothesis. Results: analysis of experimental group before and after training revealed significant difference in anxiety (F=8/43 and p<0/005) and depression (F=12/56 and p<0/001). Conclusion: According to this study life skills training reduces anxiety and depression in boy high schools students. Key words: anxiety, depression, life skills, adolescence

DISCOURSES AND PRACTICES IN INSTITUTIONALISED NURSING IN SOUTH AFRICA: CHALLENGES FOR CARE

D05. Work and organization - Organizational behaviour

Kate Joyner, Stellenbosch University, Stellenbosch - South Africa
Shefer Tamara, University of the Western Cape, Bellville - South Africa
Estian Smit, University of the Western Cape, Bellville - South Africa

South African nursing remains a largely feminised and devalued profession, further undermined by the popular construction of nurses as indifferent and healthcare systems as hindered by multiple challenges. Over the last twenty years of democracy, various efforts have been made in policy, practice and knowledge production to address the challenges of the primary healthcare sector where nurses are central role players. There are undeniable resource challenges in South Africa which may undermine caring practices; however, this presentation foregrounds the dominant discourses that shape international and local nursing, arguably mitigating against care that is democratic, socially responsive and sensitive to the diverse care needs of communities and individuals. Drawing on Tronto’s political ethics of care and Foucaultian frameworks, the processes currently shaping the experience of nurses and practices of care are analysed. Key themes are the hierarchical, regulatory framework of surveillance in nursing, the dominance of biomedical discourse and the mechanistic framework which fragments nursing practice. These aspects not only disempower nurses and deny them recognition but, together with institutional disregard for the need for self-care, also reproduce a system which is inherently unable to provide humane healthcare.
THE ROLE OF BUSS AND PLOMIN'S TEMPERAMENTAL TRAITS IN RELATIONSHIP BETWEEN EXCLUSION AND AGGRESSION

Being excluded has a lot of negative consequences, but not everyone who feels rejected, behaves aggressively to the same extent. Taking into account that temperamental traits may act as a risk factors in the context of stressful conditions, the study aimed to examine the role of EAS temperamental traits as a possible moderating factors of the relationship between exclusion and aggression. In experiment 1 participants (n = 96) first were excluded or included in Cyberball game and then competed with an another opponent in a Competitive Reaction Time game (measure of displaced aggression). In experiment 2 participants (n = 140) first were rejected or accepted by the ostensible partner of interaction and then evaluated the partner knowing that this assessment would contribute to the decision about partners' future job (direct aggression index). Temperament was assessed with Buss and Plomin’s EAS Temperament Survey measuring emotionality (dissatisfaction, fear, anger), activity, and sociability. The results showed that only emotionality counts in exclusion-aggression link. In study 1 exclusion increased aggression but only in high on trait anger individuals. In experiment 2 participants with high fear and dissatisfaction evaluated the partner more negatively after exclusion than individuals low on these traits. The findings indicated that emotional arousal may play different functions depending on the strength of exclusion and aggression measurement.

EXPLAINING EMPLOYEES’ RESPONSES TO ORGANIZATIONAL CHANGE: A CULTURALLY MODERATED DUAL-ROUTE MODEL

D05. Work and organization - Organizational behaviour

Shyhnan Liou, National Cheng Kung University, Tainan - Taiwan, Province of China

The present research aims to examine the role of Eastern cultural practices in employees’ experiences of major organizational change (OC). We grounded our research in the major organizational reforms of the Industrial Technological Research Institute of Taiwan (ITRI), a world-leading research institute, in 2002 and 2012, as well as the reforms of the Taiwan Public Hospitals system in 2002. We proposed and tested a culturally moderated dual-route model that trust in management mediates the effects of justice in organization on employees’ primary appraisal (i.e., whether the employees perceive the OC as a threat or a challenge), whereas psychological empowerment mediates the effects of work redesign on secondary appraisal (i.e., whether the employees feel competent and resourceful to cope with the OC). More importantly, we investigated the ways in which the cultural practices of Confucian Relationalism in the workplace (i.e., loyalty to supervisors and close overlap between personal and work life among Chinese workers) moderate the relation-based route through trust in management but not the task-based route. These findings shed light on how research exploring Eastern cultural settings can provide a comprehensive understanding of employees’ responses to organizational reforms.

MAN AND EATING, FROM NUTRITION TO GRATIFICATION

F02. EXPO 2015 Hot Topics - Nutrition, development and well-being

Michele Cusano, ASL Foggia 1, University of Foggia, Foggia – Italy

This paper aims to highlight western man’s progressive transition from eating for nutrition to eating for gratification. In particular, this work wants to underline how humans’ relationship with food has gradually changed in industrialized countries over the last few centuries; from being a mean to satisfy hunger, to being a mean of gratification, through flavour, taste and palatal pleasure. In the western world, researching food is no longer driven by the need to feed and survive, but essentially by taste, desire and pleasure. This radically changes the nature and function of the food that people eat, as well as its type and quantity. For this reason, western society moved from the fear of starvation to the fear of excess, from diseases caused by the lack of food to those caused by food abundance, from the idealization of being fat to the idealization of being thin. Food has become a psychic counterbalance, it no longer has anything to do with hunger and starvation and the food that’s available, but instead it appears to be now more than anything related to the psychological dimensions of frustration and gratification and the food we like. The analysis of the outlined process aims to highlight the urgency and the need for psychology to intervene in this matter and to play an important role by proposing attitudes and lifestyles that reduce the centrality of taste and flavour in the life of the western man, whose tendency to develop a severe addiction to taste and palatal pleasure makes him more subject to widespread severe and cronic diseases that undermine his health, serenity and social integration.
RESEARCHERS IN STUDENT ENVIRONMENTS: COMMUTING EXPERIENCES OF COMMUNITY COLLEGE STUDENTS

F21. EXPO 2015 Hot Topics - Environment and sustainability

Valeria Pizzi, LaGuardia Community College, New York - United States
Ronald Moore, LaGuardia Community College, New York - United States
Tomoaki Imamichi, LaGuardia Community College, New York - United States

Existing research on student retention has focused on student attributes and has not given much attention to environmental factors. Environmental factors may play a major role particularly for non-residential or commuter colleges. Researchers in Student Environments (RiSE) explores environmental factors and is involved in a series of studies exploring ways in which students negotiate their commute and ways in which commuting and college experiences can be improved. Surveys with demographic background questions, questions about commute and schools experiences based on ratings scales and open ended questions were administered to 107 community college students from LaGuardia Community College. The data give insight on how various aspects of commuting, such as commuting time, perceived stress, correlate with performance and satisfaction with school, which may impact student retention.
Employee voice behavior has been recognized as a key driver for increasing decision quality and improving organizational or unit functioning. In the present study, we use social identity theory as our framework for exploring whether organizational identification (OI) mediates the link between employee psychological contract violations (PCV) and voice behaviors. Furthermore, this study investigates the moderated mediation and three-way interaction effects that exist in the above relationship. Psychological contract violation, which is an affective state, represents a strong negative emotional experience of an employee who feels betrayed and angry. Social identity research suggests that a strong negative emotional response of individuals in social groups (e.g., organization) is likely to result in self-identity threat (Aquino & Douglas, 2003; Henderson & O’Leary-Kelly, 2012). When individual occurs identity threat, based on the group-value model, people would doubt whether or not they are important members of a certain social group (Tyler, Degoey, & Smith, 1996). The present study suggests that organizational identification would have the mediating effect between perceived psychological contract violation and voice behaviors because organizational identification implies that the individual and the organization are one in the sense that the organization is included in an individual’s self-conception in the workplace (van Knippenberg & Sleebos, 2006), thus a formal employment relationship is necessary to help employee has created the organizational identity. Psychological contract violation is likely to reduce levels of identification with the organization leading individuals to put their interests before those of the organization (Cassar & Briner, 2011; Robinson, 1996), and decrease employee self-worth and self-concept in the organization, this should result in less willingness on the part of the employees to engage in extra-role behaviors which may contribute to the organization (Restubog, Hornsey, Bordia, & Esposo, 2008). In other words, people would be more intrinsically motivated to engage in voice behavior if they identify more with their organization (van Dick, van Knippenberg, Kerschreiter, Hertel, & Wieseke, 2008). Amalgamating the above arguments, we propose: Hypothesis 1. Organizational identification mediates the negative influence of psychological contract violation on voice behaviors. Nevertheless, voice in organization often involves risks and costs for employee. According to social identity theory, the most influential in shaping an employee’s attitudes and behaviors is to compare them with the individual’s informal peer reference (Bamberger & Biron, 2007). Individuals bond themselves to and identify with various work-based referent others within organizational life (Sluss & Ashforth, 2008). People have tended to make social comparisons with those referent and close co-workers to collect information to make decisions before their behaviors (Hogg & Terry, 2000, 2001). When employee unsure adopt which kind of behavior will prompt them engage in social comparisons about which mode of action in response to a given stimulus is appropriate (Bamberger & Biron, 2007). Voice behavior entails risk and subjective uncertainty, promotes an employee’s tendency to make social comparisons precisely with whom the individual most closely identifies, namely the members of their peer referent group (Bamberger & Biron, 2007; Morrison, 2011). After comparing with peer referent group (e.g., work-based colleagues) and
normative inferences, people would make decisions for voice behavior. The decision is in accordance with the beliefs and norms of their work-based referents, to help them construct a more positive self-image. People would avoid behaviors that might be deemed by these others as normatively inconsistent (Bamberger & Biron, 2007; Hackman, 1992). The social comparison process to make voice behaviors decision is similar to “a favorable voice climate” what researchers have referred (Morrison, 2011; Morrison et al., 2011). When others seldom display voice, only those employees who are highly identified with the organization have the motivation to provide the voice. However, they referred voice climate to the group-level concept. In this study, the perception of coworker’s voice behavior is referring to the individual-level concept and may vary between different people. In summary, we propose that: Hypothesis 2. Employee perception of coworker’s voice behaviors moderate the mediating effect of organizational identification on the relationship between psychological contract violation and voice behaviors such the mediating effect is stronger when the perception of coworker’s voice behaviors is lower. Employees who perceived fit with their job positively predicts their job performance (Chi & Pan, 2012). High P-J fit indicates a good match between employees’ knowledge, skills, and abilities as well as the requirements of the job. In other words, the high-performance employees have the ability to provide challenging promotive suggestion for the organization because they can clearly understand how the organization works. Furthermore, job performance is a consequence of feedback-seeking. High job performance could maintain or enhance employees’ self-image and provide them a better understanding of themselves as well as the organization’s expectations (Huang, 2012) to let them have more capability to provide useful voice. If the employees who have worse job performance, they usually are not easy to be trusted by their supervisors or coworkers. We suggest that if they perceive the coworker’s voice behaviors are fewer, they are in a high uncertainty situation. Under these conditions, employees will be less confident to speak up. Only those employees who are highly identified with the organization have the motivation to provide the voice. Thus, we predict: Hypothesis 3. There is a three-way interaction effect of organizational identification, perception of coworker’s voice behaviors, and employee job performance on the relationship between psychological contract violation and voice behaviors, such that the mediating effect is strongest when employee perception of coworker’s voice behaviors and job performance are both lower. Using anonymous questionnaire design, the data were collected from 256 supervisor-subordinate dyadic full-time employees in Taiwan over two time periods. We chose a three-week interval between waves of data collection to minimize common method variance. We asked the subordinates to rate their PCV and PCVB at Time 1, OI at Time 2. The supervisors were asked to evaluate the focal employee’s job performance at Time 1 and voice behaviors at Time 2. All items were translated from English into Traditional Chinese using the back-translation skill (Brislin, 1980). The construct validity of variables in this study was examined through confirmatory factor analysis. We used Mplus 6.11 and the maximum likelihood method of estimation to compare our hypothesized model against more parsimonious models using $\chi^2$ difference tests. We hypothesized 3-factor model for subordinates-rated variables, which includes PCV, OI, and PCVB. The model yielded a good fit to the data ($\chi^2 (101) = 272.22, p < .001$, RMSEA = .08, CFI = .95, TLI = .94, SRMR = .05), and proved superior to three 2-factor models in which we combined PCV and OI ($\Delta\chi^2 (2) = 613.43, p < .001$), PCV and PCVB ($\Delta\chi^2 (2) = 617.02, p < .001$), or OI and PCVB ($\Delta\chi^2 (2) = 1024.78, p < .001$), and a 1-factor model that merged all subordinates-rated variables ($\Delta\chi^2 (3) = 1442.90, p < .001$). We hypothesized 2-factor model for supervisors-rated variables, which includes voice behavior and job performance. The model also yielded a good fit to the data ($\chi^2 (34) = 169.55, p < .001$, CFI = .93, TLI = .91, SRMR = .04), and proved superior to the 1-factor model in which we combined voice behavior and job performance ($\Delta\chi^2 (1) = 334.37, p < .001$). Our model was conducted with Hayes and Preacher’s (2012) SPSSPROCESS macro for testing moderated mediation and three-way interaction effects. Hypothesis 1 predicted that PCV (X) would be related negatively to voice behaviors (Y), and this relationship was fully mediated by OI after controlling employee gender, age, organizational tenure, affect traits, and leader-member exchange quality (indirect effect: $\beta = .15, p < .05$; direct effect of X on Y: $\beta = .08, p = .24$, BC 95% CI of -.06 to .22). Hypothesis 2 predicted that perception of coworker’s voice behaviors at moderate the relationship between OI and voice behaviors. The results indicated that there was a marginal moderating effect of PCVB ($\beta = .07, p<
Hypothesis 3 predicted a three-way interaction effect of OI, PCVB, and employee job performance on voice behaviors. We found the three-way interaction effect was statistically significant ($\beta = .11$, $p<.05$). The results of this study indicate that psychological contract violations decrease employee voice behaviors through their organizational identification, and this mediating effect is stronger when: a) employees perceived their coworkers showing fewer voice behaviors, and b) employees who have lower job performance.

Our findings contribute to the psychological contracts literature in three key ways. First, we use two waves and different source data indicate organizational identification is an important mechanism resulting in psychological contract violations to supervisor-rated voice behaviors. Second, we suggest that the perception of other coworker’s voice behaviors marginal impact the identification mechanism. We introduced the influence of environmental perception what is seldom discussed in the psychological contracts literature. Third, the three-way interaction effect of OI, PCVB, and employee job performance on voice behaviors provides practical implications for leaders to know how to encourage voice behaviors.
THE RELATIONSHIP BETWEEN PERSONALITY META-TRAITS AND FACEBOOK

A14. General issues and basic processes – Personality

Selin Temizel, Middle East Technical University, Ankara – Turkey
Ömer Faruk Şimşek, Istanbul Arel University, Istanbul – Turkey

The Big-Five Model suggests that Extraversion, Neuroticism, Agreeableness, Conscientiousness, and Openness to Experience are major components of personality, empirically extracted from the research on personality structure (Costa & McCrae, 1997). DeYoung et al. (2002) argued that Conscientiousness, Agreeableness, and Neuroticism, which constitute Stability, represented a tendency to have a stable emotional and social functioning; while Plasticity, including Extraversion and Openness to Experience, reflected a tendency to engage with novel situations, suggesting Big-Two model. A recent attempt to provide an explanation for correlations among Big Five, documented a general factor of personality (GFP), namely Big-One, as a combination of positive personality states. The aim of this study is to understand whether personality meta-traits could be observed in data based on multi-informant ratings provided from Facebook (FB) users. The 10-Item Big Five Inventory was administered to 131737 FB users. Findings supported the idea that Neuroticism and Extraversion play a large role in many personality inventories so that Wiggins (1968) called these factors also “Big Two.” Results, however, as the number of informants increase, indicated that Big-One model (15.09, 5: p<.001) is better than Neuroticism-Extraversion factors (27.43, 4: p<.001) and the Big-Two model (13.75, 4: p<.001). This research is the first to investigate personality meta-traits using FB data and multi-informant ratings.
O1985
PARENTING STYLES AND PARENTAL DISCIPLINE AS PREDICTORS OF VICTIMIZATION BY PEERS IN ADOLESCENTS: DIFFERENCES BETWEEN BOYS AND GIRLS

B08. Development and education - Bullying and aggression

Olga Gómez-Ortiz, University of Córdoba, Córdoba – Spain

Most studies that have examined the role of parenting styles in bullying involvement, have focused on direct analysis of this relationship. However, as Darling and Steinberg suggested, are not the parenting styles by themselves but parenting practices that underlie them, which determine the child and adolescent psychosocial development and therefore could be explaining the likelihood to engage in bullying and victimization. The aim of this study was to know whether the parenting styles, directly, or indirectly through discipline practices, can predict victimization by peers. A sample of 2060 Spanish high school students (47.7% girls; M age = 14.34) completed three questionnaires: European Bullying Intervention Project Questionnaire, Scale for the assessment of parenting style of parents of adolescents and Discipline Dimensions Inventory. Different Structural Equation Modeling (SEM) for boys and girls and with the mother and father’s variables of parenting style and discipline were developed. These SEM showed a good fit, confirming the importance of the relationship between parenting styles and discipline practices, and both independent dimensions, as predictors of victimization. The results are discussed, highlighting the importance of affection and communication, psychological control, promotion of autonomy and revelation, as dimensions of parenting style positively or negatively associated with psychological aggression discipline practice, which stands as a clear risk element, directly linked to the situation of victimization in all models.
The aim of our research was to examine subjective effectiveness of Mindfulness-Based Stress Reduction (MBSR) 8-week program using qualitative methods and look more comprehensively to it’s effectiveness. Quantitative studies in clinical samples dominate in MBSR effectiveness research, however, because of it’s particularities it can’t cover whole participants’ experience (Nicholls, 2011). What is more, various MBSR meta-analysis authors encourage to continue program application research, especially in general population (Davis & Hayes, 2012; Bassam et al., 2013). Nine participants, 4 men and 5 women participated in Mindfulness-Based Stress Reduction program, leaded by certified MBSR trainer. They took part in two semi-structured interviews before and after the program. Qualitative data were analysed using across and within case analysis. Four major themes of participant-named changes during the program emerged: work effectiveness (improved concentration, planning skills, self-discipline and productivity), psychological well-being (positive emotions, self-kindness, senses of stability and control, decreased emotional sensitivity), mindfulness (increased self-awareness and acceptance) and reduced levels of stress. These results not only justify MBSR effectiveness, but provide suggestions for future research and show, that stress reduction is only one of many other areas for MBSR application.

CAN HUMANS GENUINELY FORGET THE WORDS THEY LEARNED BY HEART?

A09. General issues and basic processes - Learning and memory

Michail D. Kozlov, Knowledge Media Research Center, Tuebingen – Germany
Veronika Nourkova, Lomonosov Moscow State University, Moscow - Russian Federation
Alena Gofman, Lomonosov Moscow State University, Moscow - Russian Federation

Traditionally research on intentional forgetting looked at the abilities to intentionally not-remember or at failures in learning. In our study we newly demonstrate that participants are capable of genuine intentional forgetting and that the process of forgetting can be supported by “short circuiting“ recall of the original stimulus onto itself. 102 undergrads aged 19-22 had to learn the made up translations of 12 Russian words into a fake Shumerian language. Those 58 students who were capable of perfectly recalling each word pair in a free recall test were invited for a follow-up session. They were presented with the 12 original Russian words paired with onscreen instructions to either “remember” the Shumerian translation, “forget” the translation, continuously “repeat” the Russian word, or do mental arithmetic (control condition). An hour later the participants were given a strong incentive to reproduce all 12 word pairs correctly. Participants recalled significantly fewer “translations” from the “forget” (76% correct) and the “repeat” (74%) conditions then from the “remember” (89%) and the control (85%) condition. Thus it seems that not only are people capable of genuine intentional forgetting, but that in vocabulary learning forgetting can be fostered by strengthening the association of an original word stimulus with itself, a process likely related to Pavlovian extinction.
O1998
ETHNIC IDENTITY AND CONTINGENCIES OF SELF-WORTH IN YOUTH

C07. Culture and society - Race and ethnicity

Aldona Vaičiulienė, Lithuanian University of Educational Sciences, Vilnius – Lithuania

Ethnic identity refers to a feeling of oneself as a member of a group. It develops over time through exploration, learning and commitment to the ethnic group (Phinney & Ong, 2007). The study aims to reveal links between ethnic identity and contingencies of self-worth among Lithuanian youth. Previous studies, when global self-esteem data were obtained by using Rosenberg’s Self-Esteem Scale, didn’t give a homologous answer. Self-esteem require a more detailed study, revealing its different aspects. The Multigroup Ethnic Identity Measure-Revised developed by Phinney and Ong (2007) was applied for measuring ethnic identity in the current study. Contingencies of domain self-esteem were measured by The Contingencies of Self-Worth Scale (Crocker et al., 2003). The authors identified seven domains which contribute to individual’s global self-esteem: approval from others, appearance, competition, academic competence, family support, virtue, and God’s love. The results show a positive ethnic identity association with self-worth among youth. It was found that some contingencies of self-worth lead to a better prediction of ethnic identity. The results contribute to understanding of the reasons for young Lithuanian people to emigrate from the country.
O2003
HELP-SEEKING BARRIERS AFTER SUICIDE OF A CLOSE RELATIVE

E21. Health and clinical intervention - Psychological processes in mental disorders and care

Odeta Geležėlytė, Vilnius University, Vilnius - Lithuania
Vaiva Klimaitė, Vilnius University, Vilnius - Lithuania

Every suicide leaves from 10 to 15 suffering people (Dyregrov, 2009). Suicide survivors suffer from emotional, somatic and social difficulties (McMenamy, Jordan, & Mitchell, 2008; Pitman et al., 2014). As a result, they are often in need of help. However, the main problem is when the bereaved do not seek desirable help from their social network or professionals. Previous studies do not provide clear and broad view of what hinders suicide survivors from seeking for help from their subjective perspective. The purpose of this study is to analyze and describe suicide survivors’ social and professional help-seeking barriers. 23 suicide bereaved (20 female, 3 male, average age 42 y.), who lost their close relative from 1 to 2 years before, were interviewed (average duration 67 min.). Thematic analysis (Boyatzis, 1998; Braun & Clarke, 2006) was used for the data examination. The research revealed that factors, affecting avoidance of seeking for social network members’ and professional help, are associated with suicide survivor himself/herself (state after the loss, attitudes towards help-seeking, self-stigma), survivor’s social network or professionals (inappropriate behavior, poor quality help offered) as well as cultural context. These results suggest that it is important to take into account help-seeking barriers lying in all three levels - individual, survivor’s surroundings and cultural context - when motivating bereaved to seek for help.
Social Skills are acquired through a continuous learning process, but when those mechanisms are missing (as in the case of intellectual disabilities) it is possible to teach them using a specific methodology. Since social ability deficiency is considered a marker of vulnerability to psychopathology, we also tried to let subjects develop the ability to maintain social relations and role learning. Here, we studied two patients affected by severe intellectual disability in comorbidity with behavioral disorders which shown relational and adaptive difficulties. The project was carried out by 2 weekly meetings for a cumulative period of 12 months. The project goals were: (1) To educate subjects to express themselves without invading other’s space; (2) To reeducate inadequate behaviors; (3) To develop self-regulation; (4) To direct teach functional behaviors; (5) Generalization of acquired skills to different life contexts. To obtain the goals mentioned above, we developed structured actions, as: (1) Training for operators and family members; (2) Evaluation of a baseline level through the VABS scale, and 6 and 12 months follow up; (3) Implementation of structured method, during the training phases, based on cognitive-behavioral techniques; (4) Feedback meetings with family members. The training promotes: (1) a better self-control; (2) the learning of adequate behavior; (3) the acquisition of consciousness of own emotions and needs and those of others; (4) the active cooperation in the learning process.

JAPANESE EMPTINESS (MUNASHISA) IN LIFETIME: DIFFERENCE IN TREATING THE FEELING BETWEEN OLDER AGE AND ADOLESCENT

B06. Development and Education - Emotion and self

Maaya Ooue, Tokyo University, Tokyo - Japan

“Emptiness” (Munashisa in Japanese) is felt commonly in Japan, yet there are few studies of what the feeling is, when it arises, whether it changes by age, and other topics. The purpose of this study is to compare the older age’s stance on emptiness or their ways to treat it with those of adolescents. The data taken from semi-structured interviews with 14 people in older stage (7 men, 7 women; age of 62-78) and 13 people in younger stage (7 men, 6 women; age of 20-25) were each analyzed with Constructing Grounded Theory Approach. The result indicates the two generations’ difference in whether or not they act after emptiness arises. Concretely, the feeling lets the older age accept their loss of control in their lives and keep them from new activities. On the other hand, many of younger participants think that emptiness calms them down and motivates them to try new activities. Further studies and analyses will clarify similarities and differences infacing the feeling among various generations in Japan.
O2013

SURVEY OF PSYCHOLOGICAL CHARACTERISTICS OF ADHERENCE TO TREATMENT AMONG CORONARY HEART DISEASE PATIENTS

E16. Health and clinical intervention – Other

Mariia Iakovleva, Saint Petersburg State University, Saint Petersburg - Russian Federation

The research is devoted to the actual in clinical psychology problem of adherence to treatment among patients with chronic diseases. It is an important factor in determining overall healthcare outcomes, also after surgical intervention. Literature shows that adherence among Coronary Heart Disease (CHD) patients after coronary bypass surgery is poor. That is why despite the objective improvement in health state, rates of physical health in some patients decline. A program of a complex research including the study of emotional, cognitive, personality, motivational characteristics of CHD patients was developed. A group of 50 patients (60% adherent and 40% non-adherent) was already examined. The preliminary data analysis showed the following tendencies. Both groups were found to have the desire to show their best, and to be introverts. The study of the predictive value of the characteristics with respect to the degree of adherence revealed that rare use of the coping strategy “positive revaluation” in combination with high figures of the ergopatic attitude towards illness is significantly connected with non-adherent behavior. This study showed that wide range of patients’ psychological characteristics is potentially significant for the definition of compliance. Thus, it may be assumed that psychological methods can be used for its improvement and therefore of patients’ physical well-being, and it is advisable to develop programs of psycho-social rehabilitation for patients.
This study aims to investigate the effect of cue exposure on craving and galvanic skin responses (GSRs) for overweight/obese and normal-weight women. According to the literature, physiological and subjective responses to the food related cues could differ between obese and normal-weight individuals. Hence, it is thought that overweight/obese and normal-weight women would give different responses when they were exposed to the sight and smell of chocolate and their eating styles could have an effect on these responses. The Dutch Eating Behavior Questionnaire (DEBQ), Bulimia Investigatory Test Edinburgh and Demographic Information Form were answered by 321 women. The craving scores and GSRs of 60 (30 overweight/obese, 30 normal-weight) women who got the highest scores on the subscales of the DEBQ were used for the analysis. The results show that participants scored significantly higher on craving after being exposed to the chocolate cues, and their GSRs significantly increased during the exposure than baseline measure. Normal-weight women’s craving scores were significantly higher than overweight/obese women. Overweight/obese women had significantly higher scores on GSRs than normal-weight women when they were exposed to the sight of chocolate. Participants’ craving scores and GRSs did not significantly differ in terms of the eating styles. To sum, this study supports the notion that cue exposure could lead to different responses among overweight/obese and normal-weight women.
THE PSYCHOSOCIAL CAREER COUNSELLING SERVICE (CCPO) AS “OBSERVATORY OF CHANGE”: THE ROLE OF PARENTS IN THE UNIVERSITY CHOICE

Chiara Annovazzi, University of Milan-Bicocca, Milan - Italy

The CCPO was established in 2001 within the Psychology Faculty of the University of Milano-Bicocca in order to reduce the number of university drop-outs. It offers guidance on a wide variety of career concerns and helps students to maintain their career goals and make aware career choices. The theoretical framework refers to the pragmatist and mutual Empowerment construct (Rappaport, 1981; Zimmermann, 1998; Cornish, 2004 & 2006) and the perspective of Life Design (Savickas & al., 2009), focusing on the concrete conditions of existence and on the situated economic and social environment in which the individual is engaged. The user profiles, the questions and the student paths are recorded in a data-base: in that way the Service has a role of “Observatory of change”. The data show an increase of critical issues and a new theme in Italy: the presence of the parents of prospective and current students. In fact, given the current crisis in the world of work and in line with a traditional Italian image of the role of parents, it was noted an increase of the need of parents to direct their children to a safe path. For this reason, we have investigated for the first time in Italy the parents level of resilience, hope and optimism (La.RIOS, 2012), important constructs to cope with the crisis and to build a possible future, in relation to the effects on the university choices of their children. The paper presents preliminary data about parents influence on their university children.
PSYCHOSOCIAL FACTORS THAT INFLUENCE DECISION MAKING AND REALIZATION PROCEDURES OF CADAVERIC ORGAN DONATIONS: A GREEK STUDY

The rates of cadaveric organ donation and transplantation are considered very low worldwide despite the increased need for human organs that exist. Especially Greece holds one of the last positions in the ranking of the European Countries, regarding the number of transplantations carried out. The present study, approaching organ donation not as an isolated action, but as a series of actions which take place into a system of relationships, focuses on decision making procedures and studies the social and psychological factors which confine this procedures. This socio-clinical research approach has been inspired and influenced by hermeneutic theoretical tradition and social representation theory and adopts a qualitative methodological perspective using Grounded Theory to analyze “in depth” interview data. The participants of the study were: 1) members of families who have been asked for donation and 2) health professionals, especially doctors from Intensive Care Units and transplantation coordinators, both groups of people who have the experience of organ donation procedures. The specialized purposes of the study were to analyze the meanings that individuals themselves attribute to their experience, as well as to analyze the relationship between the two groups who have been involved with the organ donation procedures and finally their relationship with the Greek institution of organ donation and transplantation. Analysis indicates that the members of the two groups face similar dilemmas regarding organ donation decision and that organ donation procedures obtain various and especially conflicting meanings. Participants, based on their personal experience, seem to regard organ donation decision, not only as a decision burdened by diverse and crucial dilemmas, but also as an expression of the identity of the person who decides. In addition, analysis indicates that the meanings which participants of the two study groups give to their experience have been influenced by the attitudes and the stereotypes that every group already had for each other and also by the interaction that took place among them during the organ donation procedures.
O2043
EFFECTS OF LEARNERS’ BELIEFS, MOTIVATION, AND COGNITION ON PREPARATORY LEARNING BEHAVIORS

B09. Development and education - Adolescent adjustment
Keita Shinogaya, Nihon University, Tokyo – Japan

This study examined how learners’ beliefs, motivation, and cognition affect their preparatory learning behaviors. 219 Japanese junior high school students (age range: 12-15) were participated in this study. They responded to the questionnaire asked about their beliefs about learning, their motivation, perceived utility and cost for doing preparation, and preparatory learning behaviors (e.g., reading textbook and solving problems beforehand) in mathematic learning. The final model earned by the path analysis (GFI = .983, AGFI = .945, CFI = .992, RMSEA = .042) revealed that learners’ intrinsic motivation directly increased preparatory learning (= .29p< .01). It was also found that intrinsic motivation increased perceived utility (= .45p< .01) and decreased perceived cost related to preparation( =-.17, p< .01). On the contrary, learners’ belief that rote memorizing is more important than meaningful learning had positive influence on perceived cost (= .27, p< .01). Perceived utility positively influenced (= .26, p< .01) and perceived cost negatively influenced (= -.13, p< .05) on learners’ preparatory learning. Preparation is an important activity that enable students to understand the contents of classroom lessons more deeply. The results of this study suggest that intervening to motivation and beliefs about learning can increase preparatory behaviors at home and deepen their understanding contents of daily classroom lessons at school.
IMPACTS OF ATTRIBUTIONAL STYLE AND IMPLICIT THEORY OF INTELLIGENCE ON JOB STRESS AMONG TEACHERS

D04. Work and organization - Well-being at work

Vivienne Y.K. Tao, University of Macau, Macau – Macau
Ka Hou Lam, University of Macau, Macau – Macau
Chi Wo Leung, University of Macau, Macau – Macau
Chit Iam Sun, University of Macau, Macau – Macau

To gain a better understanding of the cognitive causes of teachers’ job stress and satisfaction in the school setting, the roles of teachers’ implicit theory of intelligence and their attribution to students’ academic performance on teachers’ job stress were examined in the current study. There were over 290 teachers of secondary and primary schools participated in the questionnaire survey. Findings showed that the positive relationship between teachers’ ability attribution to students’ academic failure and job stress was fully mediated by their entity theory of intelligence. Results suggested that teachers who attribute students’ academic failure to students’ inability are more susceptible to job stress and less satisfied with their jobs when they view intelligence as a fixed and unchangeable entity. Accordingly, interventions for stress reduction among teachers in school setting are discussed.
O2050
A COMPARE OF ADHD AND LD IN CLINICAL AND NON-CLINICAL SAMPLES BY WISC-IV

A12. General issues and basic processes - Intelligence and cognitive functioning

Hilal Kaya, Ankara University, Ankara - Turkey
Gulsen Erden, Ankara University, Ankara - Turkey
Nilhan Sezgin, Ankara University, Ankara - Turkey
Tuba Gumussoy, Ankara University, Ankara - Turkey

There is a growing body of intelligence in terms of cognitive process such as perception, memory, creativity, problem solving and reasoning. Psychological scales that are used to assess the intelligence are also been vital to evaluate psychological disorders such as ADHD and LD. The main aim of this study is to compare the WISC-IV subtest, index and full-scale scores of three groups of children. The two groups are diagnosed ADHD and LD, the comparison group did not receive any clinical diagnosis. The additional aim is to find out whether there are differences between the WISC-IV profiles of children with ADHD or LD from their peers with normal intelligence and having no psychiatric or neurological symptoms. The groups consist of 13 normal children and 13 children with LD, 13 children with ADHD. The subjects were age between 7-16. All children have completed the WISC-IV. The results of the study suggest that children with ADHD or LD have significantly lower index scores in contrast to comparison group with no clinical diagnosis. While observing significantly different Verbal Comprehension, Working Memory and Processing Speed Index scores for clinical and control groups, no significant difference exists in Perceptual Reasoning Index scores. Findings in the study are consistent with the results of similar works in the international literature. Even though small number of participants in the sample is a limitation of the work. It's expected to serve as a preliminary study for the future research.
Global Recessions such as the Great Recession of 2008-2009 shape the circumstances and prospects of hundreds of millions of people across the globe. These economic shocks exert their power by triggering a massive, instant slowdown of local economies, with long-term consequences for the economic trajectories of regions and the prosperity of the people living there. The knock-on effects can be felt across a wide array of economic, political and social indicators, and have commanded the attention of scholars and policy makers alike. However, the economies of some regions show considerably more resilience to such crises than others do. So what features might allow some regions to maintain their economic vitality in face of recessions while their neighbors succumb? What makes some regions strong, in spite of severe macro-economic fluctuations? Is it purely a good economic infrastructure – or do other “hidden” factors, like the personality of a region, also play a role?

We therefore examine whether macro-psychological factors of regions are able to predict the reaction of local economies to a major global crisis. While prior approaches to understanding economic resilience have focused on regional economic infrastructure, we draw on research highlighting the key role played by psychological factors in individual-level economic behaviors (Tversky & Kahneman, 1974). In particular, we test whether differences in the macro-psychological make-up of regions can help explain localized resilience to economic adversity, over and above the role played by structural economic factors. Specifically, we examine links between regions’ levels of psychological traits and their degree of economic slowdown during the Great Recession of 2008-2009. We assessed economic slowdown by means of changes in the local startup rates during the crisis (between 2007-2009). Start-up rates reflect entrepreneurial activity in a region and perceived current and future opportunities. High start-up rates reflect optimism and opportunity, and low start-up rates indicate pessimism and diminished opportunities. In the regions of two major Western economies, we assess the aggregate levels of the Big Five personality traits plus an entrepreneurial personality profile and we index economic slowdown in terms of changes in the regions’ entrepreneurial vitality. We analyze data from two large psychological datasets from the United States (N=933,312; 366 Metropolitan Statistical Area) and Great Britain (N=417,217; 375 Local Authority Districts). To control for standard economic factors that are usually discussed in the economics literature on resilience, we consider the region’s industry structure, endowment with knowledge (1) human capital assessed via the regional share of the working-age population with a higher education; 2) patents per 1,000,000 capita), financial capital (the region’s employment share in the finance sector), gross domestic product, unemployment, and housing prices. The results reveal a substantial economic slowdown during the crisis. Specifically, the average start-up rate in US regions was relatively stable in the years before the Great Recession reaching a peak of 5.95 per 1,000 employees in 2007 but dropping by 30% to 4.18 in 2009. A similar picture emerged in GB, with start-up rates dropping by 17%, from 11 start-ups per 1,000 employees in 2007 to 9.11 in 2009. However, these general trends masked considerable variation across regions. What
predicts this regional variation? We ran OLS regression using the macro-psychological variables (the region’s average scores of the Big Five traits and of an entrepreneurial Big Five profile) and economics resilience factors as independent variables. We controlled for the region’s population density and the initial level in the local startup rates in 2007 (before the crisis). With regard to the macro-psychological features, the analyses delivered a remarkably consistent picture across the two countries. In both countries, more emotionally stable regions and regions with a more prevalent entrepreneurial personality make-up showed a significantly lower economic slowdown during the crisis. In Great Britain, a higher prevalence of openness had an additional protective effect. In contrast, the traditional economic structural factors such as GDP, knowledge, or industry structure exhibited mixed results. In fact, from all potential resilience factors that we had studied in our analyses, the macro-psychological features delivered the most robust and consistent results. Generally, these findings highlight the value of expanding both traditional research perspectives and public policy foci that currently prioritize the role of economic infrastructure. Instead, future approaches dealing with the reactions and resistance of local economies to macroeconomic shocks should also take into account the characteristic macro-psychological features of regions. The present results indicate that “hidden” factors such as regional personality characteristics matter not only for the region’s economic outcomes in general but also for the region’s economic vitality during a major macroeconomic crisis like the Great Recession of 2008-2009, widely regarded as the worst economic collapse since the Great Depression. Hence, the region’s affectedness by such global crises, and related societal and economic costs, may depend, at least in part, on the region’s cultural make-up and macro-psychological climate. This means that regions may not always react in a rational way in terms of the predictability of their economic performance during major crises. Our results rather indicate that it is not only the “rational effect” of the visible economic infrastructure that matters for economic resilience but also the effect of the more “hidden” macro-psychology of the region.
Alzheimer's disease leads to the loss of cognitive and functional abilities until the patient is completely dependent upon caregivers. High levels of stress often compromise emotional and socio-relational spheres in caregivers until their personalities are “cancelled”. Qualitative method has been used in a group-analitic approach and this study allowed caregivers to give voice to their sufferings and to show their identities, that are often forgotten. The research has been conducted on six caregivers of Alzheimer's patients, taking part in a psychological support group. All subjects were asked ad hoc clinic interview questions and answers have been processed with the “T-LAB” software. This study shows how useful a psychological group can be, starting from the hypothesis that such an experience allows caregivers to repossess their personal identities. Indeed, the group represents a protected space where participants can share information and advice on how to look after and manage their relatives affected by Alzheimer's disease. But above all, psychological group is a place where thinking about oneself as an individual -and not only as a caregiver- becomes possible.

CAN WE HONESTLY COMMUNICATING FALSE INFORMATION WITHOUT MISLEADING THE LISTENER?

A10. General issues and basic processes - Language and communication

Sophie Henry, University of Paris 8, Saint-Denis - France
Marcel Bromberg, University of Paris 8, Saint-Denis - France

According to the principle of relevance (Sperber & Wilson, 1995), if in an exchange, a person requests the time, the other answer approximated (9:30 to 9:26), whatever the type of watch (analog/digital). The key for the speaker is to ensure that the listener is representation of thought communicated relevant enough to be treated with the minimum of effort. Extending the work of Van der Henst Carles & Sperber (2002), the research aims to clarify here the contexts in which a literally false statement communicates information with maximum relevance. We assume that the probability of giving a rounded time will be higher in a social context without desired precision (café) than not (station), regardless of the type of watch of the respondent. The experimenter asked the time to 943 men and women, with a digital or analog watch, in a station vs café, justifying his request or not: "because my watch has stopped". The results show that it is in the station, or café with a justification, of the request that people give a more precise answer. But contrary to our expectation, people with a digital watch give a more precise time. Our goal was to control the sexe of subjects assuming no a priori differences. However, women give more precise hour provided justification and especially on the café. We will make interpretations in terms of stereotypes. Thus, under the principle of relevance, express his thoughts literally is not always the best way to communicate with the maximum relevance.
O2088
THE RELATIONSHIP OF AMBIVALENT SEXISM AND RELIGIOUS ORIENTATION TO TURKISH MEN AND WOMEN’S HONOR BELIEFS

Suzan Ceylan, Middle East Technical University, Ankara - Turkey
Nuray Sakallı Uğurlu, Middle East Technical University, Ankara - Turkey
Peter Glick, Lawrence University, Appleton - United States
Gülçin Akbaş, Middle East Technical University, Ankara - Turkey
İrem Metin Orta, Atılım University, Ankara - Turkey

We explored how religiosity and ambivalent sexism differentially relate to Turkish women and men’s honor beliefs. In “honor cultures” such as Turkey (Nisbett& Cohen, 1996), honor codes specify virtuous behavior in highly gender-specific ways that support male power and female subordination (e.g., Vandelio& Cohen, 2003), including violence against “disobedient” women (Sev’er& Yurdakul, 2001). We sought to understand what might lead Turkish women to accept honor beliefs that disadvantage themselves and their gender. To this end, Turkish participants (460 women, 188 men) completed the Ambivalent Sexism Inventory, Religious Orientation Scale, and Honor Endorsement Index. Regression analyses revealed that religiosity and ambivalent sexism predict honor belief endorsement for both men and women; but gender moderated how sexism related to honor beliefs. Specifically, women’s honor beliefs were better predicted by benevolent sexism, whereas men’s honor beliefs were better predicted by hostile sexism. We suggest that benevolent sexism plays a particularly important role in women’s willingness to endorse honor beliefs by providing a subjectively positive image of and promised rewards for women who accept a subordinate role to men. Therefore, efforts to combat honor codes might do well to address reducing women’s adherence to benevolent sexism (e.g., through increased economic opportunities) and by campaigning within religious organizations to ameliorate or reinterpret sexist teachings.
O2091
ORGANIZATIONAL CONTEXT OF PROFESSIONAL DEVELOPMENT

D05. Work and organization - Organizational behaviour

Sergey Manichev, Saint Petersburg State University, Saint Petersburg - Russian Federation
Evgeniy Astapenko, Saint Petersburg State University, Saint Petersburg - Russian Federation

The main goal of research was to develop a theoretical ecology model of professional development (Mumford et al., 1990) and build an empirical model, that links together the organizational context (including the organizational discourse) of professional development, the requirements to the employee and interactive processes (management techniques, participation, knowledge sharing) as tools for coping with the working situation. The connection between the structural characteristics of organizations and organizational options of discourse was analyzed. It was shown that the characteristics of organizational discourse (issue-related and partly genre characteristics) are associated with the level of professional development of the staff (first study among 232 employees). Structural empirical model of professional development was built (second study among 282 employees) linking the success of coping (career steps), the actual working situation (organizational conditions, the stiffness of the requirements) with the structure of organizational interactions. Organizational interactions themselves are in certain relations between them: management techniques determine the capability or incapability of wide involvement of employees in organizational activities (participation), the width of participation as interaction beyond the scope of narrow work roles, in turn, is prerequisite to ability of knowledge sharing in organization.
DEVELOPMENT OF WEBBASED PSYCHOTECHNOLOGIES FOR CP-RELATED LIFE LONG LEARNING-SYSTEM

F10. EXPO 2015 Hot Topics - Psychotechnologies and life-long learning

Katrine Jorgensen, University of Copenhagen, Copenhagen – Denmark

In this project, our task was to develop a web-based life-long product-concept for people with cerebral palsey (CP) and their parents. The concept was to address the need of parent support and enhance the ability of coping in connecting with transitions fases in life. Earlier studies point out these two aspects as important focus areas. To unfold these two aspects we used semi-structured interviews with open-ended questions. We interviewed parents to children age 22 month to 16 years and young grownups with CP. Our findings matched results from earlier studies concerning indication of abnormal level of stress in parents and the specific periods where the level of stress rises. Furthermore, the results from the interviews gave us a hypothesis about what sort of content the webbased psychoteknologi need, when it’s needed and in which form it could be presented. Further studies must evaluate this. Our small sample reduces the reliability of the findings, on the other hand does the supporting results from earlier studies enhanced the reliability. Altogether, it gives us a reliable and important input for the development of the product.
MENTALIZATION AND OVERWEIGHT - HOW FAR GOES THE INFLUENCE OF MATERNAL REFLECTIVE FUNCTIONING?

Anja Keitel-Korndörfer, University Leipzig, Leipzig – Germany
Verena Wendt, University Leipzig, Leipzig – Germany
Annette M. Klein, University Leipzig, Leipzig – Germany
Kai von Klitzing, University Leipzig, Leipzig – Germany

Introduction: Parental overweight has been identified as an elementary risk factor for childhood overweight (Agras et al., 2004). Besides biological factors, parental behavior and familial interactions may influence children’s eating behavior and weight development. In the context of familial interactions, recent research (Fonagy et al., 2003) showed that a lack of mother’s reflective functioning (RF) results in deficits in emotion regulation of the child. Those deficits might be a possible predictor for compensatory eating behavior like emotional eating and, in consequence, for childhood obesity. Method: By analyzing data from 60 mothers (30 normal weight; 30 overweight) and their children, 1;6 to 4;11 years old, we (a) compared the quality of mother’s reflective functioning (measured with the AAI-RF, Fonagy et al., 1998) between obese and normal weight mothers and (b) explored whether the eating style or the weight of the child were influenced by mother’s reflective functioning. Results and Discussion: Compared to normal weight mothers, obese mothers did not show a different RF. Further, RF neither had an influence on child’s emotional eating nor on child’s weight. However, results show that emotional eating of the mother mediates between RF and her own BMI group. The role of RF in the context of overweight will be discussed.
The aim of the present study is to estimate the interaction effect of personality dimensions (i.e., extraversion, conscientiousness, agreeableness, neuroticism, openness to experience, negative valance) and relational self-regulation (RSR) on political participation about Occupy Gezi which occurred in Turkey. Since millions of people participated to protests, it is important to understand relational perspective behind Occupy Gezi. Data was collected from 419 (%71.1) female and 170 (%28.9) male, a total of 589 participants. An online web-based questionnaire was used for data collection. Moderation analysis results showed significant interaction effects of personality dimensions and RSR, and also their direct effects on political participation. The interaction effects of agreeableness, openness to experience and neuroticism with relational self-regulation on political participation were significant. The direct effects of extraversion and RSR on political participation were also significant. Since out of six moderations, only three of them were significant; it can be concluded that people participated in Gezi Protests did not only showed participation based on their relational decisions.
The present research intended to study the motivation in couples and among genders. In the approach to motivation many perspectives were developed, some pointing the person as the centre of his/her own motivation, others focused on external rewards and their role (Mayer, Faber & Xu, 2007), previewing of the current concepts of intrinsic and extrinsic motivation. Our work takes into account Deci and Ryan’s Self Determination Theory (SDT) (1985, 2000, 2008; Ryan & Deci, 2000), that support the existence of different types of motivation. To assess motivation in couples we used MS - Motivation Scale (Rempel, Holmes & Zanna, 1985; Portuguese version by Abreu-Afonso & Leal (in press). Our sample was composed by 185 heterosexual couples. The results confirm the existence of small, but important, differences when comparing genders and motivation styles. By comparing each gender with the different motives, we concluded that intrinsic motives, personal and perceived, presented a higher importance, especially in women. In other hand, extrinsic motives appear to play an irrelevant role in both genders. When comparing genders, only men were significant influenced by perceived motives, either extrinsic or intrinsic. This research collects valuable information to understand couples dynamics when working with couples seeking for clinical help.
Emotional disorders like anxiety disorders, mental depression or neurasthenia are treated in western medicine as isolated psychic disorders. Chinese medicine is a holistic system and a kind of psychosomatic medicine in itself because the emotions are stored in the inner organs. Harmony between Yin and Yang, the flow of Qi and the relation between the five Yin-organs means physical and psychic health, whereas disharmony may bring about diseases and mental problems. Mental diseases in terms of Chinese medicine are mostly associated with the kidney, the liver and the heart. The correct diagnosis of the patient’s disharmony pattern may give us an insight into his metabolic situation on the level of the bowels as well as on the neuroendocrine level because in many cases we may reinterpret the Chinese pattern in terms of western medicine. For treatment we have to prescribe individual recipes for herbs and acupuncture. Conclusion: Acupuncture and combined Chinese herbal medicine are a good support of western medicine in the treatment of mental diseases. For acupuncture we use acupoints according to the disharmony pattern and combine these with those with definite mental effects (Pc 6, Pc 7, Yingtang, St 36, Sp 6). Clinical studies proved that Chinese herbal treatment and acupuncture may show good results in the treatment of mental disturbances such as anxiety disorders and mental depression in less severe cases.
THE EFFECTS OF ADAPTIVE AND MALADAPTIVE HUMOR STYLES ON DEPRESSION AND ANXIETY IN A TURKISH SAMPLE

Kerim Selvi, Middle East Technical University, Ankara – Turkey

The aim of current study was to examine the effects of humor styles (i.e., adaptive and maladaptive) on depression and anxiety. While adaptive humor styles were categorized as affiliative and self-enhancing humors, maladaptive ones were categorized as aggressive and self-defeating humors. For this aim, data was collected from 164 college students via questionnaires. After that, two separate sequential regression analyses were conducted for depression and anxiety. In each analysis, the effects of age and gender had been eliminated, and then the effects of humor styles were tested. Results indicated that affiliative and self-enhancing humor styles predict depression significantly and negatively. Moreover, it was found that self-defeating humor predicts depression significantly and positively. In terms of anxiety, although affiliative humor predicts anxiety negatively and significantly, self-defeating predicts anxiety positively and significantly. These results can be interpreted as affiliative and self-enhancing humors are protective factors for depression while self-enhancing humor is a risk factor for depression. In terms of anxiety, affiliative humor also is a protective factor, while self-defeating humor is a risk factor. In other words, while affiliative, self-enhancing styles are signs of well-beings, self-defeating one is threat to well-being.
O2124
ON THE SWING OF CAREERISM AND UNIONISM: A VALUES AND SELF PERSPECTIVE

C06. Culture and society - Attitudes and values

Özge Kantaş, Ankara University, Ankara – Turkey

This study investigated the value-portraits of careerism and unionism among university students as prospective labor force and its relationship with their self-construal. Both quantitative and qualitative methods were employed for data collection (such as Schwartz Portrait Values Questionnaire, Careerist Orientation Scale, Balanced Integration Differentiation Scale, items from Union Image Survey, Belief in Unionism Subscale; and related open ended questions were formulated to elaborate answers) Accordingly, how the undergraduates’ values and self’s are associated with their anti and pro attitudes towards labor unions and towards career advancement through non-performance-based means were analyzed and found to be differential to some extent while some similarities may be hold. For instance, benevolence value discriminated careerists from unionists for motivation of social relations; that is, careerism may emphasize social relationships with peers and colleagues not only for affiliation and relatedness needs (as unionism do), but because these people can be instrumental as informal business contacts and promote oneself. Although careerism and unionism have been studied in different contexts with some attitude measures (e.g., job satisfaction, commitment, and involvement, willingness to join or voting for a union, and union apathy) to my knowledge, it was the first time that careerism and unionism were investigated under the theoretical framework of values and self-orientations.
O2129
TECHNOLOGIES IN THE WORK OF PSYCHOLOGISTS AND THEIR CLIENTS: WILL THEIR HORIZONS CONVERGE?

D05. Work and organization - Organizational behaviour

Valentina Podshyvakina, Odesa National Shevchenko University, Odesa – Ukraine

Radion Svynarenko, University of Kentucky, Lexington - United States

State of the Art and Purpose: The article focuses on the process of adaptation of the new research tool to examine the ethical differences of human capital development between transition and developed economies, in information systems. The goal of the study is to test the differences concerning the relation of organizational citizenship behaviors (OCB) between transition and developed economies, on the example of Poland and Germany. Design/Methodology: The qualitative and quantitative methods were used during the process of translation, adaptation, validation and reliability verification of the new tool and the research hypotheses testing. The structured online survey comprised adapted questionnaires in Polish and German studies: Employee Behavior Questionnaire (EBQ). The studies are based on two random samples of 60 IT users in Poland and in Germany. Results: The new tool was elaborated in Polish and English languages. The differences of OCB of IT Users were examined between countries, with consideration of the socio-economic features of transition and developed economies. Limitations: Studies should be continued in other transition and developed countries for more numerous research samples, in various branches of the economies. Research/Practical Implications: The conclusions of our research can be addressed to IT Users and professionals, especially HR staff in transition and developed economies. Analyzing the differences of OCB and popularizing ethical ideas in mentioned above economies can be a factor of human and economic development that increase efficiency and commitment. Originality/Value: The study fill a gap in the field of socio-economic IS development research with new tool concerning ethical attitudes - OCB components. The cultural differences between transition and developed countries were indicated in the field of the factors of OCB increasing, first time together in Poland and in Germany. Keywords: developed economy, differences, IT Users, Organizational Citizenship Behaviors (OCB), Poland, transition economy, Germany.
O2139
THE LAY-PEOPLE PERCEPTION OF FINANCIAL EXPERTS’ EPISTEMIC AUTHORITY

A12. General issues and basic processes - Intelligence and cognitive functioning

Renata A. Maksymiuk, Maria Curie-Sklodowska University, Lublin - Poland
Tomasz Zaleskiewicz, University of Social Sciences and Humanities, Wrocław - Poland
Agata Gasiorowska, University of Social Sciences and Humanities, Wrocław - Poland
Yoram Bar-Tal, Tel Aviv University, Tel Aviv - Israel
Katarzyna Stasiuk, Maria Curie-Sklodowska University, Lublin - Poland

The goal of this project was to study how lay people perceive epistemic authority (EA) in the field of financial expertise. EA is defined as the extent, to which individuals treat a source of information as an evidence for their judgment independently of the objective level of such expertise, but relying on superficial premises (Kruglanski, 2012). Recent studies in health psychology demonstrated that patients attributed higher EA to physicians who recommended an active treatment over those who advised against it (Barnoy et al., 2012; Bar-Tal et al., 2013). However, previous research in political domain (Raviv et al., 1993) showed that client’s opinion interacted with expert recommendation: Expert EA was evaluated as higher when it was the same as client’s opinion (confirmation bias). This was due to the fact that bestowing high EA to someone with similar opinions might be the way of asserting own self-worth as a source of knowledge. For that reason we expected that financial advice confirming consumer’s opinion would lead to assigning higher EA to the advisor. We conducted three experiments, in which we manipulated the type of recommendation and measured or manipulated clients’ opinion on the financial product (loan, investment, life insurance). The results revealed that more active (compared to passive) recommendations led to bestowing higher EA to the advisor, but only when the client’s opinion on the product was positive. In case of the negative opinion, the pattern reversed.
Families feel more strengthened and resourceful when existing strengths and skills are utilized providing a safe and supportive environment and appropriate learning opportunities for children and all family members, which also enhance confidence and self-esteem (Walsh, 2006). The Strengthening Families Program (SFP), tested in this study, is an evidence based family program designed to increase resilience and reduce risk factors for behavioral, emotional and social problems in families (Kumpfer, Xie, & O’Driscoll, 2012). The results on 21 outcomes were analysed using SFP 6-11 Years data (n=41) with Portuguese families (measured with the standardized SFP instrument) compared with SFP 6-11 Years international norms, with a quasi-experimental 2-repeated measures (pre-to posttest) by 2-group design. Statistically significant positive results (p<.05) were found for 76.2% of the 21 outcomes measured for Portuguese families, and 100% of the 21 outcomes for international norms. Overall the effect sizes were relatively large, Cohen’s d>.50, including family strength/resilience variable for Portuguese families (d= .54) and for norms (d=.66). Combining prevention interventions to address more risk and protective factors has been found to result in even better development outcomes and highlight that SFP is one of the most effective prevention program (Foxcroft, et al., 2012) also in cost-benefit studies (Miller & Hendrie, 2008).
ENTREPRENEURS ARE NOT RISK PRONE, THEY ARE BRAVE

Artur Domurat, University of Warsaw, Warsaw – Poland

The aim of the author’s studies is to challenge the common belief that risk-taking propensity is the distinguishing trait of entrepreneurs. Entrepreneurs do not consider themselves as prone to risk, but rather as brave (Study 1, 200 entrepreneurs, CATI interview asking for entrepreneurial traits directly). Entrepreneurial do not take risk more in lottery or quiz tasks rewarded with real money (Study 2, 80 entrepreneurs, 80 employees, individual questionnaire interviews). Differences emerge when the settings are ambiguous, and outcomes of decisions depend on personal skills. Entrepreneurs turn out to be more self-confident and less prone to ask for additional information (Study 3, 27 male entrepreneurs, 36 male employees; evaluations and choices in computer-simulated tasks). When compared to employees and managers, entrepreneurs reveal greater self-efficacy, and score higher on self-reported financial but not consumer or hazard risky behaviors. They have also stronger a belief that they have greater abilities than other people in dealing with risk in different every-day situations (Study 4, 149 male and female entrepreneurs, managers and employees, individual questionnaire interviews). The results of the four studies demonstrate that not risk propensity but rather courage is a trait that distinguishes entrepreneurs from others.

THERAPEUTIC ALLIANCE AND OUTCOME RELATION: MEDIATION ROLE OF GAP BETWEEN INNER EXPERIENCES AND LANGUAGE

E16. Health and clinical intervention - Other

Cigdem Kose Demiray, Istanbul Arel University, Istanbul - Turkey
Tülin Gençöz, Middle East Technical University, Ankara - Turkey
Ömer Faruk Şimşek, Istanbul Arel University, Istanbul - Turkey

The purpose of this study is to examine perceived gap between language and inner experience as a mediator in therapeutic alliance and therapy outcome relation. One of the most important issues of psychology has been self-knowledge (know thyself!) which was originated from Thales. The belief that self-knowledge contributes to the mental health has been argued among the psychologists. However, relation of this concept to language has been limited. Language believed to provide means to have knowledge about inner experiences. Complete linguistic expression of inner experiences is considered hard to attain. When people believe that words are not enough to express inner experiences, distance between inner experience and language widens and becomes a ‘gap’. Perceived gap between language and inner experience has some consequences concerning mental health. This study aims to emphasis the importance of perceived gap between language and inner experiences on mental health. The main hypothesis of present study is that therapeutic alliance will contribute to mental health via its effect on perceived gap between language and inner experiences. Study is at data collection level, 5 scales (Beck Depression Inventory, Working Alliance Inventory, Positive and Negative Affect Scale, Beck Anxiety Inventory and Beliefs about Functions of Language Scale) are being completed by 30 clients (with depression or anxiety symptoms) in 5., 10. and 15. sessions of psychotherapy. Data expected to support the hypothesis.
O2148
THE INTEGRATION OF TELE-PSYCHOLOGICAL SUPPORT PROTOCOL FOR THE UNDERAGE FAMILY MEMBERS OF PATIENTS HOSPITALISED IN THE ICU

Elina Demetriadou, Nicosia General Hospital, Nicosia – Cyprus
Mikaella Koikkinou, Nicosia General Hospital, Nicosia – Cyprus
Nicolas Stylianides, Nicosia General Hospital, Nicosia – Cyprus
Theodoros Kyprianou, Nicosia General Hospital, Nicosia – Cyprus

It is well documented that hospitalization in Intensive Care Unit (ICU) can have negative psychological effects for the patients but also for their families, creating the need for psychological intervention. However there is a paucity in literature regarding the psychological support of family members and especially the underage, due to the fact that children have limited access to the ICU and therefore to psychological services. The main objective of this study is to enhance the accessibility of the underage family members (aged 4-18) of ICU patients to psychological services. To address accessibility challenges this study a) has exploited state of the art web and telepresence technologies and b) has developed an innovative telepsychological support protocol. The integration of the protocol was developed through the following process: a) Service User requirements assessment (surveys for parents, children and expert psychologists) and b) Delphi consensus methodology. The protocol includes: a) telepsychological sessions overcoming accessibility barriers, b) assessment tools (mental state, service quality), c) personalised interventions based on subject needs (Patients’ condition briefing, death preparation, and grief counselling), d) adolescents’ preparation for an ICU visit, e) family counselling and guide in dealing with loss. This study introduces an innovative service that could impact and guide the way children are approached therapeutically in such cases.
O2155
MOST HELPFUL INTERVENTIONS FOR EATING DISORDERS

Rebecca Curtis, Adelphi University, New York - United States
Sarah Georgiana, Adelphi University, New York - United States
Afshan Ladha, Adelphi University, New York - United States

79 respondents completed surveys online about what was most helpful in treating their eating disorders. 82% had suffered from anorexia, 74% also of some form of bulimia, and 42% of a disorder NOS. 70% had received in-patient treatment and 77% (also, in many cases) out-patient treatment. Of 65 items inquiring about the hurtfulness/helpfulness of various types of interventions—CBT, experiential, and psychodynamic—the single item most frequently rated “very helpful” (58%) was a safe place to express feelings about anything, with 85% of respondents rating his item as helpful. Next were having a sound and trusting relationship and help in increasing self-understanding (84%). Following those interventions were how patterns in the past were affecting the present (82%), understanding recurrent patterns (81%), and understanding triggers (78%). Advice, alternative ways of coping, and modifying thinking were rated by a majority as helpful, although fewer, (63-70%). Two-thirds of the respondents reported having improved, although most who had restricted continued to do so. Results suggest that talking may be more helpful than specific interventions.
O2157
INVESTIGATION OF PARTNER SELECTION IN TERMS OF ABANDONMENT SCHEMA, DOMINANT NEURAL SYSTEMS, MYTHS ABOUT MARRIAGE AND ATTACHMENT STYLES

B04. Development and education - Attachment and intimate relationships

Cenk Kahvecioğlu, Üsküdar University, Istanbul – Turkey
Yelda Ibadi, Üsküdar University, Istanbul – Turkey
Hüsnü Erkmen, Üsküdar University, Istanbul – Turkey

INTRODUCTION: Partner selection is an increasing and world spreading area of interest in recent years. Considering the latest studies in Turkey, relationship satisfaction is a broad investigation subject. Since, former studies examining partner selection include only demographics and any other study investigating biological and psychological variables of partner selection have not been conducted in Turkey, importance of this study is being the first one in its research area. AIM: The aim of this study is to investigate the relationship between abandonment schema, the dominant neural systems, attachment styles, personality traits and belief of marriage myths in terms of their effects on partner selection of young adults attending university. METHOD: 80 (74 female, 6 male) undergraduate psychology and sociology students at Üsküdar University, Istanbul, are participated in this study conducted via relational-screening model. Relationship Scales Questionnaire-RSQ, Young schema questionnaire-YŞQ/ Abandonment Schema Subscale, Fisher Temperament Inventory-FTI), Attitudes About Romance and Mate Selection Scale (ARMSS), Basic Personality Traits Inventory are used to collect data. Chi-square, independent sample t- Test, ANOVA, Regression are conducted to analyze data. RESULTS: The factors affecting partner selection are whether or not having been developed abandonment schema, dominant neural systems and obsessive attachment style. DISCUSSION: The rationale behind interaction between dominant neural systems, attachment style and having abandonment schema will contribute to appropriate partner selection.
The study of the categories of femininity and masculinity acting as normative examples in the system of gender relations, can give an understanding of changes taking place in social interaction either within the same gender or between genders. Among the main components of femininity and masculinity are gender stereotypes, containing the characteristics typically related with men’s and women’s stereotypes. The purpose of the study was to examine implicit representations about content of gender stereotypes not only in the aspect what is attributing to male or female behavior, feeling etc., but what is thought as more desirable, and also how this attribution is seen to be changed during the time. Psychosemantic approach is very effective when dealing with implicit or deep level’s stereotypes. Adjectives which are associated with masculinity and femininity most of all were used as scales. Different social roles associated with stereotypes of gender behavior were selected for evaluation (e.g., typical/ideal/happy man/woman today/previous generation ago/future generation). Four latent categories of perception and differentiation of gender roles were revealed: in/ex/ternal masculinity/femininity. The data allow to compare and to describe social desirable levels of both types of femininity and masculinity for man and woman in the society, and also representations about the dynamic of these traits during the time and to compare differences in these representations among men and women.
O2161
MODERATOR ROLE OF CHILD’S GENDER IN PREDICTING PARENTIFICATION BEHAVIORS

Busra Karagobek, Middle East Technical University, Ankara - Turkey
Basak Sahin-Acar, Middle East Technical University, Ankara – Turkey

In this study, moderator role of gender in predicting the relationship between child’s self-construal and parentification -while controlling maternal attachment- was examined. Maternal attachment was controlled since it could be related to child’s parentification. Among 92 mother-child pairs; mothers’ average age of 40.11 (SD = 5.56) and children’s was 12.56 (SD = .63). Mothers were given the Experiences in Close Relationships Inventory- II, Short Version. Children were given the Twenty Statement Scale and were asked open-ended questions about family activities. All narratives were coded on emotional and instrumental parentification dimensions. Results showed that gender was a significant moderator between independent self-construal and instrumental parentification. Moreover, child’s gender was predicting the relationship between relational self-construal and emotional parentification. To conclude, results showed that self-construal types were differentiating factors only for girls. This study highlighted the effect of individual differences on parentification of children especially for community sample.
Bullying is a pervasive problem in schools worldwide with serious consequences for students’ health and well-being. Previous research showed teachers’ interventions against bullying can play a major role in bullying prevention. The present study examined Austrian/German teachers’ (N=625; 74% female) use of intervention strategies in a hypothetical bullying episode. Factor analysis showed that teachers’ responses were best described by 5 factors. Teachers’ first preferred choice was disciplining the bully, their second preferred choice non-punitively working with the bully, and their third preferred choice involving other adults. They were less likely to work with victims or to ignore the incident. Person-oriented analyses showed that about 60% of teachers would discipline the bully without working with the victim at the same time, while only 3% percent would work with the victim while not disciplining the bully. Taken together, the findings show that teachers are focusing on disciplinary measures against bullying whereas they should better aim at using all possible strategy types to combat bullying more effectively. Thus, the results have critical implications for various stakeholders in the educational system: (1) policy and decision makers responsible for teacher education on the national and university level, (2) administrators, teachers and counselors on the school level, and (3) researchers developing anti-bullying programs.
O2167
DISGUST FEELINGS FOR ANIMALS: AN EVOLUTIONARY APPROACH

A11. General issues and basic processes - Motivation and emotion

Evrim Gülbetekin, Akdeniz University, Antalya - Turkey

Disgust is one of the basic emotions, recognizable across cultures (Ekman, 1992). People feel disgust or fear for some animals. We aim to find out which animals are perceived most disgusting and what are the main reasons underlying the disgust feeling for those animals. Our hypothesis is that we have a stronger disgust feeling for the animals those are far from humans in the evolutionary timeline. Sixty seven female and 54 male undergraduate students in Akdeniz University with a mean age of 21.39 years (SD=2.36) participated the study. A seven-point Likert-type scale was used to express the degree of their feelings of disgust and fear for 20 animals. The participants were asked to express the principal reasons for their feeling of disgust. We estimated the times of divergence between species (homo sapiens-animal) from TimeTree(Kumar & Hedges, 2011). We found that the most disgusting animal is mouse and cockroach. Snake, spider, octopus, worm and frog are also found to be very disgusting. The most frightening animals are snake, shark, crocodile, bear, wolf, mouse, octopus, spider and cockroach. We found no significant (p>.05) correlation between the feelings of disgust and fear. A significant correlation was found between the disgust feeling and the times of divergence between human and the animals (r=.63; p<.003). But no significant correlation (p>.05) was found between the degree of fear and the times of divergence between human and the animals. The degree of disgust but not fear feeling seems to be correlated with the time divergence between human and the animals. People may give disgust responses to the animals which are far from us in the evolutionary timeline due to the sense of uncontrollability and unpredictability of their responses.
This study examines the psychometric properties, via the Rasch model, of the Math Self-Efficacy Scale-Specific Tasks (MSS-ST) designed to assess the perceived capabilities of Portuguese high school students to successfully accomplish mathematical tasks. A sample of 224 10th grade students, both genders (54.0% boys), with a mean age of 15.2 years (SD = .48), answered the MSS-ST. Winsteps software was used to analyze the fit of the 15 items to a latent unidimensional structure, via the Rasch Rating Scale model. The items showed an adequate fit to a latent unidimensional structure (variance explained equals 49.0% with an eigenvalue of 2.6 for the first contrast). The 4-point scale revealed a good functioning enabling to measure with high precision persons capabilities and item difficulties. Concerning DIF gender, none of the items evidenced inadequate functioning. The MSS-ST total scores correlated with math instrumentality and value and with math grade, as it was hypothesized. Math self-efficacy proved to be a significant predictor of math grades. The MSS-ST is an inexpensive, quick, reliable, and valid instrument that can be used for research and educational assessment purposes in school contexts to measure math self-efficacy percepts and to identify those pupils who could benefit from early psychoeducational interventions to boost their math self-efficacy beliefs.
Psychologists and occupational therapists have been using cooking as a therapeutic tool in various rehabilitation and therapeutic milieus (eg. Odawara, 2005). This presentation will focus on describing a therapeutic cooking group, conducted within the context of STEP, an abuse prevention and mental health promotion program. STEP is based on attachment and early intervention concepts, aiming at early detection and prevention of problems in children’s physical and mental health, cognitive development, social and psychological adjustment. The cooking group is conducted on a biweekly basis for 1 academic year. Participants include immigrant mothers and their children less than 5 years of age. Mothers are most frequently diagnosed with some form of affective disorder while the children most frequently present with behavioral and/or eating disorders. The group is facilitated by 2 psychologists and at least 1 volunteer. We will present methods and interventions utilized, as well as group processes relevant to members’ improvement for the first 2 years the group was conducted. Preliminary results indicate that mothers improved the quality and range of their parenting skills, as well as their positive interactions with their children. Finally, children’s symptoms greatly decreased during their participation in the group. Further findings, future directions, as well as implications for prevention and mental health promotion will also be discussed in detail.
CONSTRUCTING FUTURES FOR YOUNG ADULTS WITH INTELLECTUAL DISABILITIES: IMPLICATIONS FOR CAREER GUIDANCE

D15. Work and organization - Career guidance

Mary McMahon, University of Queensland, Brisbane - Australia
Monica Cuskelly, University of Queensland, Brisbane - Australia
Karen Moni, University of Queensland, Brisbane - Australia
Anne Jobling, University of Queensland, Brisbane - Australia

This presentation considers how young people with intellectual disability and their families construct their futures and the implications for career guidance. Work is important in the lives of adults, including those with intellectual disability, and contributes to a productive and good quality of life. However, transition from school to rewarding adult lives for young people with an intellectual disability remains a challenge. This presentation reports on a qualitative research project that developed case studies of 20 Australian families each of whom had a young adult aged between 16-30 and a support person nominated by the family. The aim of this project was to develop an understanding of the aspirations of families of young adults with intellectual disability. The data were gathered by semi-structured, individual interviews with the young adult, his/her parent(s) and the support person. Inductive thematic coding was used to analyse the transcripts. Common themes across the case studies related to the importance to the young adult of employment, friendships and independence. Issues impeding the realisation of aspirations included barriers to independence, location, community networks, the role of siblings, and inconsistencies in service provision. Results suggest a role for career guidance to provide family and context relevant services that improve the social and economic participation in the community of young adults with intellectual disability.
O2179
TRANSCULTURAL INVENTORY FOR VALUES STUDY

C06. Culture and society - Attitudes and values

Olga Mitina, Lomonosov Moscow State University, Moscow - Russian Federation
Alexey Bondarenko, Lomonosov Moscow State University in Tashkent, Tashkent - Uzbekistan

Inventory is designed for measuring of personal values. Items are represented by quotes from religious sacred books - Old Testament, New Testament, Alcoran, Talmud, Tripitaka/quotes of Buddha. This idea belong to (Petrenko 2005). Inasmuch as items are quotes, from sources, which are already translated to the most number of languages, process of adaptation of this inventory in other cultures is simplified. As an axiological background of inventory was used classification of basical religious value categories. Together with them values, explicated in numerous researchs by S. Shwartz, contents of which are diverse with contents of foregoing categories were added. We constructed inventory by this way because this composition of values fully represent either religious or secular value’s sphere. Questionnaire consisted of 119 statements structured in 20 subscales. Sample characteristics – 106 respondents of different ethnic and confessional groups from Tashkent (Uzbekistan). Using Structural Equation Modeling we tested theoretical model, which suggested that all the values may be integrated in 3 general blocks – “Religious faith”, “Ethical imperatives” and “Love as acceptance of each other, tolerance, rejection of aggression and respect to environment”. We approved that experimental data correspond to theoretical model with fit-indexes CFI = 0.914, RMSEA = 0,076. Gotten results encourage for further research in this direction.
THE RELATIONS BETWEEN PERSONALITY TRAITS AND MOTIVATIONAL STYLES FOR REGULATING EATING BEHAVIOR

The aim of the present paper was to investigate the relations between 6 personality traits (i.e. extraversion, neuroticism, agreeableness, openness to experience, conscientiousness, and negative valence) and motivation styles for regulating eating behavior. With the increment of unhealthy eating habits, more and more people experience weight problems. Factors contributing to the weight issues are important points that need to be assessed in order to understand the problem and to intervene properly. According to Self Determination Theory (SDT), people’s motivational styles differ when they want to change a specific behavior. In the present study, the role of personality traits on the different motivation styles was examined. Results indicated that for autonomous motivational styles, positive personality traits were positively related, whereas negative personality traits were negatively related. The opposite direction of the relationship was shown for the relation between controlled motivational styles and personality traits except extraversion. Findings were discussed in the light of the relevant literature. Moreover, an intervention proposal was presented for eliciting the basic psychological needs, which were stated by SDT, for the patients who came to psychotherapy with weight issues.
THE ROLE OF SOCIAL AXIOMS IN PREDICTING WORK ENGAGEMENT AND JOB BURNOUT

Marshall Valencia, University of Nottingham Malaysia Campus, Kuala Lumpur - Malaysia
Hemalatha Krishnan, University of Nottingham Malaysia Campus, Kuala Lumpur - Malaysia

The Job Demands-Resources (JD-R) model predicts job burnout and work engagement through two independent processes: a health impairment process (burnout is a function of job demands and moderated by job resources) and a motivational process (work engagement is a function of job resources and moderated by job demands). This study extended the model by incorporating social axioms as a mediator that links job demands with burnout and job resources with work engagement. Social axioms are people’s general beliefs about how the world functions. We focused on two types, social cynicism and reward for application. We tested a moderated mediation model using a sample of 342 employees from Malaysia. Results showed that social cynicism mediated the relationship between job demands and job burnout while rewards for application mediated the relationship between job resources and work engagement. Job demands did not moderate the job resources-engagement link. However, job resources moderated the job demands-burnout link. Job resources in the form of voice, performance feedback, and supervisor support significantly moderated the demands-burnout relationship. The findings are discussed in terms of the importance of individual social beliefs as underlying mechanisms in the links between workplace characteristics and work outcomes.
O2187
MERLEAU-PONTY AND PSYCHOLOGY: BEHAVIOR AS FUNDAMENTAL CONCEPT

A16. General issues and basic processes – Other

Henrique Pompermaier, Federal University of São Carlos, São Carlos – Brazil

Merleau-Ponty’s proposal of overcoming classic metaphysical dichotomies (conscience – nature; cogito – extension; mind – body) has found a breeding ground in Psychology. Despite not being limited to psychological discussions, Merleau-Ponty’s work massively interrogates Psychology, examining its methods and outcomes. On his first book, The structure of behavior, Merleau-Ponty elects behavior as the main concept from which he develops his comprehension and critics for the realistic approach of science and the spiritualistic approach of philosophy. This work aims to present a conceptual analysis of Merleau-Ponty’s book The structure of behavior, guided by the following question: Why to elect behavior as fundamental concept? The answer for this question, arranged on Merleau-Ponty’s phenomenological-existential approach, indicates an intentional and dialectical comprehension of behavior, which can help Psychology to overcome its dichotomies and proceed on its efforts to consolidate this field of study.

A MULTIVARIATE LONGITUDINAL STUDY OF GENDER DIFFERENCES IN U.S. CHILDREN’S INTERNALIZING AND EXTERNALIZING PROBLEMS

B15. Development and education - Longitudinal analysis

Guang Zeng, Texas A&M University-Corpus Christi, Corpus Christi - United States

This study investigates gender differences in the developmental trajectories of internalizing and externalizing problems among children in the United States from kindergarten to fifth grade, while controlling for other sociodemographic factors that may be attributed to such differential trajectories. Presently, there is a paucity of research on the development of internalizing and externalizing problems among young children on a national scale. Data on a U.S. nationally representative sample of 9,796 kindergarteners from the Early Childhood Longitudinal Study were analyzed using bivariate mixed-effects models to simultaneously model the trajectories of both internalizing and externalizing problems. Gender differences are found in the developmental trajectories of both internalizing and externalizing problems as evidenced by their differential slopes. Specifically, boys displayed more symptoms of both internalizing and externalizing problems than girls at school entry, and that such elevated levels of problems persist into fifth grade. Higher socioeconomic status and parental report of child’s ability to pay attention are found to be protective factors for both internalizing and externalizing problems. This study fills a major gap in the literature and will contribute to the future research on the etiological factors of these behavioral problems of children. Additionally, these findings are informative for school-based early intervention efforts.
O2190
PERCEPTIONS TOWARDS ONLINE COUNSELING: BENEFITS AND CHALLENGES

F14. EXPO 2015 Hot Topics - Cyberspace and virtual realities

Zainah Ahmad Zamani, University Kebangsaan Malaysia, Bangi - Malaysia
Rohany Nasir, University Kebangsaan Malaysia, Bangi - Malaysia
Mohd Norahim Mohamed Sani, University Kebangsaan Malaysia, Bangi - Malaysia
Salina Nen, University Kebangsaan Malaysia, Bangi - Malaysia
Salleh Amat, University Kebangsaan Malaysia, Bangi - Malaysia
Aizan Sofea Amin, University Kebangsaan Malaysia, Bangi - Malaysia

Trends for the past few years have shown that online counseling are being utilized by clients and counselors. However, in Malaysia, little evidence exists that examines its effectiveness over the traditional face-to-face counseling. This study seeks to explore the attitudes of university students towards online counseling. Data was collected from 137 students from both the public and private universities using the E-therapy Attitude Scale. Demographic profiles were assessed and perceptions and concerns about using online counseling were obtained. Findings reported that although the respondents were positively convinced that online counseling is beneficial and effective but ambivalent attitudes remains. As internet has become increasingly available in most geographical locations, hence online counseling should be made available in all areas.
Most of the people having a disability in many countries are discriminated in everyday life because the society in these countries is not ready to accept a person with a disability as an equal, competitive. One reason for this is the stigmatization - the attribution of certain characteristics of others, often negative, for formal reasons into force of socio-cultural traditions, cultural policy, or their own psychological features. People with disabilities stigmatized throughout life, from childhood, not only from society, but also in the family. We are interested in the question: Is there a difference between the stereotypes of people with disabilities in family and in society, what are they? On the one hand, the family having disable person knows more about the features associated with a disability, compared with a society where most of the stereotypes are based on prejudice; on the other, family relationships emotionally overwhelmed, it affects the perception and interaction with family members, who have disabilities. The consequence, in most cases it is the choice of overprotection as communication strategies. The psychosemantic method of plural identifications was used. As descriptors items from Schwartz’s values questionnaire were used. Analysis of the results showed that many of the values are more important for families having members with disabilities (among them associated with the maintenance of social status and reputation). Research was done in Tashkent (100ss).
SELF-ORIENTED PERFECTIONISM PREDOMINATES OVER SOCIALLY PRESCRIBED PERFECTIONISM IN INFLUENCING ASPECTS OF INTELLIGENCE

Felicidad Villavicencio, Bulacan State University and De La Salle University, Manila - Philippines

Perfectionism is commonly characterized by striving for flawlessness and setting of excessively high standards for performance. Previous studies indicate that perfectionism is associated with negative psychological functioning. This study examined the nature of self-oriented perfectionism (impose high standards upon themselves), and socially prescribed perfectionism (strive to meet the standards that significant others impose on them) in relation to the three aspects of intelligence: analytical (analysis, evaluation, and critiquing), creative (discovering, creating, and inventing), and practical (using, implementing, and applying). The data were gathered from six hundred thirty adolescent Filipino students using self-report measures. Correlational results indicate that both types of perfectionism correlated positively to analytical, creative, and practical intelligence. However, regression analyses show that only creative intelligence is positively predicted by both types of perfectionism, whereas, self-oriented perfectionism positively predicts the three aspects of intelligence. Perfectionism does not have to be negative, but can also be positive. This implies that self-oriented perfectionism can be associated with high positive perfectionist strivings, complementing high expectations with high actual achievements and if they are not overly concerned about what others impose on them. Overall, the results suggest the adaptive form of perfectionism for learners in the academic context.
O2198
I CHOOSE WHAT I NEED: EFFECTS OF ‘LOCOMOTION’ AND ‘ASSESSMENT’ ON THE MAXIMIZING AND SATISFICING STYLES

A13. General issues and basic processes - Thought, decision and action

Yali Jiang, Beijing Normal University, Beijing - China
Ran Bian, Beijing Normal University, Beijing - China
Hua Ming, Beijing Normal University, Beijing - China
Yufeng Fang, Beijing Normal University, Beijing - China
Guanyu Chen, Beijing Normal University, Beijing - China
Xiaohong Li, Beijing Normal University, Beijing - China

This research investigated the relationship between regulatory mode orientations (locomotion and assessment), and decision-making styles (the maximizing and satisficing styles). “Locomotion” refers to the aspect of self-regulation involving the movement from state to state, whereas “assessment” is the comparative aspect of self-regulation that refers to the critical evaluation of alternative goals and the means for achieving them. The maximizers are more likely to pursue optimal solutions, while the satisficers prefer to seek satisfied ones. In study 1, the Chinese versions of the Maximization Scale, and the Locomotion and Assessment Regulatory Modes Scales were administered to 161 Chinese participants. The results supported the notion that locomotors and assessors differ in the ways they make decision. Assessment was positively related to the maximizing style. In contrast, locomotion was not found to be negatively related to the satisficing style. But it was positively related to the dimension of decision difficulty. In Study 2, regulatory mode orientations were experimentally induced. Participants were randomly assigned to either the locomotion regulatory mode condition or the assessment condition. All participants were asked to complete the adapted cleaning supplies task and satisfaction with choice questionnaire. The results found that induced assessor was feeling right when choosing from a larger assortment while induced locomotor was feeling right when choosing from a smaller assortment. These findings shed light on the relationship between regulatory mode and decision-making styles as well as regulatory fit effect.
THE HARMFUL EFFECTS OF MINORITY STRESSORS ON SEXUAL MINORITIES’ MENTAL AND PHYSICAL HEALTH: THE MEDIATING EFFECTS OF SHAME

C04. Culture and society - LGBTQI studies

Ethan Mereish, Center for Alcohol and Addiction Studies, Brown University, Providence - United States
Paul Poteat, Department of Counseling, Developmental, and Educational Psychology, Boston College, Chestnut Hill - United States

Sexual minorities (e.g., lesbian, gay, bisexual adults) are at greater risk for poorer health than heterosexuals (Institute of Medicine, 2011). The minority stress model posits that sexual minorities experience minority stress unique to their stigmatized identity which predicts poorer health (Meyer, 2003). Shame undermines health (Jordan, 2004); in fact, minority stress relates to increased shame (Allen & Oleson, 1999) and shame relates to poorer health (Mills, 2005); yet, there is a dearth of research on the mediating effects of shame. The purpose of this study is to examine the mediating effects of shame on the relations between stress and health. Participants were sexual minorities (N=719; 54.8% male; Mage =42.18, SD=15.04) recruited online, and completed measures of distal stress (discrimination, rejection, harassment), proximal stress (internalized homophobia, concealment), shame, and mental (depression, anxiety) and physical health (distressing somatic symptoms). Using structural equation modeling and bootstrapping, the model was an adequate fit to the data: distal and proximal stress predicted feelings of shame (βs=.35-.36) and shame predicted poorer mental (β=.80) and physical health (β=.53). Stress had significant indirect effects on health (βs=.18-.34). The results underscore that minority stressors are related to feelings of shame; consequently, shame predicts poorer health. Shame is an important mechanism to consider for future research and clinical interventions.
O2204

VICTIMIZATION IN ROMANTIC RELATIONSHIPS OF TEENAGERS: A LATENT CLASS ANALYSIS OF PROFILES

B13. Development and education - Child abuse and neglect

Martine Hébert, University of Quebec at Montreal, Montreal - Canada
Francine Lavoie, Laval University, Quebec - Canada
Martin Blais, University of Quebec at Montreal, Montreal - Canada
Mireille Guerrier, University of Quebec at Montreal, Montreal - Canada

The diversity of victimization experienced by teenagers in the context of their romantic relationships is not well documented and the differential experiences of boys and girls are rarely addressed. The purpose of this study was to explore the diversity of DV by identifying distinct classes of victimization and documenting the possible correlates of membership in each class. In the context of the population-based QuebecYouth Romantic Relationships Survey, 8194 teenagers participated. A total of 2,093 girls and 1,347 boys reported having been in a romantic relationship in the past 12 months and were questioned about their experience of psychological, physical and sexual DV. Latent class analysis (LCA) identified four classes of youth experiencing: (a) Low emotional violence (71.5%) (b) Sexual and emotional violence (18.2%) (c) Multiple forms of violence (7.2%) and (d) Physical and emotional violence (3.1%). Distinctive features were found to discriminate among classes. Youth experiencing multiples forms of DV were more likely to be female and to report a history of child sexual abuse. They also reported more injuries and post-traumatic stress following DV than youth in other classes. The findings highlight the utility of a person-oriented approach to enhance our understanding of the diversity of victimization experiences of teenagers. Results also underscore the importance of tailoring prevention efforts as a universal approach may not address the needs of vulnerable youth.
According to the strength model, self-control is a finite resource that determines capacity for effortful control over dominant responses and, once expended, leads to impaired self-control task performance, known as ego depletion. It had found that ego-depletion would decrease prosocial behaviors. Past literature indicated religious belief could promote self-control. Therefore, this study tests how religion effects prosocial behaviors after ego-depletion. In study 1, after participants completing a task requiring self-control, they were randomly assigned to a religion primed condition, or to a non-religion primed condition. Finally, participants were asked to take some pamphlets to increase sensitivity of mental health to more people. We found priming religious belief after ego depletion would increase prosocial behaviors. In study 2 and 3, participants firstly experienced ego-depletion condition. Then, religion-related words as well as control words were used as subliminal primes, and the number of charity pamphlets taken by the participant before leaving the laboratory was counted (study 2) and accessibility of prosocial related items was assessed using a lexical decision task (study 3). The results showed that participants primed with religion-related words to show stronger prosocial behavioral intentions as well as be faster at identifying prosocial items. To conclusion, religion could increase prosocial behaviors after ego depletion. These findings are important. We maybe use religion to facilitate prosocial behaviors in the competitive world which makes so many people feel ego-depleted. We also discuss different possible mechanism that may underlie this effect.
O2211

PSYCHOLOGICAL DISTRESS EXPERIENCED BY WOMEN WITH PRIMARY INFERTILITY IN PAKISTAN: ROLE OF SOCIAL AND CULTURAL FACTORS

C02. Culture and society - Family systems and processes

Sehar-un-nisa Hassan, National University of Sciences and Technology, Islamabad - Pakistan
Erum Khurshid, Ex-student Fatima Jinnah Women University, Rawalpinid - Oman

Background: Primary infertility is not only a reproductive health problem but a major social problem for women in low and middle income countries. Advance fertility treatments have brought hope but at same time have added some stressors for infertile couples like financial burden, social stigma, fear of failure of treatments etc. Earlier studies have demonstrated psychological distress is high in women who are seeking treatments for primary infertility and psycho-social factors may have a role to play. Better understanding of these factors is required to adequately respond to mental health needs of women seeking infertility treatment in these societies. The present study aimed at identification of some specific risk and protective factors for psychological distress in Pakistani women seeking treatments for primary infertility.

Method: A representative sample of (N=204) women was recruited from three infertility clinics in the vicinity of Rawalpindi/Islamabad, Pakistan. Information about socio-demographic characteristics of participants was obtained by using a comprehensive demographic sheet. Levels of psychological distress, desire to have children, marital satisfaction and degree of social support were assessed by using standard tools. Association and significance of relationship between variables was assessed by using correlation and regression analysis.

Findings: The analysis revealed that overall 82% of women reported psychological distress. Almost one quarter of women interviewed (17%-28%) reported that they do not receive adequate social support from their immediate family members to deal with the pressures of infertility. Criticism, loneliness, inquiries made by other people, fear of husband’s second marriage, quarrelsome and abusive in-laws were the most common stressors. The multiple regression analysis showed women employed status (B= -5.457; p=.000) and better family monthly income (B= -0.000018; p=.018) were the most significant protective factors for psychological distress, low marital satisfaction (B= 9.68; p=.000) and personal desire to have children (B= 1.65; p=.018) added significantly to the prediction for psychological distress.

Conclusion: Findings suggest that some specific psycho-social and cultural factors specific to Pakistani society may add to women’s vulnerability for psychological distress which can also negatively impact the infertility treatment outcomes. Interventions for primary infertility should also incorporate some advance psycho-social interventions which particularly educate families about role of specific social and cultural factors which increase infertile women’s vulnerability for emotional distress and might impact infertility treatment outcomes.
RESPONSE TOWARDS INTERVENTIONS FOR INTIMATE PARTNER VIOLENCE (IPV) IN LESS-DEVELOPED COUNTRIES

Sehar-un-nisa Hassan, National University of Sciences and Technology, Islamabad - Pakistan
Unaiza Niaz, The Psychiatric Clinic and Stress Research Centre, Karachi - Pakistan

Background: In the past few years, health and social welfare organizations from different parts of the world placed increased emphasis on designing and offering intervention programs which address intimate partner violence (IPV). These programs differ substantially depending on the theoretical approach adopted by the developers of the program and aim at either primary or secondary prevention of IPV. The standard psycho-social intervention programs and therapies for IPV are primarily based on Western models of intervention and sometimes adapted before implementation in other societies. It is believed that some specific contextual factors at individual, familial, and societal levels might have an important role to play in determining the outcomes of these programs in Muslim countries. The infrastructure, integration, and collaboration of healthcare, legal, and social service agencies in these countries is generally poor which might impact the implementation and outcome of IPV intervention programs. It is worth exploring the nature of programs run by different organizations in these countries and its outcomes which can facilitate in improving the current programs.

Aims: The research paper aims at providing (1) Review of existing literature and available evidence about the nature and effectiveness of domestic violence intervention programs in Muslim countries. (2) Explore nature of programs or services currently provided by public and private sector organizations to address intimate partner violence in Pakistan and Middle East countries. (3) Identification and analysis of specific social, economic, and cultural factors which contribute towards success and failure of these programs.

Methods: Review of existing literature to gather available evidence about the nature of IPV intervention programs and their outcomes in South-East and Middle East Muslim countries. Besides, a survey form adapted from the National Survey for Domestic Violence Intervention Programs by Tulane University/Association of Domestic Violence Intervention Programs is being used to obtain data from organizations who are currently offering intervention programs in Pakistan. Data Analysis and Findings: Appropriate data analysis procedures will be followed to analyze the quantitative and qualitative data obtained from this survey. Preliminary findings from this analysis will be shared in this conference. Detailed results from the survey will be shared through a scientific paper.

Implications: The research aims at generating evidence about the outcomes of interventions programs provided to target groups and factors contributing towards their success or failure. It will thus provide a framework/guidelines for policymakers, social workers, and clinicians in these countries to revisit and improve the current programs in light of available evidence.
HOW DO GENES AND ENVIRONMENT SHAPE OUR BEHAVIOUR? A PRELIMINARY STUDY OF G×E EFFECTS ON EMOTIONAL PROBLEMS AND FACIAL RECOGNITION

Saori Nishikawa, Hiroshima University, Hiroshima - Japan

Theoretical frameworks: In the past few years, there have been an increasing number of endophenotypic studies, which aim to form a bridge between biology and psychology. The serotonin transporter gene (5-HTTLPR) is one of the most frequently studied genes linked to personality and behaviour. The 5-HTTLPR polymorphism is based in the promoter region of the gene, with two allelic types commonly found- the long or L-allele and short or S-allele. Early studies have indicated that SS individuals are at increased risk of depression (e.g., Caspi et al., 2003). There have been concerns about how we solve problems relating to violent, aggressive, and impulsive behaviour, such as domestic violence (DV) and child maltreatment. Impulsivity is a trait often linked to psychiatric disorders, and social, biological, and psychological etiologies of treatment are necessary. Recognition of facial expressions influences emotion and social behaviours. Autism spectrum disorder (ASD) is characterized by deficits in communication and social interactions (American Psychiatric Association, 2013), and autistic-like behaviors are seen even among healthy individuals (e.g., Halliday et al., 2014). In neuroimaging investigations, associations were found between autistic traits and frontal lobe activation when the subjects were recognised negative expressions (Ma et al., 2013). A NIRS (Near-Infrared Spectroscopy) study showed that participants with PDD (Pervasive Developmental Disorder) reported reduced oxy-Hb when observing scared faces (Nakadoi et al., 2012). Early parent-child interactions influence the development of children’s amygdala and prefrontal cortices. More specifically, there is an association between infant attachment quality at 18-months and activation of the prefrontal region in emotion regulation in adulthood (Moutsiana et al., 2014). Early childhood experience with parents influences decoding processes and sensitivity during the process of facial expression of emotions in adulthood. Maternal autonomy predicted the accuracy of recognizing fear, and maternal care predicted the accuracy of recognizing sadness (Zheng et al., 2011). Individual differences in adapting to different environments could be illuminated by genetic variation. A study investigated a moderated model of 5-HTTLPR and early childhood adversities of cognitive and emotional processing in adolescence (Owens et al., 2012). In the study, it was reported that adolescents who carried the S-allele and who were exposed to early childhood adversities were less able to classify negative and neutral stimuli compared to the S allele carriers who did not experience early childhood adversities. Influences from both gene and environment increased in stability with age from childhood to adulthood (Briley&Tucker-Drob, 2014). Interpreting results from an endophenotype approach is complex. More recently, it has been suggested that SS genotype is a plasticity factor (e.g., Pluess et al., 2010), rather than a risk factor (e.g., Capsi et al., 2003). This means that carrying the SS genotype could result in both negative and positive outcomes. It is also true that the effects of gene and environment on outcome can depend on how environments were measured (van Ijzendoorn et al., 2012). There have also been ethnical differences reported in the association between 5HTT and depression (Zhang et al., 2009), as well as in brain function (e.g., Long et al., 2013). We sought to address the question of how perceived parenting might influence 5-HTTLPR and mental health problems and neural system in Japanese individuals. The purposes of this presentation are to analyse the results of gene and environment interaction on behavioural/emotional problems and neural system on recognizing faces in Japanese individuals. In study 1, we examined mediational models in which perceived paternal/maternal rejection mediates the relationship between the 5-HTTLPR genotype and impulsive behaviour. In study 2, we examined changes in the prefrontal oxy-Hb levels measured by NIRS (Near-Infrared Spectroscopy) during a facial-emotion recognition task, and factor in the influence of the 5HTTLPR gene allele type and perceived parenting. Results: In study 1, we examined mediational models in which perceived paternal/maternal rejection mediates the relationship between the 5-HTTLPR genotype and impulsive behaviour. Participants included 403 adults (152 males and 252 females, mean age = 24.20) who provided genetic data and a set of
the questionnaires (BIS11; Barratt Impulsiveness Scale-11 and EMBU; EgnaMinnenav BätraffandeUppfostran). Correlational analysis indicated that Attention Impulsivity was positively associated with Rejection Mother ($r = .150$, $p<.001$), but not with Rejection Father. Rejection from both the mother and father was associated with Motor Impulsivity ($r=.168$ for father, $r=.179$ for mother, both $p<.001$) and Total Impulsivity ($r = .139$, $p<.005$ for father, $r = .153$, $p<.001$ for mother). Using SEM (Structural Equation Modeling), we evaluated 3 models for both direct and indirect relationships between 5-HTTLPR (5HTT) and Impulsivity (IMP), via maternal/fraternal rejection (MAT/FAT). In model 1, the direct path from 5HTT and IMP was not significant across the mother and father’s analysis. Models 2 and 3 assessed the indirect influence of 5HTT on IMP through MAT/FAT. The paths of models 2 and 3 were all significant and showed a good fit between the hypothesized model and data. Furthermore, the effects of the 5-HTTLPR genotype on impulsiveness in this Japanese sample were particularly accounted for by perceived rejection from the mother or father. The effects from the parents appeared to be robust especially among males. In study 2, we examined changes in prefrontal oxy-Hb levels as measured by NIRS during a facial-emotion recognition task in healthy adults, and applied a meditational/moderational model including 5-HTTLPR gene and perceived parenting. We used 2-channel NIRS and focused on the prefrontal cortex, in line with earlier studies showing links between the prefrontal cortex and face expression recognition. Fifty-three healthy adults (male = 35, female = 18) aged 22 to 37 (Mean = 24.05 years old) provided saliva sample, a questionnaire (EMBU), and participated a facial-emotion recognition task in NIRS recordings. The correlational analysis indicated that right frontal activations on ambiguous facial task were negatively associated with rejection from father and mother ($r = -.290$ for father, $r = -.358$ for mother, both $p<.001$), and positively associated with fraternal and maternal emotional warmth ($r = .340$ for father, $r = .285$ for mother, both $p<.001$). There was a main effect of maternal rejection on RoxH (right frontal activation on ambiguous faces), and a G×E interaction on RoxH, suggesting that individuals who carry SL or LL genotypes and with higher perception of maternal rejection had lower right frontal activation than SL/LL carriers with lower maternal rejection. Finally, it was indicated that perceived parenting style played a mediating role in right frontal activation via 5-HTTLPR genotype. Furthermore, the result suggested that early-perceived parenting might influence neural activity in an uncertain situation in certain genotype. Conclusions: Study 1 showed that perceived parenting (rejection from the father or mother) interacted with genotype in relation to right frontal activation during facial-emotion recognition tasks. Among SL/LL carriers, the mean value of right frontal activation on facial-emotion recognition tasks differed according to their perceived parenting style. When the carriers of L-allele experienced positive parenting, the activations were significantly higher than those who perceived their parents as rejecting and cold. This result could be referred from the other studies which suggested that punitive parenting predicted error-related brain activity (Meyer et al., 2014), and the healthy upbringing are linked to positive development of the PFC (e.g., Hanson et al., 2013). This result is also in line with the results of earlier studies, which suggested that disturbance in the early caregiver relationship affects the neural regulation of emotion later in the adulthood (Moutsiana et al., 2014). These studies make a small contribution to the mapping of an influence of gene and behaviour on emotional problems and neural system. It may be speculated that impulsive behaviours, and the type of neural activity engaged in facial recognition tasks, are linked to early interactions with caregivers. Perceived parenting in childhood may constitute a direct factor that affects neural imaging for facial recognition in adulthood. Furthermore, it is suggested that early childhood experiences may influence emotional problems and neural activity in an uncertain situation for people with certain genotypes. These should be clarified in further studies with sufficient sample sizes and use of psychophysiological well-designed experimental tasks. It would open opportunities for further studies on clinical cohorts and children in order to clarify the links and characteristics of G×E interactions on our cognitive and emotional process.
O2216

EFFECT OF EXPOSURE TO IMMUNOSUPPRESSION DURING PREGNANCY IN WECHSLER PERFORMANCE OF CHILDREN BORN TO KIDNEY TRANSPLANT RECIPIENTS

Aim. To compare Wechsler performance of children born to Kidney Transplant Recipients (KTR) who were exposed to immunosuppression during pregnancy with unexposed children performance. Methods. Case-control study. Female KTR and their children and a control group with same socioeconomic background were invited to participate. Children were evaluated according to their age with Wechsler Scales: WPPSI, WISC or WAIS. Results. Twenty-five exposed children were assessed (mean age=11.38, SD=5.6). Twenty-three healthy children (mean age=11.44, SD=5.4) were evaluated as the control group. Fifty percent of exposed children had a score lower than 90 in global IQ vs 18.2% of non-exposed children, X² (1, n=46)=5.12, p<0.05. Exposed children group showed lower duration of pregnancy (M=33.50, SD=3.8 weeks) than unexposed (M=37.39, SD=1.3 weeks) and lower birthweight (M=2117, SD=990.694 vs M=3172, SD=530.57). Children’s Full Scale was associated with Mother’s Full Scale IQ (r=0.38, p<0.01), mother’s Beck Depression Total Score (r=-0.43, p<0.01) and socioeconomic status (r=0.56, p<0.01), although there were no differences in these variables between groups. Conclusions. Being a child of a KTR is associated with a lower than the average global IQ. Results cannot be explained totally by the exposure to immunosuppression and can be also explained by higher rates of premature delivery. A study that includes a control group conformed by premature delivered children paired by gender, age and socioeconomic status is required.
Domestic violence (DV) is a major concern within Australia. Rates of DV are difficult to establish and there is reason to believe that DV is under-reported, especially in rural areas. Gender differences across perpetration and victimization of DV have also been a point of contention within the available literature. Given the amount of contradictory research findings, the present study aimed to: 1) determine whether rates of DV differed according to geographic location; and 2) shed light on gender differences in the victimization and perpetration of DV. A Personal Safety Survey was randomly sent to 9000 households across Australia with 704 usable surveys comprising the current sample. Participants were 351 males and 344 females aged between 19 and 92. Victimization and/or perpetration of DV were assessed using the Johnson et al. (2014) Coercive Control Scale which measures situational couple violence (SCV) and intimate partner terrorism (IPT). Findings indicated that 44% of participants had experienced SCV and 21% had experienced IPT. In addition, 16% of participants had experienced some form of DV in the last twelve months. No differences were found in the rates of DV according to location. There were also no gender differences in the perpetration of DV. Some gender differences were found in relation to DV victimization, with females more likely to be victims of DV than males. Implications of the findings in relation to DV research are discussed.
In literature there are a lot of data that showing how the precocity of intervention (didactic and clinical) is an important prognostic factor in the development of Specific Learning Disorders (Bryan, 2005; Fisher, Allen, Kose, 1996; Rourke, 2005; Shalev, Manor, Kerem, Ayali, Badichi, Friedlander, Gross-Tsur, 2001; Winer, Tardif, 2004). The early recognition of subjects at risk allows to enable promptly interventions of recovery and strengthening skills, designed to reducing the impact that a DSA may have on the school career, to the emotional-motivational child's skills and his bio-psycho-social wellbeing. The project consists of two phases: the first phase for the assessment of the prerequisites affected in the learning of reading and writing in children attending the last year of kindergarten, with some tests of Battery PRCR-2 (AV1, AV3, SD3 and SD4); the second phase examin in the same population the levels of acquisition of the skills of reading, writing and arithmetic (Mt reading comprehension, DDO and AC-MT) at the end of the first and second year of primary school and the possible predictive value of indexes evaluated preschool (re-test PRCR-2/2009). The research is intended to show if the skills measured in the prerequisites (visual analysis and seriality left-right) are able to predict the future learning.
A previous psycholinguistic study on native speakers of English has demonstrated that words with closely related metonymic extensions, such as rabbit as an animal and as the meat, were recognized faster than unambiguous words in a visually presented lexical decision task (Klepousniotou & Baum, 2007). However, the previous study did not find evidence showing differences among the other types of ambiguous words. The present study attempted to improve the design of the previous study by introducing a randomly jittered inter-stimulus-interval from the time of the fixation to the appearance of the target stimulus in a trial. The study investigated five types of target words: balanced homonym (e.g., panel), unbalanced homonym (e.g., china), metaphoric polysemy (e.g., lip), metonymic polysemy (e.g., rabbit), and control words (e.g., clay). Lexical decision times between two groups of participants, English-Chinese bilinguals enrolling in a professional translation graduate program and native English speakers, were compared. The results indicated that even though the overall responses of English-Chinese translators were slower than the native speakers by 100 ms, they replicated the polysemy advantage effect. The results showed the jittered ISI useful and demonstrated that for participants who were sufficiently proficient in a second language, the organization of the mental lexicon and the access of a second language were universal across typologically distinct languages.
O2226

PSYCHOLOGICAL TREATMENT FOR ANXIETY, DEPRESSION AND THERAPEUTIC ADHERENCE IN CAREGIVERS AND CHILDREN IN TRANSPLANT ISOLATION

E13. Health and clinical intervention - Psycho-oncology and psychological support in chronic diseases

Mariana Mangin Valencia, National Autonomous University of Mexico, Mexico City - Mexico
Angélica Riveros-Rosas, National Autonomous University of Mexico, Mexico City – Mexico

Leukemia remains the main cancer in children and one medical treatment consists of Hematopoietic stem cell transplantation (HSCT). This involves prolonged hospital stays in isolation, extreme asepsis, restricted visits/activities and infectious vulnerability. Patients and caregivers suffer psychological distress, uncertainty, lack of information and poor support during these procedures. The objective of the study was to identify the psychological needs of pediatric patients and their caregivers. Twenty-one interviews and observational records in real time, helped examine cognitive, behavioral and emotional variables. Data led to an intervention aimed at preparing patients to cope with these events. Preparation involved a manualized set of interventions including psychoeducation, behavior modeling and deep progressive muscle relaxation techniques, on seventeen patient-caregiver dyads. Results revealed significant effects on anxiety and depression, and improvement on therapeutic adherence. Conclusions point that psychological preparation is an effective procedure to prevent psychological distress in pediatric patients and caregivers including resources for managing transplant-related suffering with simple, easy to learn techniques. The study contributes useful methodological and technical information on this type of patients and their medical condition. The findings point out the need to actively involve parents during hospital isolation of the pediatric patient.
This paper presents the results of a trinational study on the effects of autonomy and deviance from the group norm for personal values on self-reported happiness and life satisfaction. Using mixed community and student datasets from Germany (N = 756), Japan (N = 341), and the US (N = 436) provided an opportunity to test whether effects replicated across national and age groups. In all three samples, higher levels of autonomy were associated with higher life satisfaction and happiness. Separate analyses for young and older adults indicated that depending on societal norms, the importance of autonomy for well-being may decrease after full society membership is attained. Similarity of a participant's personal values profile to the average values profile of his/her national group predicted higher life satisfaction and happiness in the overall sample. Separate analyses for each national group, however, revealed that this was largely due to strong effects in the Japanese sample, especially for the group of working-age adults. On the one hand, these results confirm the universal importance of autonomy for well-being during latter adolescence and early adulthood, but also caution against over generalizations that ignore moderating effects of cultural differences. On the other, they indicate that in societies where “fitting in” is considered a primary goal of socialization, adherence to unusual values can explain non-trivial amounts of variance in personal well-being.
O2234
PSYCHOLOGICAL PREDICTORS OF WORK EFFICIENCY IN INNOVATIVE ORGANIZATIONS

D04. Work and organization - Well-being at work

Valentina Barabanshchikova, Lomonosov Moscow State University, Moscow - Russian Federation
Alla Kuznetsova, Lomonosov Moscow State University, Moscow - Russian Federation
Marina Zavartseva, Lomonosov Moscow State University, Moscow - Russian Federation

The study is focused on the psychological factors that contributed to work performance and satisfaction during the organizational innovations, and is based on the regulatory stress approach [Gaillard & Wientjes, 1994; Leonova, 1989, 2003], which is suitable to reveal the influence of the human functional state (HFS) self-regulation on work efficiency. The research aim - to estimate the predictors of work efficiency under innovations. The diagnostic set of methods included: the Managerial stress survey [Leonova, 2006]; Trust assessment scale [Shaw, 1997, adopted by Kupreichenko, 2008], Strategic approach to coping scales questionnaire [Hobfoll, 1994], adopted by Vodopianova & Starchenkova, 2003. The data on the sample of 814 employees of educational organizations, banks, and call-centers allowed to analyze the predictors of work efficiency in tensed conditions: characteristics of work tasks, fairness of job reward and administration, and the high level of organizational trust. The results are discussed taking into account the organizational restrictions to different coping behavior models. The acquisition of adequate psychological resources (motivational support, means of HFS self-regulation and organizationally not-restricted coping) play a key role in the effective adaptation under innovation pressure. The obtained results are recommended for the elaboration of the interventions, targeted to support high coping capacity of employees and to increase work performance.
ARE POSITIVE PEOPLE MORE HAPPY AND HEALTHY? EXAMINING THE ROLE OF PERSONALITY FACTORS

Papri Nath, Indian Institute of Management Trichy, Tiruchirappalli - India
Rabindra Kumar Pradhan, Indian Institute of Technology Kharagpur, Kharagpur – India

Existing literature in positive psychology has noted significant impact of positive emotions on health and wellbeing. The present study extends this knowledge by examining the mediating effect of psychological resilience between positive emotions and wellbeing. Moreover, the study observes the moderating role of personality factors (emotional intelligence, extraversion, and neuroticism) in building psychological resilience. The data were collected from a sample of 511 participants. Based on structural equations, the results reveal that positive emotions do not have a direct influence on physical health and psychological wellbeing, but via psychological resilience. Results further suggest that high emotional intelligence, moderate extraversion, and low levels of neuroticism strengthen the impact of positive emotions on psychological resilience. The study has major implications in theoretical advancement of positive emotions, designing of resilience development programs, and development of positive therapeutic techniques.
O2243
MEDIA CONSUMPTION, NEW TECHNOLOGY AND VALUE CHANGE

C09. Culture and society - Media and communication

Martti Puohiniemi, Independent researcher, *, Espoo - Finland
Markku Verkasalo, Institute of Behavioural Sciences, University of Helsinki, Helsinki - Finland

The study covers an era of rapid societal change in Finland in 1981-2015 during which the media market and consumption transformed from traditional journalism into high tech business due to the birth and development of the internet, and analyzes the impact of all this on values and media consumption. Are the value profiles of the commercial local radio audiences in 1985 and social media users in 2015 similar? The theoretical framework of the study is based on Schwartz’s value theory and Roger’s theory of diffusion of innovations. The study is based on the longest available time series of the SVS-values in 1991-2015 which has been extended backwards to the beginning of 1980s by using attitude estimates for the SVS-values, and combined with media data of 1985-2015. The data consists of 15,100 respondents in ten representative national samples, aged 15-75. Value change of the era (before the new fieldwork in 2015) has been small on the national level, but value differences between social groups have been remarkable. Especially the role of technological innovativeness has become more important as a source of societal distinctions, almost important as education. The findings will be interpreted in relation to the development of Finnish society. Of particular interest will be the change over time in growth values (e.g. self-direction and stimulation) and self-protection values (e.g. tradition, security and conformity) in relation to societal changes.
O2246
PRO-ENVIRONMENTAL VALUES, ACTIONS AND POSTMODERN POLITICS

F21. EXPO 2015 Hot Topics - Environment and sustainability

Martti Puohiniemi, Independent researcher, Espoo – Finland

Kim Zilliacus, Swedish School of Social Science, University of Helsinki, Helsinki - Finland

The aim of the study is to analyze protecting the environment as a value, and in relation to pro-environmental actions and diffusion of new technology. The theoretical framework of the study is based on Schwartz’s value theory, Roger’s theory of diffusion of innovations, and Inglehart’s distinction between materialism and postmaterialism. The data (N≈8200) is collected in 1991, 1995, 1999, 2001, 2005 and 2015 in Finland. The time series includes SVS-inventory and measures of technological innovativeness each year, measures of pro-environmental actions in four years, Materialism–Postmaterialism scale at the beginning and at the end, and Environmental Motives Scale in 2015. According to the results the importance of protecting the environment which is a growth value decreased steadily although the state of the environment improved from 1991 to 2005 while it should have decreased according to the theory. In the spring of 2015 the situation is different compared to the previous years due to the climate change and new political threats. The study will find out if the relationships between protecting the environment as a value, pro-environmental behavior, and new technology has changed while new technology has developed into more personal, social and interactive direction. The role of new technology in protecting the environment at present and before will be discussed as well the possibility to distinguish postmaterialism and postmodern from each other.
Present study aims to identify whether self-compassion can be utilized as a strategy to break the link between early maladaptive schemas and psychopathological symptoms. As postulated in Schema Theory, this link is catalyzed by the distorted function of healthy adult mode, which counters distorted cognitions and protect the self-integrity. On the bases of the main postulations of schema theory, one can foresee that people, who have higher levels of self-compassion, are more likely to overcome with early maladaptive schemas and they are less likely to display psychopathological symptoms. As a recently popular emotion regulation strategy, self-compassion can be viewed as the beginning of a process that leads to a stronger healthy adult mode. In this regard, Young schema questionnaire, Self-compassion Scale and Brief Symptom Inventory were employed for data collection. The link between maladaptive schemas and psychopathology was examined for different levels of self-compassion. Accordingly, higher levels of self-compassion (i.e. people low in self-judgment, isolation and over identification) is associated with lower levels of maladaptive schemas and psychopathological symptoms. Although integrating third wave of cognitive behavioral therapies with different clinical practices are recommended, the question whether it is useful to integrate self-compassion strategies to the schema therapy practices to enhance the healthy adult mode is not empirically validated so far.
THE CURVILINEAR EFFECT OF PERSONALITY ON TASK AND SAFETY PERFORMANCE: MODERATION OF SUPERVISOR SUPPORT

D12. Work and organization - Safety culture and climate

Yongjuan Li, Institute of Psychology, Chinese Academy of Sciences, Beijing - China
Xiao Yuan, Institute of Psychology, Chinese Academy of Sciences, Beijing - China
Yaoshan Xu, Institute of Psychology, Chinese Academy of Sciences, Beijing - China

Personality trait is a valid predictor to job performance and their relationship has been assumed to be linear. Recent evidence has challenged the linear assumption, suggesting an invert-U curvilinear relationship. According to conservation of resource theory, personality traits are personal resources and supervisor support are social resource. Both can benefit to facilitate job performance. When necessary, social resources can become substitute of personal resources. Hence, the purpose of the current study was: (1) to explore the curvilinear effect of personality traits, which including Conscientiousness, Emotional Stability, and Extraversion on task and safety performance, respectively; (2) to investigate the moderating effect of perceived supervisor support on the curvilinear personality–performance relationships. Two studies have been designed. In study one, 323 employees from 3 nuclear power plants completed the personality questionnaire and their supervisors rated their performance. In study two, 223 operators from 35 teams of another 4 nuclear power plants completed both personality and supervisor support questionnaire and their supervisors rated their performance. The results supported the curvilinear effects of all three personality facets on multi-dimension performances, respectively. Specifically, personality-performance relationship was initially positive as personality trait increases but to a point it turned negative when personality trait increases further. Supervisor support can respectively moderate the curvilinear relationships except Conscientiousness, such that when operators perceived high levels of supervisor support the curvilinear relationship was weaker than when they perceived low levels of supervisor support. At last, the theoretical and practical implications were discussed.
O2257
THE PASSION SCALE: FACTORIAL AND DIVERGENT VALIDITY AMONG FINNISH PROFESSIONALS

D04. Work and organization - Well-being at work

Jennifer Pickett, University of Jyväskylä, Jyväskylä - Finland
Taru Feldt, University of Jyväskylä, Jyväskylä - Finland
Anne Mäkikangas, University of Jyväskylä, Jyväskylä - Finland
Johanna Rantanen, University of Jyväskylä, Jyväskylä - Finland

In modern world, psychological technologies are deeply integrated in everyday life of people (for example, “Flying Lady” can be seen as a technology of weight management and fitness). Thus, there is a strong need to study how people adopt, utilize and develop these new technologies. For this purpose it is necessary to address several issues of psychological technologies. First, it is necessary to recognize that technology is a key element of human activity. Applied to human activity technologies have several specific structural and functional properties. Structural properties include chronotopic structure, modality, and intensity of activity (Podshivalkina, 1997). Functional properties include generalizability, consistency, integrity, and objectivity of technologies. The necessity for application of technologies can be determined by three reasons: time scarcity, limitation of resources, the need for regular replacement of individual actions, and need of sustainable performance. Based on that, three basic principles of integration of these technologies into professional psychological practice can be allocated: the principle of integrity, comprehensiveness, and consistency with long- and short-term goals. Finally, this paper focuses on how these principles can be applied to the analysis of effectiveness of clients' technologies of life.
INVESTIGATING ITEM BIAS IN THE SOUTH AFRICAN SUBSTANCE USE CONTEXTUAL RISK INSTRUMENT

South Africa has a high prevalence of substance use disorders, most of which are affecting adolescents. Literature pointed toward the need for an instrument which would be able to validly measure the contextual factors associated with adolescent substance use in low socio-economic status communities in South Africa. The South African Substance Use Contextual Risk Instrument was therefore developed to capture these contextual realities from the subjective point of view of adolescents. The instrument serves as a means to identifying at-risk youth and communities in which risk factors are present. Exploratory research on the reliability and validity recommended that a DIF analysis be done on six of scales on the measure which proved to not be equivalent across the two language versions. This study aimed to: 1) establish whether items function differently across the two language versions, 2) identify problematic items on the six scales and 3) inform the process of rewriting these items. Item bias was investigated using two well supported statistical procedures; Ordinal logistic regression and the Mantel-Haenszel method. Literature supports the use of multiple procedures to verify findings. All items which were flagged by either of the two methods as presenting with moderate to large DIF were noted. It is suspected that the removal or revision of these items from the instrument may increase the validity and provide evidence for equivalence across the two language versions.

TREATMENT OUTCOME EVALUATION: AN EXAMPLE OF INTEGRATED FOCAL PSYCHOTHERAPY IN A PSYCHOSOCIAL TREATMENT CENTRE

E05. Health and clinical intervention - Evidence based psychotherapies

Silvia Galvani, Azienda Ospedaliera “Ospedale Maggiore”, Crema – Italy
Claudio Maria Maffini, Azienda Ospedaliera “Ospedale Maggiore”, Crema – Italy
Giuseppina Facchi, Azienda Ospedaliera “Ospedale Maggiore”, Crema – Italy

Introduction: The current presentation reports the results from a four-year longitudinal project (2009 to 2013) that was conducted at the Psychosocial Treatment Centre of the Mental Health Department of the Ospedale Maggiore (Crema, Cremona). The main purpose of the project, which saw the participation of psychiatrists and psychotherapists, was the expansion of the service provided with an integrated (pharmacological treatment and psychotherapy) focal (identification of a treatment focus) and brief (treatment duration between 6 and 18 months) service to patients with a specific age range (18-50 years of age) and diagnoses (anxiety disorders and personality disorders). Methods and Procedures: Patients (N=230) filled out the Clinical Outcomes in Routine Evaluation Outcome Measure (CORE-OM) at three separate times of treatment (beginning, end, and follow-up). Thus, any changes to the patient’s mental condition was recorded.

Results: The average number of psychotherapy session was 15 for patients diagnosed with anxiety disorders and 25 for patients diagnosed with personality disorders. Statistical evaluation of psychotherapy treatment efficacy yielded a significant difference between beginning and end of the intervention, underlining an overall improvement of the patient’s mental condition. This improvement remained constant even at the follow-up time, 6 months after treatment termination. The report will discuss these findings in light of future projects.
DO CONSUMERS INFER ABOUT THE CAUSES OF SUCCESS AND THE CAUSES OF FAILURES OF COMPANIES IN THE SAME WAY?

The presentation reports the results of an experimental study involving 800 students who were asked to evaluate the image of different companies in the Polish market. A covariation model based on Kelley’s theory implying three factors: consensus, distinctiveness and consistency was adopted in order to examine the role of causal and dispositional attribution in the perception of companies. The experimental stimuli were framed as companies either in the mode of employing staff or dismissing staff or successfully launching of a new product or unsuccessful launching of a new product. The results show that successful companies were perceived as open, innovative and stable. Unsuccessful companies were viewed as less innovative and unstable. The outcome displayed numerous biases in the perception of success and failure, e.g. an asymmetry in success vs. failure attributions, such that the company’s role in creating success is underrated whereas its role in creating failure is overrated. The results show that successful companies were perceived as open, innovative and stable. Unsuccessful companies were viewed as less innovative and unstable. This implies that the companies’ losses are detrimental to their images. Other implications are also discussed.

ETHNIC IDENTITY OF TRANSRACIAL ADOPTEES AND IMMIGRANTS

B07. Development and education - Social cognition, identity and social interactions

Laura Ferrari, Catholic University of Milan, Milan - Italy
Claudia Manzi, Catholic University of Milan, Milan - Italy
Rosa Rosnati, Catholic University of Milan, Milan - Italy
Maria Brambilla, University of Bergamo, Bergamo - Italy

Ethnic identity is largely considered central to the normative development of ethnic minority youth and plays also an important role contributing to their well-being (Umana-Taylor et al., 2014). The ethnic identity formation is particularly salient during adolescence and continues to unfold through emerging adulthood involving the construction of one’s sense of self associated with group membership. The literature has been mainly focused on ethnic identity of immigrants whereas transracial adoptees reflect an understudied population whose migration histories are quite distinct from children raised in biological families. The development of ethnic identity could be peculiarly challenging for transracial adoptees because they don’t share their ethnic background with adoptive parents (Sherman, 2010). Nevertheless, there is still a paucity of studies comparing immigrants with transracial adoptees about ethnic identity (Lee, et al., 2010). In this study we explore how immigrants compared to transracial adoptees cope with the construction of their ethnic identity, identifying which factors could facilitate this process which in turn influences their well-being. A self-report questionnaire was administered to 168 immigrants and 160 transracial adoptees, for a total of 328 participants. Data analyses are still in progress and the results will be discussed in relation to implications for intervention with immigrants and adoptees adolescents and emerging adulthood. Keywords: Ethnic identity, Immigration, Transracial Adoption, Well-being.

YOUNG CHILDREN'S FOOD VS. NON-FOOD CATEGORIZATION ABILITIES DURING FOOD NEOPHOBIA PEAK

F02. EXPO 2015 Hot Topics - Nutrition, development and well-being

Camille Rioux, Aix Marseille University, Aix-en-Provence – France
Jeremie Lafraire, Institut Paul Bocuse, Lyon – France
Agnès Giboreau, Institut Paul Bocuse, Lyon – France
Delphine Picard, Aix Marseille University, Aix-en-Provence – France

Background: Food neophobia, or the reluctance to eat novel foods, peaks at around 2-6 years during childhood. At the same period, a food categorization system is assumed to develop, but few studies have yet investigated the characteristics of this system or its possible relation with food neophobia. Objective: This study assessed young children’s abilities to discriminate between food and non-food items, and their relation to food neophobia. Method: A sample of 42 children, aged 36-53 months, participated to a rapid categorization task in which they were presented with color photographs of food and non-food items for 80 ms. Their task was to respond as quickly as possible whether or not each item was edible. Both accuracy measures (hits, false alarms, discriminability) and response times were recorded. Children’s food neophobia was assessed using a standardized scale. Results: Children showed a high rate of hits (81%) and false alarms (50%) to the rapid categorization task. Discriminability and neophobia both increased with age, whereas response times decreased. There were no significant correlations between categorization performances and food neophobia scores when controlling for age effects. Conclusion: The food categorization system present in children aged 3-4.5 years is under construction, and rather liberal as it accepted a large amount of non-food items as edible. Relations between categorization abilities and food neophobia should be tested with larger age range.
The automotive industry is concerned about (i) anticipating the future usage behaviors, (ii) predicting the intention to use the innovative systems unknown by the public and (iii) helping those systems to be acceptable by the persons. The aim of this study is to predict unknown behavior. The theoretical model is inspired by the Planned Behavior Theory (Ajzen, 1991). In this study, we seek to predict the intention to use the Cooperative Intelligent Transport Systems (C-ITS) towards which the individuals have no attitudes. We assume that (1) attitudes towards new technologies indirectly predict intention to use C-ITS via the attitudes towards ITS and the confidence in the C-ITS; (2) there is a direct relationship between attitudes towards the new technologies and the intention to use the C-ITS; (3) the subjective norm and the perceived behavioral control both specific to C-ITS are direct determinants of the intention to use the C-ITS. The initial model was tested on a first sample of 336 participants. Next, the model was validated on a second sample of 336 participants. All paths predicted by the theoretical model were significant except the direct link assumed between the perceived behavioral control and the behavioral intention. This relationship is mediated by confidence in C-ITS. In sum, the results indicated that the modified model fits the data to a satisfactory extent.

THE PREDICTION OF ATTRIBUTIONAL STYLES ON THREE-DIMENSIONAL MODEL OF PERFORMANCE ANXIETY

A11. General issues and basic processes - Motivation and emotion
Jose Ricardo Chafloque Alvan, University of Taipei, Taipei - Taiwan, Province of China
Wen-Nuan Kara Cheng, University of Taipei, Taipei - Taiwan, Province of China

BACKGROUND Attribution (Phelps, & Ellis, 2002) refers to individuals’ casual explanations for their success or failure. Attribution theory asserts that people differ in their attributional style and that these differences contribute to motivation, performance and affective reactions to various life experiences. Attributional style has been examined as a source of anxiety, particularly in educational setting (Anshel & Brinthaupt, 2006). However, very few research has examined the relationship between attributional style and anxiety, particular among collegiate athletes. Consequently, the present research examined the prediction of attributional styles on the three-dimensional model of performance anxiety (Cheng, Hardy, & Markland, 2009) in collegiate athletes in Taiwan. METHOD: Data was collected from college-based sport participants (N=416), and analyzed via stepwise regression. The measures were Attributional Style for Success and Failure Questionnaire (including four dimensions of ability, effort, task difficulty and luck), and Three-Factor Anxiety Inventory (i.e., Cognitive, physiological and the regulatory dimensions). RESULT: Regression analyses revealed that the ability attribution for success best predicted the regulatory dimension of anxiety ($\beta = .28, p <.001$), and also predicted cognitive anxiety ($\beta = .17, p <.001$). In addition, the ability attribution for failure predicted cognitive anxiety ($\beta = .10, p <.05$). DISCUSSION: Among the four dimensions of attribution style for success and failure, the ability attribution appeared to be the main predictor for the regulatory anxiety and cognitive anxiety. Implications of the present findings are discussed in light of three-dimensional model of performance anxiety.
Far Eastern University (FEU) Project Hope is one of the community extension programs of the university to help transform holistically the lives, alleviate the plight and ameliorate the socio-economic condition of the Manila City Jail Bureau of Jail Management and Penology (BJMP) incarcerated women. The psychological profile of the incarcerated women from the study of Ormita and Perez (2012) described them having regrets of their past and put up with their feelings of insecurity and poor self-concept. They utilize negative coping mechanisms and are likely to use avoidance, passivity, regression and tend to react emotionally in response to stress. There were 83 women inmates who were identified by the institution because of their overt aggressive behaviors towards other inmates or towards jail officers. They underwent a two-phase anger management module to understand the causes of their impulsive and aggressive behaviors and learn how to manage their anger consequently developing empathy. Results showed that women inmates who finished elementary schooling tend to be hostile than those who finished secondary or tertiary education while those who commit kidnapping tend to be physically aggressive. Further, inmates who were considered recidivists were found to be hostile. However, no significant differences were found on the empathy of the participants on all demographic characteristics. Linking impulsivity and empathy, all subscales of impulsivity which are verbal aggressiveness, anger and hostility proved to be significantly correlated with their personal distress.

INFLUENCE OF USER’S PREFERENCES AND SPATIAL ABILITIES ON CRITERIA TO CHOOSE A ROUTE IN PUBLIC TRANSPORT

D10. Work and organization - Traffic and transportation

Elise Grison, Université Paris Descartes, Versailles, France
Valérie Gyselinck, Université Paris Descartes, Versailles, France
Jean-Marie Burkhardt, Université Paris Descartes, Versailles, France

Planning a route in public transport (i.e., PT) is a difficult task involving various spatial cognitive abilities, users’ preferences (e.g., attitudes, criteria) and context (e.g., getting to work or going to a leisure activity). While the effects of users’ preferences and context are well established, the role of spatial abilities and their interactions with the others factors are still few explored in the choice of PT route. This study aims to explore these effects when we are exposed users to a choice between two PT routes. Participants are frequent users of the PT of Paris and its suburbs. They are presented short descriptions of PT routes which vary as a function of number transfers, the travel time, the comfort, and the context. Spatial abilities are evaluated through scales and tests (SBSODS, Corsi blocks). Additional individual determinants of choice are considered, including demographic variables, individual attitude toward PT and the individual personal hierarchy of criteria. Results show that the choice toward a comfortable PT route with 3 different PT modes is mainly oriented by the longer of the route, a good perception of PT and the habit to use routes combining several modes. Conversely, the choice toward an uncomfortable PT route with only one mode is oriented by gender (mainly men), the high level of spatial abilities, the preference for route with only one mode and a high perception of PT disadvantages.
The purpose of this study is to determine the relationship between level of psychological well being and sociodemographic variables, self efficacy, parental attachment, social comparison in 309 university students. Socio-demographic information form was used for obtaining personal information in the research. In addition to this, Psychological Well Being scale, Parental Attachment scale for measuring dimensions of cognitive and emotional attachment to their parents, General Self Efficacy Scale for measuring the level of self efficacy and Social Comparison Scale for measuring the level of social comparison was used. The results were analyzed by SPSS (Statistical Package for Social Sciences) Windows 21.0 program. As a result, psychological well being of university students showed difference according to variables of gender, perceived academical success, perceived health and regarding as a shy. It is possible to say that statistically significant positive correlation has been observed between the level of psychological well being and parental attachment, self perception, general self efficacy. There is a strong correlation between level of positive relations with others, level of environmental control, level of purpose of life, level of self acceptance, the level of general psychological well being and parental attachment, general self efficacy, self perception variables.
The aim of the study was to investigate the role of cognitive emotion regulation strategies as predictors of excessive reassurance-seeking (ERS). ERS has been defined as excessively seeking reassurance from others to reduce one’s doubts about self-worth and lovability (Joiner et al., 1999). Research shows that ERS is a contributor to depressive symptoms and negative interpersonal outcomes such as social rejection (Joiner et al., 1999; Joiner & Metalsky, 2001). Five hundred and five (505) university students participated in the study and completed the Cognitive Emotion Regulation Questionnaire (Garnefski et al., 2001), White Bear Suppression Inventory (Wegner & Zanakos, 1994), The Depressive Interpersonal Relationships Inventory (Joiner et al., 1992) and Beck Depression Inventory (Beck et al., 1988). Results of the multiple regression analysis indicated that when depressive symptoms were statistically controlled; thought suppression, catastrophizing and rumination significantly predicted ERS. This finding suggests that one of the proximal precursors of ERS may be the dysregulation of emotion. Theoretical considerations and implications for psychotherapy will be discussed. Keywords: Excessive reassurance-seeking, emotion regulation, cognitive emotion regulation.
Augmentative and Alternative Communication (AAC) is a set of strategies and technologies that an individual with limited or no speech uses to communicate. The purpose of this study is to investigate how attitudes and emotions toward AAC technologies affect their use. AAC is broadly used with children with autism, cerebral palsy, etc., as well as with adults with acquired conditions such as aphasia or ALS. Technology plays an important role in AAC because it allows a user to express its needs by using customized symbols. AAC technology is also used from a communication partner, such as a parent, to communicate with the user that have comprehension difficulties. AAC technology has often carry the stigma of the disability because of its clumsy looking and its unfriendly user interfaces. Research studies stated that these features may cause anxiety, frustration and negative attitudes which have an impact on the use of an AAC technology to the point that in the long terms it may lead to its abandonment. With the advent of mainstream technologies such as iPads, AAC may have found a way to eliminate the stigma from technology because of their fashionable looking and user friendly interfaces. Considering these features it is very important to investigate how the use of an iPad as an AAC technology impact on attitudes and emotions of both AAC users and communication partners. It is also interesting to verify if in the long terms this technology may affect the abandonment of the AAC.
THE ROLE OF INDIVIDUAL VALUES AND POLITICAL VIEWS IN TRUST IN THE MEDIA IN RUSSIA

C06. Culture and society - Attitudes and values

Alyona Khaptsova, National Research University Higher School of Economics, Moscow - Russian Federation

The literature suggests that individual values influence political views, which, in turn, influence trust in news messages. Yet, trust in messages depends not only on individual characteristics. Trust in the media as an institution and trust in particular news channels may mediate this relationship. This study tests whether individual values influence 3 levels of trust in the media (trust in the media as an institution, trust in Russian vs. foreign news channels, trust in particular news messages) both directly and through political views. As Russian government owns controlling stake in the most popular news channels we hypothesize that holding tradition values may be associated with sharing progovernment political views, trust in Russian news channels and trust in progovernment news messages. In contrast, holding universalism values may be associated with liberal political views, trust in foreign news channels and trust in antigovernment messages. Hypotheses were tested using SEM with a sample of 149 adults who live in Russia. Results of the analysis revealed that people who hold tradition values are likely to share political views of the government and trust Russian news channels. Holding progovernment political views increase trust in the media as institution and decrease trust in antigovernment message. In contrast, those who hold universalism values don't share political views of the government, they trust antigovernment message and don't trust progovernment message.
The present study would address two key limitations in the current research on restorative environments. First, to address the lack of research examining restorativeness of social environments, we explored the perceived restorativeness and attentional restoration afforded by social compared to natural environments. Second, we explored the role of extraversion in moderating the restorativeness of those environments. A mixed between subjects and within-subjects design was used. About 150 participants were exposed to a task built to induce attentional fatigue (Sustained Attention Response Test (SART)). Participants were then randomly assigned to four experimental conditions whereby they observed one of four different environments: natural setting, social setting on neutral background, urban setting, social setting on natural setting background. Participants then completed the task for a second time. Level of attentional restoration will be examined by comparing pre and post SART reaction times and correct responses for each of the experimental conditions. Consistent with previous work, exposure to urban settings is expected to provide the least restoration. In contrast, it is anticipated that participants exposed to natural settings will experience the greatest restoration as shown by improvements in reaction times and correct responses. We also expect that social environments will have restorative utility, but this will be moderated by the participant’s level of extraversion.
O2323
THE ONLINE LOOKING GLASS: THE STUDY OF SELF ESTEEM AND NARCISSISM ON SOCIAL MEDIA

C09. Culture and society - Media and communication

Charles Mitchell, Independent Researcher, Independent Researcher, Kuwait City - Kuwait
Juliet Dinkha, American University of Kuwait, Kuwait City - Kuwait
Bashar Zogheib, American University of Kuwait, Kuwait City - Kuwait

Our study (currently in progress) investigates the effects of social media on self-esteem and the expression of social media activity as a form of narcissistic behavior. Our research duplicates the study conducted in Canada entitled Self-Presentation 2.0: Narcissism and Self-Esteem on Facebook by Soraya Mehdizadeh, B.Sc and published in Cyberpsychology, Behavior, and Social networking(2010). In that study, Mehdizadeh investigated the effects of self-esteem and narcissism found on Facebook by examining and surveying 100 users of the social media platform. Online social networking sites have revealed an entirely new method of impression management and self-expression on social media acts as a medium for studying self-image and as a platform for communicating low self-esteem. Psychologists describe self-esteem as a person’s overall evaluation of their self-worth; while narcissism is defined as persistent displays and patterns of self-importance (Mehdizadeh 2010). Our study focuses on the narcissistic personality disorder as an overriding theory. According to Mayo Clinic Staff (2011), narcissistic personality disorder is characterized by dramatic and emotional behavior. The disorder's symptomology may include believing that one is better than others and that one is special, but at the same time that same person is easily hurt and rejected, expecting constant praise and admiration, and has fragile self-esteem. In our research, we attempt to ascertain if we can observe these characteristics based on what is posted on Instagram on a wide sample of users. We derived our sample from Saudi Arabia and Kuwait. We used these two countries because they have some of the highest penetration of social media in the world and the study of the effects of social networking on the population, especially among the youth is a subject matter that demands.
O2325
USING GAMIFICATION TO FOSTER MOTIVATION AND PERFORMANCE IN THE WORKPLACE

D14. Work and organization - Workplace learning and training
Michael Sailer, Ludwig-Maximilian-University of Munich, Munich - Germany
Heinz Mandl, Ludwig-Maximilian-University of Munich, Munich – Germany

This empirical study investigates the innovative concept of gamification from a psychological perspective. The idea of gamification is to use game design elements in a non-game context to enhance motivation and performance. This study investigates the motivating power of gamification and helps to fill the empirical and theoretical gap regarding psychological research on gamification. Therefore a self-determination theory perspective is applied to investigate effects of game elements like points, badges and stories on basic psychological needs for competence, autonomy and social relatedness. Furthermore effects of gamification on intrinsic motivation and performance will be investigated. An experimental control group design was conducted in the context of intralogistics. Hereby trainings of new and untrained workforce have been gamified within an artificial storage depot setting and compared to a traditional instructional design setting. Results show positive effects of a gamification training environment compared to a traditional direct instruction training environment regarding competence, autonomy and relatedness need satisfaction as well as intrinsic motivation and performance. This study shows that in barely stimulating working and learning contexts like intralogistics, gamification is an effective concept to foster motivation and performance. Self-determination theory has proven its worth as a suitable approach to investigate gamification and its motivational power.
